By the use of a MoAb (B72.3) specific for a high molecular weight antigen (TAG-72) on cells of a colorectal carcinoma grown in nude mice, optimal chemical conditions for MoAb conjugation of those ligands and of the dicyclic and isobutylcarboxy carbonic anhydrides of DTPA and subsequent ^{111}In labeling were determined. All conjugates were shown by a competitive binding assay to retain their specificity and activity in vitro when less than one ligand is protein coupled both prior to and after ^{111}In labeling. Chemical methods for purification of the MoAb were systematically investigated by injection of purified immunoprotein into athymic mice bearing LS-174T tumors that express the TAG-72 antigen. Tissue distribution studies revealed that simple addition of EDTA to labeled immunoglobulins was ineffective at complexing indium not linked to protein by chelates. Similarly, gel chromatography (Sephadex G-50) was not sufficient; rather, size exclusion HPLC had to be employed to remove unreacted ^{111}In and aggregated antibody. To compare the relative utility of the four chelates for ^{111}In diagnostic radioimmunoimaging, scintigraphic images of tumor-bearing mice were obtained and evaluated along with tissue distributions. Results showed that clear images of these solid tissue tumors free of extraneous radiation could be obtained only by using p-SCN-Bz-DTPA purified by HPLC. Methods developed are now being employed in clinical trials for diagnosis of human colorectal cancer. 71 references, 5 figures, 1 table.

16842 **DNA synthesis studies in pre-meiotic mouse oogenesis.** Sung, W.K.; Hof, J.V.; Jagiello, G. (College of Physicians and Surgeons of Columbia Univ., New York, NY). *Experimental Cell Biology;* 163: No. 2, 370-380(Apr 1986).

DNA fiber autoradiography was used in mouse oogenesis to test Callan's hypothesis that a longer S phase results from a reduction in the number of active initiation sites. The data indicated that the premeiotic increase in the duration of S phase in mouse oogenesis was characterized by a rapid initial rate of chain growth and a larger replicon size when compared with replicating DNA of somatic mouse cells. These findings were at variance with those in mouse spermatogenesis and also did not support the Callan hypothesis of activation site repression.

16843 **Resource utilization by desert quail: time and energy, food and water.** Goldstein, D.L.; Nagy, K.A. (Univ. of California, Los Angeles). *Ecology (English Translation);* 66: No. 2, 378-387(Apr 1985). Contract AC03-76SF00012.

Time-energy budgets (TEB) of Gambel's Quail (Callipepla gambelii) were compiled during two summers in the Colorado Desert of California. Quail spent 6.77 h/d foraging, 6.2 h/d inactive during daylight hours, and 11.02 h/d inactive at night. Field metabolic rate (FMR) calculated from this activity budget was 81.8 kJ/d. Of this, 47.3 kJ/d was expended during foraging, 12.6 kJ/d in daytime inactivity, and 20.4 kJ/d in nighttime inactivity. Despite the extremely hot thermal environment (maximum ambient temperature $\approx$45°C), there was no energy cost above resting levels for thermoregulation. FMR was also measured simultaneously with doubly labeled water (DLW), and averaged 90.8 kJ/d. The FMR of C. gambelii was only 40% of that predicted for a bird of its body mass. Energy assimilation efficiency, measured in laboratory feeding experiments with a mixed seed and arthropod diet, was 60.3%. An individual quail in the field thus required 150.3 kJ/d in its diet, representing a dry matter intake of 8.1 g/d. It was calculated that over the course of a year, a population of Gambel's Quail consumes seeds with a total energy content $\approx$15% as great as that in seeds consumed by a population of desert rodents or harvester ants in the same area. Gambel's Quail thus may be important factors in the competition for resources among desert granivores, particularly because they can eat one of their competitors (harvester ants). 44 references, 2 figures, 7 tables.

16844 **(INIS-mf—10552) Application of ionizing radiation in food and feeds processing. Proceedings of seminar.** Hanis, T. (ed.). (Ceskoslovenska Komise pro Atomovou Energii, Prague). 1985. 36p. (In Czech). (CONF-8411284—). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700732.

From Seminar on application of ionizing radiation in food and feeds processing; Prague, Czechoslovakia (1 Nov 1984).

The seminar heard 8 papers whose topics were: safeguarding the development and testing of RIA kits for veterinary medicine; radicidation of fish meal; effects of radiosterilization on changes in vitamin A content in different fats in mixtures with cereals; technology of radiation processing of feed mixtures and litter for laboratory animals; methods of determining radiation processing of onions; operation of industrial irradiation plant GBZ 81 near Leipzig used for the radurization of onions; replacement of pesticides with radiation disinfestation; radiation sources for irradiation of foods and feeds. (J.P.).

16845 (INIS-mf—10552, pp 7-8) **CSKAE activity in the field of ionizing radiation applications in agriculture and food industry.** Schweiner, Z. (Ceskoslovenska Komise pro Atomovou Energii, Prague). 1985. (In Czech). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700732. (CONF-8411284—).

From Seminar on application of ionizing radiation in food and feeds processing; Prague, Czechoslovakia (1 Nov 1984).

The results are briefly summed up attained in implementing the nuclear programme in agriculture, namely in the development and clinical testing of RIA kits for use in veterinary medicine. (J.P.).

16846 (INIS-mf—10552, pp 12-16) **Changes due to radiation or thermal sterilization in vitamin A level, acidity number and peroxide value of various fats in mixes with cereals.** Hanis, T.; Pospisil, M.; Klir, P.; Bondy, R.; Mnukova, J.; Krejci, P. (Ceskoslovenska Akademie Ved, Prague. Fyziologicky Ustav; Institut Hygieny a Epidemiologie, Prague, Czechoslovakia; Vyzkumny Ustav Veterinarniho Lekarstvi, Brno-Medlanky, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700732. (CONF-8411284—).

From Seminar on application of ionizing radiation in food and feeds processing; Prague, Czechoslovakia (1 Nov 1984).

Experiments were carried out oriented to destruction changes in fats caused by radiation or heat treatment of food and feed materials. The objective was to find a fat with the highest stability for radiation decontamination and the storage of cereal based diets. The destruction was monitored of vitamin A as the vitamin most sensitive to the efects of ionizing radiation, changes in values of acidity and the peroxide value. The smallest losses of vitamin A and the highest resistance in storage conditions were found in radiation processed mixes containing pork fat and germ oil. (Pu).

16847 (INIS-mf—10552, pp 17-23) **Radiation processing technology for feed mixes and litter for laboratory animals.** Bondy, R.; Burda, Z.; Hanis, T.; Pospisil, M.; Klir, P.; Svoboda, T.; Jelen, P.; Pribylova, M. (Ceskoslovenska Akademie Ved, Prague. Fyziologicky Ustav). 1985. (In Czech). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700732. (CONF-8411284—).

From Seminar on application of ionizing radiation in food and feeds processing; Prague, Czechoslovakia (1 Nov 1984).

The research was centred on feed mixes for laboratory rats and mice in conditions of germ-free and conventional breeding in isolators. Polyethylene was chosen as the most suitable packing material for radiation processing and subsequent storage. Pelleted diets and litter are packaged in three layers in 400 x 600 mm bags. 25

kGy for germ-free breeding and 50 kGy for gnotobiotic breeds of laboratory rats and mice were determined as being sufficient. The quality of processed diets and their effect on the weight and growth of rats is discussed. (Pu).

16848 (INIS-mf—10552, pp 24-27) **Detection of radiation processing in onions.** Duchacek, V. (Ustav pro Vyzkum, Vyrobu a Vyuziti Radioisotopu, Prague, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700732. (CONF-8411284—).

From Seminar on application of ionizing radiation in food and feeds processing; Prague, Czechoslovakia (1 Nov 1984).

Two breeds of onions were used for irradiation. Both breeds were divided into two parts - the first was irradiated with a dose of 80 Gy and the second served as a control. The two parts were stored under the same conditions. Conductometry, liquid chromatography and spectrophotometry were used for detecting the radiation processing of the onions. Only from the spectrophotometric determination of 2-desoxysaccharides it was possible to safely distinguish irradiated onions from non-irradiated controls throughout storage time. (E.S.).

16849 (INIS-mf—10552, pp 28-30) **Success and future potential of ionizing radiations in solving the food problem in the world.** Pesek, M.; Prasil, Z. (Ustav pro Vyzkum, Vyrobu a Vyuziti Radioisotopu, Prague, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700732. (CONF-8411284—).

From Seminar on application of ionizing radiation in food and feeds processing; Prague, Czechoslovakia (1 Nov 1984).

The article informs of the 3rd workshop on radiation effects which was held in Leipzig on September 24 to 28, 1984. Attention is mainly devoted to the industrial irradiation plant GBZ 81. The plant is used for the irradiation of onions to prevent germination. Onions are placed on a revolving annulus and transported between two /sup 60/Co sources where they are irradiated to a depth of 20 cm. The gamma radiation dose (20 to 70 Gy) is controlled using ampoules with Fricke's dosimetric solution. Other papers were centred on the results of irradiation of spices, pharmaceuticals, etc. (E.S.).

16850 (INIS-mf—10552, pp 31-33) **Will radiodisinfestation lead to a reduction in pesticide residues in food?.** Sedlackova, J.; Zuska, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez, Czechoslovakia; Vyzkumny Ustav Potravinarskeho Prumyslu, Prague, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700732. (CONF-8411284—).

From Seminar on application of ionizing radiation in food and feeds processing; Prague, Czechoslovakia (1 Nov 1984).

The article deals with the possibility of replacing pesticides with radiation disinfestation. The possibility is assessed of using / sup 60/Co, /sup 137/Cs sources or electron accelerators. The broad introduction of radiation disinfestation in practice is precluded by high capital and running costs of the equipment. The advantages are wholesomeness possibility of continuous treatment, reliability and speed of intervention. (E.S.).

16851 (INIS-mf—10552, pp 34-36) **Expanding the possibilities of food and feeds irradiation using UVVVR radiation sources.** Pesek, M.; Prasil, Z.; Rerichova, M.; Cervinsky, J.; Albrechtova, M. (Ustav pro Vyzkum, Vyrobu a Vyuziti Radioisotopu, Prague, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700732. (CONF-8411284—).

From Seminar on application of ionizing radiation in food and feeds processing; Prague, Czechoslovakia (1 Nov 1984).

The Perun and Radegast cobalt irradiation devices are described which have been installed at the Institute for the Research, Production and Use of Radioisotopes (UVVVR) in Prague. The Perun device consists of 21 vertically moving bars into which sources may be placed. Irradiated material is placed into revolving containers. The Radegast device is provided with a simple bar-shaped source. The dimensions of the irradiation chamber are 3x3 m for both sources. Both devices make possible continuous irradiation. The devices may be used for pilot plant irradiation and for irradiating feeds and foods in amounts of tons. (E.S.).

16852 (INIS-mf—10552, pp 9-11) **Proposal for imported fish meal radicidation.** Vacek, K.; Rejholec, J. (Ustav Jaderneho Vyzkumu CSKAE, Rez, Czechoslovakia; Statni Veterinarni Ustav, Terezin, Czechoslovakia). 1985. (In Czech). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700732. (CONF-8411284—).

From Seminar on application of ionizing radiation in food and feeds processing; Prague, Czechoslovakia (1 Nov 1984).

A brief evaluation is presented of the economic benefit and return of investments from a radicidation unit and storehouse for 25,000 tons of imported fish meal which accounts for 50% of current imports. Radicidation would be carried out with a dose of 4 kJ/kg using an electron accelerator at a cost of 18 Czechoslovak crowns per ton. The calculations made proved that capital return would be 1.5 years and economic benefit 6.12 crowns per one crown of expenditure. (J.P.).

16853 **Hyperfiltration of tomato juice: pilot plant scale high temperature testing.** Merlo, C.A.; Rose, W.W.; Pedersen, L.D.; White, E.M.; Nicholson, J.A. (National Food Processors Association, Berkeley, CA). *Journal of Food Science;* **51**: No. 2, 403-407(Mar-Apr 1986). Contract FC07-81ID12227.

A two-stage tubular hyperfiltration (reverse osmosis) pilot plant equipped with 15.6 m^2 of aromatic polyamide thin film composite membranes (ZF99) was studied with tomato juice (4-6% natural tomato soluble solids [NTSS]). It was operated over 100 hr in recirculation and single pass modes. The single pass mode was operated at 33-38 bar (feed inlet pressure) and 70-93°C for 18.2 hr. Stage 1 flux was 48 to 34 $Lm^{-2}hr^{-1}$. Stage 2 flux was 30 to 20 $Lm^{-2}hr^{-1}$. Concentration went to 7.4-9.0% NTSS at 8.6 L/min, and to 6.3-6.4% NTSS at 18.6 L/min. NTSS rejection was >98%. Of permeate samples tested none showed detectable levels of sugars; only 25% showed detectable levels of organic acids.

16854 **Hyperfiltration of tomato juice during long term high temperature testing.** Merlo, C.A.; Rose, W.W.; Pedersen, L.D.; White, E.M. (National Food Processors Association, Berkely, CA). *Journal of Food Science;* **51**: No. 2, 395-398(Mar-Apr 1986). Contract FC07-81ID12227.

A tubular hyperfiltration membrane system was studied with tomato juice in a recirculation mode. Two aromatic polyamide thin film composite membranes (ZF 99) (1.3 m^2) were examined. After 52 hr of operation with tomato juice one membrane exhibited a flux of 39.7 $Lm^{-2}hr^{-1}$ (72°C, 55.2 bar). Another membrane, after 717 hr, gave a flux of 41 $Lm^{-2}hr^{-1}$ (78°C, 41.4 bar) and natural tomato soluble solids (NTSS) rejection of 94 to >98%.

16855 **(CONF-861123—5) Long-term loss of radium in 63 subjects first exposed at ages 6 to 46.** Keane, A.T.; Schlenker, R.A. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004689.

From CEC/CEA international workshop on age-related factors in radionuclide metabolism and dosimetry; Angers, France (26 Nov 1986).

The absorbed dose to bone following the deposition of radium in the skeleton is principally determined by its long-term rate of clearance. In mice, rats, and dogs injected with alkaline-earth radionuclides at various ages between puberty and young adulthood, a negative correlation was observed between the age at injection and the skeletal uptake of the radionuclide and, at short times after injection, a positive correlation was observed between the age at injection and the fraction of the contemporary body content of the radionuclide excreted per unit of time, whereas at long times after injection the fractional clearance rate was found to be largely independent of the age at injection. Age-dependent models

of radium retention proposed for man conform to the metabolic observations in animals in their assumption that at long times after intake the fraction of the contemporary body content of radium excreted per unit of time is independent of the age at intake. In this paper, we investigate whether this assumption is supported by the data on the long-term retention of radium in radium-exposed persons.

16856 **(CONF-861123—6) Radium uptake in utero.** Schlenker, R.A.; Keane, A.T. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004711.

From CEC/CEA international workshop on age-related factors in radionuclide metabolism and dosimetry; Angers, France (26 Nov 1986).

A summary of information on a stillborn girl and her mother who had been a radium watch dial painter is provided. Although many dial painters bore children, this is the only example we have of simultaneous radioactivity determinations in mother and child prior to normal delivery. This case provides an opportunity to assess the degree of transfer of radium to the fetus in utero and may be unique in the study of the placental transfer of radium in humans. The mother (Case 00-009) worked at the US Radium Corporation, Orange, New Jersey, for 5 to 7 years beginning in 1918. She accumulated a substantial body burden of ^{226}Ra and ^{228}Ra by mouth tipping of brushes, as was then the custom in the American dial painting industry. Years later, her husband recalled that tissues inside her mouth glowed brightly in the dark and that the front of her clothing often glowed too; he described her as a rapid worker. The child (Case 01-579) was stillborn after a gestation period listed as six months on the certificate of stillbirth. The cause of death is listed as placenta previa. The mother died on the day of birth, February 24, 1928. She was 26 years old. Mother and daughter were buried in the same casket and exhumed together August 9, 1968. 12 refs., 3 tabs.

16857 **(CONF-861123—7) Age dependent retention of ^{212}Pb in the skeleton following ^{224}Ra uptake.** Schlenker, R.A. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004694.

From CEC/CEA international workshop on age-related factors in radionuclide metabolism and dosimetry; Angers, France (26 Nov 1986).

The purpose of this paper is to summarize unpublished analyses of the ^{212}Pb retention data and to provide numerical estimates of the variation of $^{212}Pb/^{224}Ra$ with age in humans. The principal conclusions are that skeletal $^{212}Pb/^{224}Ra$ increases with time after injection, increases with increasing body weight among species, increases with decreasing bone surface-to-volume ratio, and most likely increases with age in humans. These results will have practical implications to the dosimetry of ^{224}Ra and its daughter products in humans. In studies of cancer induction by the ^{224}Ra decay series, subjects have been as young as one year at injection, and a large fraction of the tumors have appeared in subjects exposed as juveniles. The chance that dosimetric data will become available from observations on humans is very small. Interspecies extrapolations such as the one summarized here will be necessary to adjust and refine dosimetry for humans. 13 refs., 6 tabs.

16858 **(JINR—E-19-85-202) Three methods to determine the yields of DNA double-strand breaks.** Erzgraeber, G.; Lapidus, I.L. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1985. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700787.

Submitted to the journal Int. J. Radiat. Biol. .

A possibility of determining the yield of DNA double-strand breaks in cells of the Chinese hamster (V79-4) by finding the amount of DNA released as a result of breaks and by determining the relative sedimentation velocity of DNA-membrane complexes affected by ionizing radiations with different physical characteristics is discussed. Results of the analysis are compared with the data obtained by a traditional method of sedimentation in the neutral sucrose density gradient. Comparative characterization of the methods is discussed. The yields of DNA double-strand breaks determined by the suggested independent methods are in good agreement, which opens possibilities of studying induction and repair of double-strand breaks by means of simpler and more reliable methods. 12 refs.; 4 figs.; 2 tabs.

16859 **(ORNL—6338) Animal mortality resulting from uniform exposures to photon radiations: Calculated LD_{50}s and a compilation of experimental data.** Jones, T.D.; Morris, M.D.; Wells, S.M.; Young, R.W. (Oak Ridge National Lab., TN (USA)). Dec 1986. Contract AC05-84OR21400. 119p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87005223.

Studies conducted during the 1950s and 1960s of radiation-induced mortality to diverse animal species under various exposure protocols were compiled into a mortality data base. Some 24 variables were extracted and recomputed from each of the published studies, which were collected from a variety of available sources, primarily journal articles. Two features of this compilation effort are (1) an attempt to give an estimate of the uniform dose received by the bone marrow in each treatment so that interspecies differences due to body size were minimized and (2) a recomputation of the LD_{50} where sufficient experimental data are available. Exposure rates varied in magnitude from about 10^{-2} to 10^{3} R/min. This report describes the data base, the sources of data, and the data-handling techniques; presents a bibliography of studies compiled; and tabulates data from each study. 103 refs., 44 tabs.

16860 **(PB—87-109773/XAB) Collaborative Radiological Health Laboratory annual report 1985: health effects of prenatal and postnatal whole-body exposure to ionizing radiation in the beagle dog.** (Colorado State Univ., Fort Collins (USA). Collaborative Radiological Health Lab.). Jul 1986. 82p. NTIS, PC A05/MF A01.

The Collaborative Radiological Health Laboratory was established in 1962 by the U.S. Public Health Service and Colorado State University for the purpose of determining in a carefully controlled animal experiment the life-time hazards associated with prenatal and early postnatal exposure to ionizing radiation. The CRHL study is designed to provide information that will facilitate the evaluation of risks to human beings from medical exposure during early development. This is a long-term (lifespan) study of a moderately large and long-lived mammal exposed at one of several times during development to a relatively small and discrete dose of external radiation. Ages-at-irradiation selected for comparison reflect the primary concern with medical exposures during the development period. The basic experiment under the contract contains 1,680 beagles that will be maintained and evaluated for most of their natural lives. Commitment of animals began in December 1967 and was completed in October 1972. The annual report summarizes the current status of the study for the reporting period of November 21, 1984 through November 20, 1985.

16861 **(PB—87-113031/XAB) Joint CDRH (Center for Devices and Radiological Health) and state quality-assurance surveys in nuclear medicine: Phase 2 - radiopharmaceuticals.** Hamilton, D.R.; Evans, C.D. (Food and Drug Administration, Rockville, MD (USA). Center for Devices and Radiological Health). Aug 1986. 52p. (HHS/PUB/FDA—86-8266). NTIS, PC A04/MF A01.

The report discusses survey results on aspects of the quality assurance of radio-pharmaceuticals from 180 nuclear-medicine facilities in the United States. Data were collected from facilities in 8 states. Demographic information about nuclear-medicine operations and quality-assurance programs was gathered by state radiation-control-program personnel. The data collected from the survey show an incomplete acceptance of quality-assurance practices for radiopharmaceuticals. Most of the facilities in the survey indicated that, because an inferior radiopharmaceutical was prepared so infrequently, they did not believe it was cost-effective to perform extensive quality-assurance testing. The Center for Devices and Radiological Health hopes that the information from the survey will stimulate nuclear-medicine professionals and their organizations to encourage appropriate testing of all radiopharmaceuticals.

16862 (PNL—5500-Pt.4, pp 30) **Positive ion irradiation facility.** Braby, L.A. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

MANY QUESTIONS ABOUT THE MECHANISMS OF THE RESPONSE OF CELLS TO IONIZING RADIATION CAN BEST BE INVESTIGATED USING MONOENERGETIC HEAVY CHARGED PARTICLE BEAMS. QUESTIONS OF THE ROLE OF DIFFERENT TYPES OF DAMAGE IN THE LET EFFECT, FOR EXAMPLE, ARE BEING ANSWERED BY COMPARING REPAIR KINETICS FOR DAMAGE INDUCED BY ELECTRONS WITH THAT PRODUCED BY HELIUM IONS. HOWEVER, AS THE MODELS BECOME MORE SOPHISTICATED, THE DIFFERENCES BETWEEN MODELS CAN BE DETECTED ONLY WITH MORE PRECISE MEASUREMENTS, OR BY COMBINING HIGH- AND LOW-LET IRRADIATIONS IN SPLIT-DOSE EXPERIMENTS. THE DESIGN OF THE AUTHORS PRESENT CELL IRRADIATION BEAM LINE HAS LIMITED THE AUTHORS TO IRRADIATING CELLS IN A PARTIAL VACUUM. A NEW WAY TO MOUNT THE DISHES AND BRING THE BEAM TO THE CELLS WAS REQUIRED. SEVERAL MEANS OF IRRADIATING CELLS IN MYLAR-BOTTOM DISHES HAVE BEEN USED AT OTHER LABORATORIES. FOR EXAMPLE AT THE RARAF FACILITY, THE DUAL ION EXPERIMENTS ARE DONE WITH THE DISH BOTTOM SERVING AS THE BEAM EXIT WINDOW BUT THE CELLS ARE IN A PARTIAL VACUUM TO PREVENT BREAKING THE WINDOW. THESE RESEARCHERS HAVE CHOSEN INSTEAD TO USE THE DISH BOTTOM AS THE BEAM WINDOW AND TO IRRADIATE THE ENTIRE DISH IN A SINGLE EXPOSURE. A SPECIAL, VERY FAST PUMPING SYSTEM WILL BE INSTALLED AT THE END OF THE BEAM LINE. THIS SYSTEM WILL MAKE IT POSSIBLE TO IRRADIATE CELLS WITHIN TWO MINUTES OF INSTALLING THEM IN THE IRRADIATION CHAMBER. IN THIS WAY, THE INTERACTION OF ELECTRON AND ION-INDUCED DAMAGE IN CHLAMYDOMONAS CAN BE STUDIED WITH TIME BETWEEN DOSES AS SHORT AS 5 MINUTES.

16863 (PNL—5500-Pt.4, pp 31) **Beta-particle dosimetry.** Roesch, W.C. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The National Council on Radiation Protection chose the members for its Scientific Committee #80, Radiobiology of the Skin. The committee met on April 24-25, 1984, to establish its program. First rough drafts of a report on radiobiology of the skin dealt with one of the principal problems the committee faces, i.e., properly averaging the dose in different parts of the skin.

16864 (PNL—5500-Pt.4, pp 33-34) **Linear energy transfer (LET) effects on repair rate.** Braby, L.A.; Nelson, J.M. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Studies of the repair rates for cells exposed to charged particles of different LET provide important information on the kinds of kinetic processes that should be considered in detailed mathematical models. In a preliminary study with Chlamydomonas reinhardi, the authors tentatively concluded that the repair rate was the same for 13 keV/μm proton and 81 keV/μm ^{3}He ion irradiation, thus suggesting that the same type of damage, repaired by the same process, was predominant in both cases. However, this conclusion was very tentative because of limited precision in the repair rate measurement. Two factors limited that precision: lack of temperature control and limited reliability of the accelerator ion source.

16865 (PNL—5500-Pt.4, pp 34-45) **Improving the precision and range of cell survival assays.** Braby, L.A.; Nelson, J.M.; Lien, M.K. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Most of the biophysical models that the authors would like to evaluate predict nearly equal survival except at very high surviving fractions. Thus, to test these models, survival data must be unusually precise. This requires determining the actual number of cells at risk, counting large numbers of clones, or both. As a part of their continuing program to improve the efficiency of their experiments, the author have automated the counting of clones in split-dose experiments.

16866 (PNL—5500-Pt.4, pp 37) **Dose-rate evidence for two kinds of radiation damage in stationary-phase mammalian cells.** Metting, N.F.; Braby, L.A.; Roesch, W.C.; Nelson, J.M. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Survival based on colony formation was measured for starved plateau-phase Chinese hamster ovary (CHO) cells exposed to 250 kV X-rays at dose rates of 0.0031, 0.025, 0.18, 0.31, and 1.00 Gy/min. A large dose-rate effect was demonstrated. Delayed-plating experiments and dose-response experiments following a conditioning dose, both using a dose rate of 1.00 Gy/min and delays of up to 48 h, were also used to investigate the alternative repair hypotheses.

16867 (PNL—5500-Pt.4, pp 37-39) **Sublethal damage is not the same as potentially lethal damage.** Nelson, J.M.; Metting, N.F.; Braby, L.A.; Roesch, W.C. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The Damage Accumulation Model assumes the existence of both single- and multiple-event damage, with exponential removal of the latter. This damage removal process corresponds to the repair of sublethal damage. Other investigators consider the shoulder on the survival curve, as well as related phenomena, to be a consequence of the same type of biochemical mechanism that leads to the delayed-plating effect, i.e., potentially lethal damage repair. The essential question is, therefore, whether or not the damage removal processes observed in different types of experiments. Survival data from split-dose experiments with starved plateau-phase CHO cells show two simultaneous damage removal processes.

16868 (PNL—5500-Pt.4, pp 41-42) **Survival of subpopulations of plateau-phase Chinese hamster ovary (CHO) cells selected by size.** Metting, N.F.; Braby, L.A.; Nelson, J.M.; Dickes, J.M.; D'Amico, A. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The radiation sensitivity of mammalian cells changes as a function of a cell's position in its replicative cycle, thus complicating the interpretation of experimental results. Results from studies using plateau-phase cell populations are more easily interpreted, since each cell can be considered to be stationary in the cell cycle. However, it has also been shown that even though ~85% of the cells are residing in G1 phase, the other phases are all represented. The authors use these starved, plateau-phase CHO cell populations in dose-rate, split-dose, and delayed-plating radiation response studies. Their work shows that two types of radiation damage repair are occurring simultaneously in this population, with repair half times of about one hour and twenty hours. It is possible that each repair rate reflects the same type of repair, but is manifested in different subpopulations at different rates. The authors investigated this question by irradiating a given population and then, using centrifugal elutriation, gently and aseptically separating it into subpopulations based on cell volume. Each fraction is then assayed independently for its clonogenic potential. To be certain that the sizing criteria reflect the expected stages of the cell cycle, flow cytometry is used to measure the DNA content of the cells in each fraction. Preliminary work has already been done to perfect the elutriation technique for the authors experimental design, using a Beckman's JE-6B elutriation system and rotor.

16869 (PNL—5500-Pt.4, pp 43-46) **Mechanism of mutagen-induced deoxynucleoside triphosphate imbalance in Chinese hamster ovary (CHO-K1) cells.** Newman, C.N. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

In previous reports, the authors demonstrated that exposure of Chinese hamster ovary cells (CHO-K1) to chemical carcinogen or radiation insults results in a transient deoxynucleoside triphosphate (dNTP) pool imbalance. Such an imbalance might be expected to affect the mutagenic response of cells to exposure by increasing the probability for base-misincorporation into de novo synthesized DNA and/or by exerting regulatory controls over the replicative response to exposure. Exposure to UV irradiation, a model mutagen, results in a rapid decrease (five- to ten-fold) in cellular dCTP and a concomitant increase (three- to sixfold) in dTTP, each observed within 10 minutes of exposure, and each persisting for several hours thereafter. However, the target and mechanism causing this response are not defined and, therefore, are presently the object of considerable study. A working hypothesis, now corroborated by data, is that radiation induces perturbations in selected enzyme activities which then perturb prevailing steady-state reaction equilibria, which, in turn, result in the imbalance the authors observe. Key enzyme activities were, therefore, examined in irradiated cells and compared to corresponding activities observed in unirradiated cells.

16870 (PNL—5500-Pt.4, pp 46-47) **Stochastic repair-misrepair model.** Miller, J.H. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The potential to quantitate both damage and mutation at the molecular level opens the possibility for stochastic simulation of mutation induction. The model described in this paper is based on the hypothesis that mutations induced by physical and chemical mutagens result from errors in DNA replication because of damage in the parental template. In bacteria it is meaningful to distinguish direct and indirect effects of DNA damage. Miscoding due to distortion in the DNA helix near a covalently bound adduct is an example of a direct effect. However, DNA damage may also induce responses (e.g., SOS repair) that involve mutator genes. At present, there is no evidence for an SOS-type response in mammalian cells. Nevertheless, mammalian cells do tolerate DNA damage and it is frequently speculated that the process by which the replication complex replitase) bypasses DNA damage is error-prone. In this model the consequences of replication on damaged templates are treated stochastically (i.e., by random variables). The probability distributions that govern the possible outcomes of damage-replitase interactions are the primary input to the model. This information is far from complete; however, formulation of the model will serve to focus on the data needs and perhaps will stimulate new experiments.

16871 (PNL—5500-Pt.4, pp 49-51) **Alpha-particle dose distribution effects at the cellular level.** Fisher, D.R.; Frazier, M.E.; Andrews, T.K. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Ionizing radiations that differ in number, size, and distribution of energy deposition events might be expected to cause different effects for the same absorbed dose. Furthermore, microdosimetry calculations suggest that large variations in biological effectiveness might be expected for internally deposited alpha-emitting radionuclides for the same absorbed dose, depending upon the specific activity and spatial distribution of the sources in tissue. The study described in this article was designed to demonstrate these phenomena in vitro. Cultured Chinese hamster ovary (CHO-K1 BH4) cells were exposed in vitro to inert, insoluble ceramic microspheres in zirconium dioxide labeled with ^{239}Pu. The average exit energy of the 5.15 MeV alpha particle was calculated to be 4.3 MeV. Exposure times varied from four to seven hours to achieve the desired dose level.

16872 (PNL—5500-Pt.4, pp 52) **Implementation of microdosimetry codes on mini-computers.** Hadley, R.T.; Wilson, W.E.; Fisher, D.R. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Computer programs (codes) are required to perform the complex mathematics of internal microdosimetry. Specific energy distributions for internally deposited alpha-emitting radionuclides can be calculated with these codes. The original internal microdosimetry computer codes were designed primarily for evaluation of theoretical formulations. They were written by W. C. Roesch for a large mainframe computer with input variables entered by punched cards. Since then, the codes have continuously updated and revised to meet changing needs and adapted to more modern computer systems. During the past year, the code MICRO was implemented on a supermini-computer system. MICRO calculated probability densities in specific energy for various geometrical configurations of sources (radioactivity) and sites (biological targets) in unit-density media. Implementation of MICRO involved upgrading a previous FORTRAN code. A newer FORTRAN code, LUNG, was also completed during the past year.

16873 (PNL—5750-Pt.5, pp 9-17) **Health physics support and assistance to the Department of Energy.** Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

Pacific Northwest Laboratory functions as the lead laboratory providing health physics support and assistance to the Division of Operational and Environmental Safety, Department of Energy (DOE), on special studies principally associated with the analysis of impact of standards, regulations, and engineering and administrative actions on occupational and environmental exposure. Support and assistance are also provided for other specific tasks or special studies identified by DOE as priorities. The designation of lead laboratory in health physics, with an agreement and budget in place, provides the Division with the additional expertise necessary to respond to the many questions and situations that arise during the operation of their numerous nuclear energy research, development, and demonstration facilities.

16874 (PNL—5750-Pt.5, pp 19) **Technical guidelines for radiological calibrations.** McDonald, J.C.; Roberson, P.L.; Swinth, K.L. Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

This program continues to provide technical guidelines for personnel dosimetry calibration procedures at Department of Energy laboratories. This information and guidance will help to optimize equipment and procedures for radiological calibrations. The current tasks include developing a performance data base for radiation protection instruments and preparing guidelines for their calibration. In addition, an intercomparison program for laboratory calibrations is under way.

16875 (PNL—5750-Pt.5, pp 21-23) **Personnel neutron dosimeter evaluation and upgrade program.** Faust, L.G.; Hadlock, D.E.; Brackenbush, L.W.; Parkhurst, M.A.; McDonald, J.C.; Scherpelz, R.I.; Haggard, D.L.; Cummings, F.M.; Endres, G.W.R.; Reece, W.D.; Roberson, P.L. Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

A program was initiated during FY 1981 with Pacific Northwest Laboratory as the lead laboratory to (1) evaluate response characteristics of personnel neutron dosimeter systems in current use at several DOE laboratories; (2) develop improved personnel neutron dosimeters, dosimetry systems, and portable instruments; (3) provide technical coordination of work being conducted by various laboratories, universities, and private companies in support of the development efforts; and (4) advance general state-of-the-art of overall neutron dosimetry field.

16876 (PNL—5750-Pt.5, pp 25-26) **Beta measurement evaluation and upgrade.** Swinth, K.L.; Rathbun, L.A.; Roberson, P.L.; Endres, G.W.R. Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

This program focuses on the resolution of problems associated with the field measurement of the beta dose component at Department of Energy (DOE) facilities. The change in DOE programs, including increased efforts in improved waste management and decontamination and decommissioning (D & D) of facilities, coupled with beta measurement problems identified at Three Mile Island has increased the need to improve beta measurements. In FY 1982, work was initiated to provide a continuing effort to identify problems associated with beta dose assessment at DOE facilities. The problems identified resulted in the development of this program. The investigation includes (1) an assessment of measurement systems now in use, (2) development of improved calibration systems and procedures, (3) application of innovative beta dosimetry concepts, (4) investigation of new instruments or concepts for monitoring and spectroscopy, and (5) development of recommendations to assure an adequate beta measurement program within DOE facilities.

16877 (PNL—5750-Pt.5, pp 27-28) **Department of Energy Laboratory Accreditation program for occupational exposure measurements.** Roberson, P.L.; Cummings, F.M.; Fox, R.A.; Hooker, C.D. Feb 1986. NTIS, PC A04/MF A01. File Number DE86011909.

In Pacific Northwest Laboratory annual report for 1985 to the DOE Office of the Assistant Secretary for Environment, Safety and Health. Part 5. Overview and assessment.

This program provides research support for the Department of Energy Laboratory Accreditation Program (DOELAP) for personnel dosimetry services. The research effort encompasses development of improved accreditation methods and operation of intercomparison and measurement assurance programs for DOE laboratories. Major accomplishments for FY 1985 included an upgrade in performance of dosimetry measurements to help improve beta-source standardization criteria, preparation of a source intercomparison capability for beta particles, quality assurance procedures and hardware, and the updating of documents required for the operation of the performance testing laboratory used in the accreditation process.

16878 (PNL-SA—14209) **Placental transfer of the actinides and related heavy elements.** Sikov, M.R. (Pacific Northwest Lab., Richland, WA (USA)). Nov 1986. Contract AC06-76RL01830. 13p. (CONF-861123—3). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004465.

From CEC/CEA international workshop on age-related factors in radionuclide metabolism and dosimetry; Angers, France (26 Nov 1986).

A selective literature review dealing with prenatal exposure of animals and humans to actinides and related heavy elements, comparative aspects of placental transfer and fetoplacental distribution are considered. General patterns have been derived from typical quantitative values, and used to compare similarities and dissimilarities, and to examine factors responsible for observed differences. 37 refs., 2 tabs.

16879 (UCRL—95082) **Personnel neutron dosimetry using CR-39 foils.** Hankins, D.E.; Homann, S.; Westermark, J. (Lawrence Livermore National Lab., CA (USA)). 13 Jan 1987. Contract W-7405-ENG-48. 11p. (CONF-870335—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004355.

From International conference on radiation dosimetry and safety; Taipei, China (2 Mar 1987).

We are using CR-39 foils for personnel nuetron dosimetry at the Lawrence Livermore National Laboratory. We have developed a three-step electrochemical etching procedure that includes low-frequency electrochemical etching at low frequency and at elevated temperatures. Our first etching step is at 60 Hz, 3000 V for 5 hours in a 60°C oven using 6.5 N KOH. The second etching step consists of an additional 23-minute etch at 60°C, 2.0 kHz, and 3000 V, which increases the track size and makes them relatively uniform in size. The final step is a 15-minute post etch at 60°C, which gives the tracks a smoother appearance. The foils are etched in etch chambers that can etch up to 24 foils. Several of these chambers can be used simultaneously with a single power supply. These chambers are rugged and have been used daily for over a year. 8 refs., 6 figs., 1 tab.

16880 **Neptunium-237 inhalation in rats.** Sullivan, M.F.; Ruemmler, P.S.; Buschbom, R.L. (Pacific Northwest Lab., Richland, WA). *Health Physics;* No. 6, 745-753(Dec 1986).

Groups of rats were exposed to aerosols of ^{237}Np nitrate to determine clearance rates, retention and distribution at various intervals after inhalation. Initial lung burdens (ILB) after ^{237}Np inhalation by three treatment groups were 0.12, 0.19 and 0.37 mu Ci/kg, respectively. Radiochemical analyses of animals killed at 4, 8, 14, 28 and 90 d, as well as data for others maintained until they became moribund, showed that their lung clearance followed a three-compartment model, clearance half-times for which were 1, 35, and 10,000 d, respectively. Only 3% of the ILB was retained after 90 d; 12% of that burden had translocated to the skeleton at 750 d; the half-time for skeletal retention was 2500 d. A single tumor was the only malignancy detected in the lungs of the 35 animals allowed to survive the early phase of the study.

16881 **Deposition and early disposition of inhaled $^{233}UO_2(NO_3)_2$ and $^{232}UO_2(NO_3)_2$ in the rat.** Ballou, J.E.; Gies, R.A.; Case, A.C.; Haggard, D.L.; Buschbom, R.L.; Ryan, J.L. (Pacific Northwest Lab., Richland, WA). *Health Physics;* No. 6, 755-771(Dec 1986).

Little information exists on the metabolism and potential health effects of ^{233}U and ^{232}U, high-specific-activity U isotopes associated with Th breeder systems. This paper describes the distribution and retention of the two isotopes following inhalation of uranyl nitrate, a simulated process solution. The lungs of rats exposed to $^{233}UO_2(NO_3)_2$ and $^{232}UO_2(NO_3)_2$ aerosols contained from 7 to 23% of the total amount of U retained in the rat after a 30-min inhalation exposure. Uranium was translocated rapidly from the lung and was retained mainly in skeleton, kidney and liver. Amounts equivalent to from one-quarter to one-half the initial lung burden (ILB) of U were excreted in urine the first day after inhalation. Radiation dose estimates based on ^{233}U and ^{232}U retention kinetics indicate that lung and skeleton would be the target organs for delayed radiation effects.

16882 **Quantitation of radiation-, chemical-, or enzyme-induced single strand breaks in nonradioactive DNA by alkaline gel electrophoresis: application to pyrimidine dimers.** Freeman, S.E.; Blackett, A.D.; Monteleone, D.C.; Setlow, R.B.; Sutherland, B.M.; Sutherland, J.C. (Brookhaven National Lab., Upton, NY). *Analytical Biochemistry;* 158: No. 1, 119-129(Oct 1986).

The authors have developed an alkaline agarose gel method for quantitating single strand breaks in nanogram quantities of nonradioactive DNA. After electrophoresis together with molecular length standards, the DNA is neutralized, stained with ethidium bromide, photographed, and the density profiles recorded with a computer controller scanner. The medium lengths, number average molecular lengths, and length average molecular lengths of the DNAs can be computed by using the mobilities of the molecular length standards. The frequency of single strand breaks can then be determined by comparison of the corresponding average molecular lengths of DNAs treated and not treated with single stand break-inducing agents (radiation, chemicals, or lesion-specific endonuclease). Single stand break yields (induced at pyrimidine dimer sites in uv-irradiated human fibroblasts DNA by the dimer-specific endonuclease from Micrococcus luteus) from our method agree with values obtained for the same DNAs from alkaline sucrose gradient analysis. The method has been used to determined pyrimidine dimer yields in DNA from biopsies of human skin irradiated in situ. It will be especially useful in determining the frequency of single strand breaks (or lesions convertible to single stand breaks by specific cleaving reagents or enzymes) in small quantities of DNA from cells or tissues not amendable to radioactive labeling.

5602 Thermal Effects

16883 **(BG-Trans—15029) Study of infra-red radiation characteristics: 2, Effect of infra-red radiation heating on the human body.** Yoshie, T.; Yagawa, N. (British Gas Corp., London; Tokyo Gas Research and Development Inst. (Japan)). 1986. Translated from 30th annual technical report of the Tokyo Gas Research and Development Institute, pp 133-142. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87900509.

When assessing heating by infra-red (ir) radiation, the absorption characteristics of the object being heated and its ir radiation transmittivity are important factors. We examined the ir radiation absorption characteristics of human skin and of clothing, and studied the effect of their heating by ir radiation. A non-steady unidimensional heat transfer model was used to examine the effect of the infiltration of ir radiation and of heating on the human body. 7 refs., 18 figs.

16884 **(BNL—38969) Studies of aluminum in rat brain.** Lipman, J.J.; Brill, A.B.; Som, P.; Jones, K.W.; Colowick, S.; Cholewa, M. (Vanderbilt Univ., Nashville, TN (USA). School of Medicine; Brookhaven National Lab., Upton, NY (USA); Institute of Nuclear Physics, Krakow (Poland)). 1985. Contract AC02-76CH00016. 19p. (CONF-8505112—9). NTIS, PC A02/MF A01; GPO Dep. File Number DE87005261.

From 2. international symposium on the biology and toxicology of metals using nuclear analytical methods; Upton, NY, USA (20 May 1985).

The effects of high aluminum concentrations in rat brains were studied using ^{14}C autoradiography to measure the uptake of ^{14}C 2-deoxy-D-glucose (^{14}C-2DG) and microbeam proton-induced x-ray emission (microPIXE) with a 20-μm resolution to measure concentrations of magnesium, aluminum, potassium, and calcium. The aluminum was introduced intracisternally in the form of aluminum tartrate (Al-T) while control animals were given sodium tartrate (Na-T). The ^{14}C was administered intravenously. The animals receiving Al-T developed seizure disorders and had pathological changes that included cerebral cortical atrophy. The results showed that there was a decreased uptake of ^{14}C-2DG in cortical regions in which increased aluminum levels were measured, i.e., there is a correlation between the aluminum in the rat brain and decreased brain glucose metabolism. A minimum detection limit of about 16 ppM (mass fraction) or 3 x 10^9 Al atoms was obtained for Al under the conditions employed. 14 refs., 4 figs., 1 tab.

16885 **(BNL—39169) In vivo determination of tibial lead by K x-ray fluorescence with a ^{109}Cd source.** Jones, K.W.; Schidlovsky, G.; Williams, F.H. Jr.; Wedeen, R.P.; Batuman, V. (Brookhaven National Lab., Upton, NY (USA); Veterans Administration Medical Center, East Orange, NJ (USA)). Dec 1986. Contract AC02-76CH00016. 25p. (CONF-8609203—4). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005254.

From International symposium on in-vivo body composition studies; Upton, NY, USA (28 Sep 1986).

We have demonstrated that absolute values of bone lead concentrations can be established from well-known physical constants. The correlation between EDTA test results and tibial lead measured by three different groups using three different methods is found, after normalization to common units, to lie on a common curve that, on average, shows the bone lead to be directly proportional to the EDTA results. It appears possible to improve the sensitivity and accuracy of the K x-ray determinations by improved data analysis programs and by increased source intensity and source-detector geometry changes. A present, the method appears capable of measuring lead concentrations at the 5-ppM (wet mass) level with uncertainties of +- 30 to 50% in 20 to 30 minutes measuring time. The uncertainties decrease at higher concentration levels. Measurements of the lead distribution in bone specimens by microscopic techniques would be useful in defining the relative merits of using K or L lead x rays in the measurements. 9 refs., 7 figs., 2 tabs.

16886 **(CONF-8509370—1) Incidence of fusiform rust infection on loblolly pine related to tip moth damage.** Powers, H.R. Jr.; Stone, D.M. (Forest Service, Athens, GA (USA). Southeastern Forest Experiment Station; Forest Service, Grand Rapids, MI (USA). North Central Forest Experiment Station). Sep 1985. Contract AI09-86SR15122. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003912.

From Joint conference of IUFRO working parties on forest gall midges and rusts of pines; Seoul, Korea (16 Sep 1985).

Nantucket pine tip moth (Rhyacionia frustrana) is a common pest over most of the natural range of loblolly pine, causing deformation and growth reduction of seedlings and saplings during the early life of the stand. Fusiform rust (caused by Cronartium quercuum f. sp. fusiforme) is a limiting factor in the production of southern pines throughout a broad area of the southeastern United States, extending from South Carolina to Texas. The target areas on the hosts for both pests are young, succulent shoot tissues. Carbofuran, a systematic insecticide, was used to determine the effect of controlling tip moth on seedlings infected by the fusiform rust organism. Beginning with the 2nd year carbofuran was applied over 4 successive years. The insecticide sharply reduced the incidence of tip moth and increased the height of 5-year-old saplings compared with untreated controls. Usually any treatment that stimulates the growth of pines also results in increased rust infection. However, this was not the case here because untreated saplings had significantly more infection. It is not known whether the increased disease incidence on untreated trees was due to the susceptibility and/or total number of secondary shoots initiated in response to tip dieback caused by the tip moth, or if carbofuran itself has some fungicidal effect resulting in lower infection on treated seedlings. 6 refs., 1 tab.

16887 (CONF-8606161—, pp 9-12) **Separations and synthesis support of pharmacokinetic studies.** Griest, W.H.; Ho, C.H.; Ma, C.Y.; Fleming, G.S.; Guerin, M.R. (Oak Ridge National Lab., TN). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract AC05-84OR21400.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

The research direction taken by ORNL in the OHER Complex Chemical Mixtures Program relies upon radiolabeled and unlabeled model compounds and well-characterized complex mixtures. Current research supported by the separations and synthesis activities of this project includes pharmacokinetic studies in skin and tracheal epithelium. Characterization of bioavailability, uptake, distribution, and metabolism are being conducted. To increase the discrimination of the measurements, a growing emphasis is being placed on the development of improved separations methods, ultimately for the isolation and determination of individual metabolites and also DNA adducts. This paper describes progress in these areas in the past year.

16888 (CONF-8606161—, pp 13-15) **Toxicokinetics of model compounds.** Witschi, H.P.; Smith, L.H. (Oak Ridge National Lab., TN). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract AC05-84OR21400.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Experiments were performed to test the pharmacokinetic behavior of model compounds. To date, results are available with three model compounds: mercuric chloride, benzo(a)pyrene and azabenzo(a)pyrene, where a substituted N at the 10 position prevents the formation of epoxides. Mercuric chloride was chosen as an example of a potential inorganic environmental contaminant; the other two are model polycyclic hydrocarbons. Known amounts of the isotopically labeled marker compounds mixed with 50 μl of the complex mixtures were applied to the shaved skin of male BALB/c mice. The animals were placed in metabolism cages and urine and feces were collected separately over a 24 hour period. Organs were prepared for liquid scintillation counting (^3H-labelled compounds)

or counted directly in a well-type scintillation counter (^{203}Hg). Results were calculated as percentages of applied dose.

16889 (CONF-8606161—, pp 21-22) **Metabolism of chemical mixtures by the upper respiratory tract.** Dahl, A.R.; Bond, J.A.; Brooks, A.L. (Lovelace Inhalation Toxicology Research Institute, Albuquerque, NM). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract AC04-76EV01013.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

The major hypothesis being tested is that the respiratory tract, including the nasal region, contributes substantially to the metabolism of inhaled organic compounds. If a substantial portion of an inhaled compound is metabolized in the respiratory tract and the metabolites are either more or less toxic than the parent compound, important toxicological effects could follow. Evidence produced to date that affirms this hypothesis includes: (1) Nasal tissue has been demonstrated to contain high concentrations of xenobiotic metabolizing enzymes. (2) Nasal tissue S-9 homogenate has been demonstrated to have substantial capacity to activate promutagens to mutagens. In fact, for rats, only nasal tissue S-9 was capable of activating some nitrosamines that cause rat nasal cancer indicating that nasal enzymes are important in determining the toxic action of these compounds. (3). In experiments to test nasal tissue xenobiotic metabolic activity in vivo, organic compounds instilled into the nasal cavities of hamsters, dogs and monkeys were metabolized. Toxic metabolites that then appeared in the mucus might be linked to cancer of the nose and alimentary tract. That nasal metabolic activity is important in determining the fate and toxicity of certain inhaled materials is supported by data at hand.

16890 (CONF-8606161—, pp 23-24) **Metabolism of chemical mixtures by the lower respiratory tract.** Bond, J.A.; Dahl, A.R.; McClellan, R.O.; Sabourin, P.J.; Sun, J.D. (Lovelace Inhalation Toxicology Research Institute, Albuquerque, NM). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract AC04-76EV01013.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Recent toxicokinetic studies have demonstrated that following inhalation, polycyclic aromatic hydrocarbons and their metabolites are rapidly absorbed from the respiratory tract and widely distributed to all tissues. The rapid absorption of these chemicals from the respiratory tract suggests that the different chemical functional groups represented by the chemicals investigated do not significantly alter the rates of pulmonary absorption of the inhaled chemicals. The data from these studies also indicate that the respiratory tract may in fact be playing a very important role in influencing the disposition of the inhaled chemicals. The research on toxicokinetics of different polycyclic aromatic hydrocarbons has provided important information on the biological fate of inhaled chemicals and has provided the necessary base for formulating and developing hypotheses to better understand the role of the lung in contributing to the metabolic fate of organic chemicals. Studies are under way which are designed to test the hypothesis that site-specific toxicity can be due to the capacity of different portions of the respiratory tract to metabolize inhaled chemicals to intermediates which can react locally with critical cellular macromolecules. The results from these experiments have supported the hypothesis that several portions of the respiratory tract have xenobiotic-metabolizing enzymes which are capable of converting organic chemicals to reactive intermediates.

16891 (CONF-8606161—, pp 31-32) **Uptake and fate of xenobiotics in plants.** Cataldo, D.A.; Bean, R.M.; Fellows, R.J. (Pacific Northwest Lab., Richland, WA). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Over the past two years, pathways research at PNL has focused on developing a basic understanding of the chemical and metabolic constraints affecting transport of complex organic mixtures from soil to plant to animal. The approach focuses on evaluating chemical and biochemical processes that influence the bioavailability, accumulation, and subsequent metabolic transformation of these materials in plants and soils as well as potential re-release to the environmental through respiration/volatilization. Differences have been observed in the fates of the individual components of complex mixtures to date. In hydroponically grown soybeans, aniline, an aromatic amine, was accumulated with approximately 90% of this being chemically transformed of which ~ 20% was respired and the remainder predominantly localized within the roots of the plant. Phenols, a natural component of plant secondary metabolism, were very rapidly accumulated by the plant and were also transformed (> 90%) with a larger amount of this lost through respiration (~ 35%). The material was also evenly distributed through the plant and was not volatilized from the leaves. Quinoline appeared to accumulation in the leaves with subsequent release from the plant through foliar volatilization. In a hydroponic situation, the indole is rapidly taken up by the plant with the major sites of accumulation being in the roots. In a soil-plant system, the indole is quickly bound to the soil (> 70% in less than 48 h) but is however available to the plants grown in the soil.

16892 (CONF-8606161—, pp 33-35) **Biological markers of environmental contaminants: analysis of P450 activities and adduct formation in aquatic and terrestrial species exposed to benzo(a)pyrene.** Shugart, L.; McCarthy, J.; Jimenez, B. (Oak Ridge National Lab., TN). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

The authors believe that the problems associated with uncertainties surrounding cellular pharmocokinetics of chemicals can be circumvented to a large extent by allowing the organism to act as the integrator of the unknown parameters of exposure and metabolism and measure the covalent interaction of chemicals which occur with cellular macromolecules. Analysis of DNA and hemoglobin obtained from bluegill sunfish (Lepomis macrochirus) exposed to BaP under laboratory conditions show: (a) the presence of adducts in these macromolecules. This demonstrates that the bluegill sunfish is similar to other organisms in that it possesses cellular enzymes capable of metabolizing BaP to the ultimate carcinogenic form of the chemical; (b) the amount of adduct formation depended upon the temperatures at which the fish were maintained, the difference in adduct formation with both DNA and Hb at the two temperatures is quantitatively similar; (c) BaP adduct formation with fish DNA is like that reported for other organisms; (d) BaP adduct formation with fish Hb is not similar to that reported for mice. Measured concentrations of BaP in soil and vegetation at a contaminated field site were coupled with blood analyses for BaP metabolites in muskrat (Ondatra zibethica) and shrews (Blarina brevicauda) to provide data on possible routes of transfer.

16893 (CONF-8606161—, pp 49-52) **Responses of the respiratory tract to inhaled particle-organic mixtures.** Mauderly, J.L.; Barr, E.B.; Bice, D.E.; Gillett, N.A.; Henderson, R.F.; Jones, R.K.; McClellan, R.O.; Pickrell, J.A.; Wolff, R.K. (Lovelace Inhalation Toxicology Research Institute, Albuquerque, NM). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract AC04-76EV01013.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

This project addresses mechanisms by which lung cancer and non-neoplastic lung disease are induced by inhaling complex mixtures containing respirable particles and particle-associated organics. Organics thought responsible for the increased lung cancer associated with cigarette smoke, urban atmospheres and occupational exposures are typically inhaled either adsorbed on particles or in close association with particles. The hypotheses driving the studies in this project are that (1) the health effects of inhaled organics are influenced by their association with particles, and (2) the health effects are influenced by the compositions of both the particles and the organics. The first hypothesis is based on the concept that association of organics with particles acts to prolong retention of the organics in the lung, resulting in a higher time-integrated dose of metabolites to target macromolecules and greater opportunity for initiation of cancer than would occur for organics without the particles. The second hypothesis is based on the concept that, not only do organic species have different carcinogenic potentials, but particle species also have different potentials for causing inflam-

matory and proliferative responses which act to promote carcinogenesis.

16894 (CONF-8606161—, pp 53-55) **Factors affecting the carcinogenicity of inhaled particle-organic mixtures.** Wolff, R.K.; Sun, J.D.; Mitchell, C.E.; Bond, J.A.; Barr, E.B.; Rothenburg, S.J.; Mauderly, J.L. (Lovelace Inhalation Toxicology Research Institute, Albuquerque, NM). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract AC04-76EV01013.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

An attempt is made to investigate the release of polycyclic aromatic hydrocarbons (PAH) in the lungs following inhalation of particles with adsorbed PAH and the consequences this has for binding of reactive metabolites to cellular macromolecules. DNA adducts are of particular interest because current concepts in chemical carcinogenesis suggest that their formation is an important step in the initiation process. The approach is to use inhalation exposures to single PAH and well-defined particles. The specific hypotheses that are being tested are: (1) A single inhalation exposure to PAH adsorbed on particles will result in slower release of organic compounds, more persistent levels of covalently bound material and greater time-integrated covalent binding of organic compounds, per unit of inhaled PAH, than inhalation of pure compounds. (2) Repeated exposures to inhaled PAH will result in a buildup of DNA adducts to greater time-integrated levels when PAH are adsorbed on particles than when inhaled as pure compounds. (3) Long-term inhalation exposures to PAH-CB will result in greater lung tumor incidence than exposures to pure PAH, correlated with DNA adduct levels. Carbon black particles were selected as carrier particles.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

In the past year, three major lines of investigation were followed as part of the complex mixtures program. In the first of these investigations, the uptake and metabolism of the carcinogen, benzo(a)pyrene [B(a)p], by the flow-through tracheal implant (FTTI) is being determined as the first step in studying the alteration of B(a)p utilization and metabolism when it is present in simple and complex mixtures. In the second line of investigation, the acute and subchronic responses of FTTI to two agents, B(a)p and formaldehyde (HCHO), are being determined as the first step in studying the combined action of agents in eliciting tumorigenesis in the respiratory systems. In the third series of studies, the acute and subchronic responses of FTTI to complex mixtures from fuel oils are being investigated as the first step to determining the tumorigenicity of these complex mixtures in the respiratory system. Their findings in these three lines of investigation are presented.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Research studies have related the carcinogenic potential of certain organic compounds with the ability of their metabolites to form chemical bonds with deoxyribunucleic acid (DNA). This relationship suggests that analysis of DNA for bound metabolites can provide an estimate of individual exposure to carcinogens. Methods evolved for determining total DNA binding cannot identify the bound organic compounds, because of the very low concentrations involved. Their recent work has shown that a combination of derivatization and gas chromatography/mass spectrometry can detect benzo[a]pyrene adduct residues at concentrations on the order of 0.1 picomoles per milligram DNA with good specificity. The method involves release of the hydrocarbon residue from the DNA by acid hydrolysis, formation of the methyl, acetyl, or trifluoracetyl derivative, and capillary gas chromatography with single ion mass spectrometer detection. 16 references.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

Although the molecular mechanisms of chemical carcinogenesis are not fully understood, it is generally thought that one mechanism involves the interaction of chemicals with deoxyribonucleic acid (DNA). There are many modifying factors that affect the fate and interaction of chemicals with DNA One such factor is the level and specificity of the enzymes that are involved in the metabolism of chemicals. Another modifying factor is the simultaneous exposure to more than one compound, where the parent compounds and their electrophilic metabolites compete for the available macromolecular sites. Therefore, prior and simultaneous exposure to chemicals are of practical relevance. The hypotheses that were tested in these studies were (1) that the levels of mixed function oxidases (MFO) are increased in the lung following administration of single compounds or mixtures of compounds, (2) that these increased MFO levels metabolize chemicals to electrophilic forms that bind to cellular DNA, and (3) that chemicals can compete at intracellular macromolecular sites which can be observed by their binding to DNA.

16898 (CONF-8606161—, pp 93-98) **Human lymphocyte mutagenicity assay.** Albertini, R.J.; McGinniss, M.J.; Nicklas, J.A.; O'Neill, J.P. (Univ. of Vermont, Burlington). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821.

The frequency of 6-thioguanine resistance (TG/sup r/) T-lymphocytes in human blood is one measure of somatic gene mutations occurring in vivo. They currently have two methods for detecting and quantitating these rare cells. A simple autoradiographic assay is based on scoring for cells that are resistant to TG inhibition of first-round phytohaemagglutinin (PHA) stimulated DNA synthesis in vitro. Because it is rapid, relatively inexpensive, and has the potential for automation, this assay could be an important tool for human mutagenicity monitoring. Unfortunately, there is no easy method for establishing the mutational origin of TG/sup r/ cells identified in this way, and autoradiography may score for pseudoresistant cells unless special precautions are taken. A newer assay for the TG/sup r/ T-lymphocytes in human blood relies on their direct in vitro cloning in TG. This allows recovery of the in vivo derived variants for studies that now have shown unequivocally their mutational origin and, in many cases, have demonstrated the nature of the mutations at the molecular level. Cloning has become the standard method for quantifying the hypoxyanthine-guanine phosphoribosyl transferase (HPRT) mutants arising in vivo in humans. Their current studies involve both the cloning and the autoradiographic assay. Conditions for the former have been modified in order to optimize single cell cloning and mutant cell recovery. The autoradiographic assay too has been modified, and the results obtained with this assay are being compared with results obtained by clonal assay for hprt mutant T-lymphocytes in the same blood samples.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

The general goals of this project are to determine what short-term measurements best predict long-term genotoxic effects in animals exposed to multiple chemicals and to learn about the mechanisms of toxicologically significant interactions. They are initially addressing the goals by using binary mixtures of benzo[a]pyrene (BaP) and benz[a]anthracene (BaA) in cellular and cell-free systems

for which the potential number of interactions is minimized. They examined the effects of BaA on the mutagenic activity of BaP as measured in the Salmonella mutagenesis assay, using relatively low and high concentrations of liver microsomes isolated from Aroclor-treated rats. The also assays genotoxicity by measuring binding of [^{3}H-BaP] to calf thymus DNA in vitro. At both the lower and higher microsomal protein concentrations, BaA inhibited binding of [^{3}H-BaP] to calf thymus DNA. These results are in contrast to those obtained with the mutagenesis assay of genotoxicity, in which BaA had opposite effects at the low and high protein concentrations. They are also examining the genotoxicities of BaP/BaA mixtures in the Chinese hamster ovary cell CHO/hypoxanthine-guanosyl-phosphoribosyl-transferase (CHO/HGPRT) assay, with detection of 6-thioguanine resistance.

Studies involving the white-footed mouse, Peromyscus leucopus have been performed to evaluate the possible environmental and human health consequences of hazardous waste pollution. The mice were collected at a highly ranked U.S. EPA Superfund site in Camden County, New Jersey. Two principal conclusions can be made from this pilot study. First, the utilization of white-footed mice to detect hazardous levels of genotoxic/cytotoxic pollutants in the environment is feasible. Second, the presence of micronucleated polychromatic erythrocytes (PCEs) in the bone marrow suggests a very recent exposure to genotoxic substances and/or an accumulation of body burdens of such chemicals, while the decrease in bone marrow mitotic index and in %PCE in the peripheral blood suggest that the animals at the hazardous waste site are inhabiting a more toxic environment. 15 references, 2 tables.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

To understand the development of disease from inhalation of complex chemical mixtures, it is necessary to use both in vitro and whole animal systems. This project is designed to provide links between these two types of research. The project has three major goals. The first goal is to evaluate the mutagenic activity of complex mixtures and the interactions between different fractions in these mixtures. The second is to develop model cellular systems that help define the mechanisms of genotoxic damage and repair in the lung. The third goal is to understand the mechanisms involved in the induction of mutations and chromosome aberrations in mammalian cells. Research on the measurement and interactions of mutagens in complex mixtures is illustrated by reporting a study using diesel exhaust particle extracts. The extracts were fractionated into ten different chemical classes. Each of the fractions was tested for mutagenic activity in the Ames Salmonella mutation assay. Individual fractions were combined using different permutations. The total mixture was reconstituted and the mutagenic activity compared to the predicted level of activity. Mutagenic activity was additive indicating that the chemical fractionation did not alter the extracts and that there was little evidence of synergistic or antagonistic interaction. To help define the mechanisms involved in the induction of mutations, they have exposed CHO cells to radiation and mutagenic chemicals alone and in combination. In these studies, they have demonstrated that when cells were exposed to 500 rad of x-rays followed by either direct or indirect acting mutagens frequency was less than would be predicted by an additive model.

16902 (CONF-8606161—, pp 111-114) **Action of tumor initiators and promoters in the Syrian hamster embryo cell transformation assay.** Jones, C.A.; Huberman, E. (Argonne National Lab., IL). Aug 1986. NTIS, PC A06/MF A01. File Number DE86014821. Contract W-31-109-ENG-38;W-7405-ENG-26.

From Conference on health and environmental effects of complex chemical mixtures; Delavan, WI, USA (16 Jun 1986).

The Syrian hamster embryo (SHE) cell transformation assay is unique among the rodent fibroblast transformation systems in that it uses normal, diploid cells. The have collaborated with two independent laboratories under a program sponsored by the National Toxicology Program to evaluate the SHE assay for screening carcinogens. Using coded chemicals, they observed a variable degree of intra- and interlaboratory reproducibility with the system. Overall, there was a good qualitative correlation between the carcinogenicity of the chemicals and their ability to induce morphological cell transformation. Unfortunately, the low level of response and lack of good dose-response relationships with certain chemicals are still major constraints to the use of this system in routine testing. Further consideration needs to be given to developing procedures that select for, or amplify, expression of the transformed phenotype. When SHE cells are treated for three days with a chemical initiator/carcinogen, e.g., benzo(a)pyrene, followed by treatment for four days with a tumor-promoting agent, e.g., phorbol 12-myristate 13-acetate (PMA), the frequency of morphological transformation is significantly enhanced compared to that in cultures treated with the carcinogen alone. Thus, the SHE assay might be useful for the investigation of potential tumor promoters.

16903 (NP—7751304) **Investigations in the toxic effect of H ions and Al ions on seedlings of spruce (Picea abies, KARST.) and beech (Fagus sylvatica, L.) in a solution culture.** Rost-Siebert, K. (Goettingen Univ. (Germany, F.R.). Forschungszentrum Waldoekosysteme - Waldsterben). 1985. 227p. (In German). NTIS (US Sales Only), PC A11/MF A01. File Number DE87751304.

The hypothesis on forest-dying by Ulrich, which constitutes an ecosystem approach, assumes the continued deposition of air pollutants to lead inter alia to the occurrence of 'acid toxicity' in the area of the roots of forest trees. Acid toxicity is considered a pre-disposing stress factor which damages the roots, causes nutrient deficiency, and plays an essential part in current forest disease in conjunction with accompanying and triggering stress factors. This investigation was aimed to invalidate the part of the hypothesis relating to Al toxicity. The experiments were carried through in culture solutions at continuous solvent flow under controlled external conditions using seedlings of the tree species spruce (Picea abies KARST.) and beech (Fagus silvatica L.) of identified seed origin. As potentially toxic Al ions are dissolved at pH values which, according to literature, are damaging to roots in themselves, both highly acid (-Al)-, and (+Al)-culture solutions were used. That is to say, the investigation covered acid toxicity in two forms, characterized by specific ions. Furthermore, as both the action of H/sup +/ and Al ions depends in part on the concentration of Ca/sup 2+/, the Ca/sup 2+/ concentration was introduced as an additional variable. The laboratory experiments were completed by a seeding test in the field following different soil treatments. The results are discussed in connection with investigations by other authors on H/sup +/ and Al toxicity in tree species, and a mechanism of Al toxicity is outlined which is based on the displacement and replacement of Ca/sup 2+/ by Al ions in the apoplast and at the plasmalemma.

16904 (NP—7770060) **Influence of water running down the stem of trees on the chemical soil characteristics and low vegetation in populations of old beech-trees in different forest stands.** Jochheim, H. (Goettingen Univ. (Germany, F.R.). Forschungszentrum Waldoekosysteme - Waldsterben; Kassel Univ. (Gesamthochschule) (Germany, F.R.). Fachbereich 19 - Biologie, Chemie). 1985. 236p. (In German). NTIS (US Sales Only), MF A01. File Number DE87770060.

This investigation aims to give a numeric description of the type and intensity of the chemical modifications of soil from water running down the stem of trees in the area of the roots of old

beech-trees, and to describe the related transformation of the low-growth vegetation. The crucial element in the investigation is the verification of the assumption of 'islands of soil chemistry' having been formed in the immediate vicinity of the stem of old beech trees which do not represent 'normal site conditions' but possess the characteristics of the next more acid buffer range, and that the combinations of plant species produced on such soils, too, display corresponding alterations. For this work 10 stands of old beech-trees of the medium-altitude mountains of northern Hessen were chosen; three of these were Lathyro-Fagetum populations, three Melico-Fagetum populations, and four Luzulo-Fagetum populations. The investigation thus covers the three beech-forest ecosystems predominant in central Europe. In each forest stand, 10 areas at the foot of trees (special sites) and 10 adjacent sites of comparison (ordinary sites) were studied as to their soil chemistry; 20 special and ordinary sites each were studied as to their vegetation. The inventory of the chemical soil conditions and the composition of plant species was carried through as single-time evaluation. The results obtained corroborate the assumption that there are, in all forest populations, significant differences between the areas at the foot of trees and sites of comparison, both as regards soil chemistry and vegetation.

16905 **(VW-FMT—8409V/5) Aldehyde toxicity and load of immissions from motor vehicles.** Kraft, J.; Kuhler, M. (Volkswagenwerk A.G., Wolfsburg (Germany, F.R.). Abt. Forschung und Entwicklung). 15 Nov 1984. 23p. (In German). NTIS (US Sales Only), PC A02/MF A01. File Number DE87751301.

The topical public discussion of the subject formaldehyde often is highly emotional and one-sided. To provide a factual basis for statements and discussions, this work tries to distil from the existing literature the current state of scientific knowledge on the action of aldehydes on man and animals. Thus, nothing has so far been reported world-wide to permit the conclusion that formaldehyde causes cancer or has mutagenic or teratogenic effects on man in the concentrations tolerated by man on account of it stinging smell. Neither do the existing epidemiological studies provide any clues to an increased total tumor rate or to an increase of individual tumor rates in persons exposed to formaldehyde. Furthermore, nose cancer diagnosed in rats after inhalation experiments as discussed in the press does not, because of the extremely high formaldehyde concentrations used (14.3 ppm), permit inferences as to the possible effect of the distinctly lower formaldehyde load to which persons can be exposed at work (maximum concentration at work = 1 ppm) or inside buildings (0.1 ppm). In this study, propagation calculations were also carried through for an urban road with a high traffic throughput. This yielded immission concentrations which were distinctly lower than the limiting value recommended by the Federal Health Authority of 0.1 ppm formaldehyde for residential areas.

16906 **Effect of carbon dioxide on sorghum yield, root growth, and water use.** Chaudhuri, U.N.; Burnett, R.B.; Kirkham, M.B.; Kanemasu, E.T. (Kansas State Univ., Manhattan). *Agricultural and Forest Meteorology;* **37**: No. 2, 109-122(Jul 1986). Contract FG02-84ER60253.

The concentration of atmospheric carbon dioxide (CO_2) is rising. The effect of higher than ambient levels of CO_2 on plans grown in the sub-humid central Great Plains of the US has not been investigated. Therefore, an experiment was conducted at Manhattan, Kansas, to study the effect of elevated levels of CO_2 on grain sorghum [Sorghum bicolor (L.) Moench]. During the summer of 1984, the sorghum was grown in rhizotrons in which root and shoot growth could be monitored throughout the growth cycle. The tops of the plants were enclosed in plastic chambers, which contained one of four concentrations of CO_2:330 (ambient), 485, 660, and 795 $\mu l\ l^{-1}$. Enriched CO_2 delayed the boot, half bloom, and soft dough stages. Sorghum grown at elevated concentrations of CO_2 yielded more roots and shoots than plants grown with 330 $\mu l\ l^{-1}$. At all soil-profile depths, root numbers and weights were higher at elevated CO_2 than at ambient CO_2. However, water use per unit dry matter of leaf, stem, root, and grain was decreased 13, 30, 31 and 29%, respectively, in plants grown at 795 $\mu l\ l^{-1}$ CO_2 compared to plants at 330 $\mu l\ l^{-1}$ CO_2. Although elevated CO_2 levels increased the stomatal resistance and leaf temperature, an increase in leaf area indices resulted in a lower canopy resistance. 20 references, 8 figures, 6 tables.

16907 **Microlocalization of brain zinc in zinc-deficient rats.** Wallwork, J.C.; Cholewa, M.; Jones, K.W.; Hanson, A.L.; Slatkin, D.N. (Dept. of Agriculture, Boston, MA). *Federation Proceedings, Federation of American Societies for Experimental Biology;* **45**: No. 4, 1086(5 Mar 1986). (CONF-8604222—). Contract AC02-76CH00016.

From 70. annual meeting of the Federation of American Society for Experimental Biology; St. Louis, MO, USA (13 Apr 1986).

Abnormal behavior and impaired brain function have been attributed to zinc deficiency in experimental animals. The bulk measurement of zinc in various brain parts indicated that this element was highly conserved during zinc deficiency. In this study proton-induced x-ray fluorescence (PIXE) was used to measure and localize zinc in thin brain sections of growth in rats maintained on a zinc-deficient diet (<1 ppm zinc). The zinc-supplemented control animals were fed the same diet with 25 ppm zinc-supplemented water. After 30 days of this regimen the rats were perfused with 0.85% saline until the brains were cleared of blood. The brains were excised, rapidly frozen, and 30-μm thick sections were cut with a stainless steel microtome knife. These sections were backed with adhesive tape and placed in a 50-μm diameter, 2.5-MeV proton beam, and the characteristic K x-rays produced were measured with a Si (Li) x-ray detector. The average brain zinc concentration measured by microPIXE was similar to values obtained from bulk samples with plasma emission spectrometry. There appeared to be a slightly higher concentration of zinc in basal ganglia, cortex, and white matter of zinc-deficient rat as compared to zinc-supplemented controls. The overall brain zinc concentration appeared to be relatively unaffected by zinc deficiency.

16908 **Effects of atmospheric CO_2 enrichment on the growth and mineral nutrition of Quercus alba seedlings in nutrient-poor soil.** Norby, R.J.; O'Neill, E.G.; Luxmoore, R.J. (Oak Ridge National Lab., TN). *Plant Physiology;* **82**: 83-89(1986). Contract AC05-84OR21400.

One-year-old dormant white oak (Quercus alba L.) seedlings were planted in a nutrient-deficient forest soil and grown for 40 weeks in growth chambers at ambient (362 microliters per liter) or elevated (690 microliters per liter) levels of CO_2. Although all of the seedlings became severely N deficient, CO_2 enrichment enhanced growth by 85%, with the greatest enhancement in root systems. The growth enhancement did not increase the total water use per plant, so water-use efficiency was significantly greater in elevated CO_2. Total uptake of N, S, and B was not affected by CO_2, therefore, tissue concentrations of these nutrients were significantly lower in elevated CO_2. An increase in nutrient-use efficiency with respect to N was apparent in that a greater proportion of the limited N pool in the CO_2-enriched plants was in fine roots and leaves. The uptake of other nutrients increased with CO_2 concentration, and P and K uptake increased in proportion to growth. Increased uptake of P by plants in elevated CO_2 may have been a result of greater proliferation of fine roots and associated mycorrhizae and rhizosphere bacteria stimulating P mineralization. The results demonstrate that a growth response to CO_2 enrichment is possible in nutrient-limited systems, and that the mechanisms of response may include either increased nutrient supply or decreased physiological demand. 30 references, 2 figures, 4 tables.

16909 **Letter to the Editor.** Banerjee, S.; Howard, P.H.; Tullis, D.L. (Brookhaven National Lab., Upton, NY). *Environmental Science and Technology;* **19**: No. 4, 374(1985).

A letter to the editor is presented which discusses the interrelationship between toxicity and biodegradability for chlorophenols.

16910 **Effects of elevated CO_2 on plants. III. Flower, fruit and seed production and abortion.** Garbutt, K.; Bazzaz, F.A. (Univ. of Illinois, Urbana). *New Phytologist;* **98**: 433-446(1984).

Four populations of Phlox drummondii and one population each of Datura stramonium and Abutilon theophrasti were grown

in six growth chambers at 300, 600 and 900 μl l^{-1} CO_2, all other environmental variables remaining constant. Changes in timing and numbers of flowers produced were species- and population-dependent. In general, P. drummondii and D. stramonium flowered earlier under high CO_2 while A. theophrasti was not affected. Significantly population x CO_2 interactions were found for several flower production characters in P. drummondii, indicating differential response to elevated CO_2 levels even within a species. In D. stramonium, increased biomass in high CO_2 caused significantly larger fruits to be formed, but there was no significant increase in seed number. In A. theophrasti, individual seed weight increased with increasing CO_2, but total seed weight per plant remained constant. These results are discussed in relation to their possible implications to plant community structure, and the effects on higher trophic levels (e.g. pollinators and plant predators). Qualitative as well as quantitative changes in plants in response to high CO_2 must be studied with care to ensure correct predictions of the effects of the global rise in CO_2. 21 references, 7 figures, 2 tables.

16911 (PB—87-920999/XAB) FDA (Food and Drug Administration) compliance program guidance manual (FY 87). Section 4. Medical and radiological devices. (Food and Drug Administration, Rockville, MD (USA)). 1987. 636p. (FDA/OMO—87/10D). NTIS, PC A99.

Supersedes PB86-920999; Updates and basic manual available on subscription as PB87-920900.

The FDA Compliance Program Guidance Manual provides a system for issuing and filing program plans and instructions directed to Food and Drug Administration Field operations for project implementation. Section IV provides those chapters of the Compliance Program Guidance Manual which pertain to the areas of medical and radiological devices. Some of the areas of coverage include laser and sunlamp standards inspections, compliance testing of various radiation-emitting products such as television receivers and microwave ovens, emergency response planning and policy, premarket approval and device manufacturers inspections, device problem reporting, sterilization of devices, and consumer education programs on medical and radiological devices.

57 HEALTH AND SAFETY

16912 (CONF-8611117—2) Confidence in technologies: Interactions between publics and industries. Wolfe, A.K. (Oak Ridge National Lab., TN (USA)). 1986. Contract AC05-84OR21400. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005363.

From Annual meeting of the Society for Risk Analysis; Boston, MA, USA (9 Nov 1986).

Confidence in the safety of industrial or technological activities is examined in three communities hosting industrial facilities, as well as in a series of communities affected by low-flying jet aircraft. The case studies produced a number of findings which have significant implications for risk communication, including: (1) several audiences for risk communicators exist, even within a single community; (2) different risk messages may be appropriate; and (3) historical and continuing interactions between industries and communities affect the types of situations which escalate to crises as well as the types of risk messages which are appropriate and trusted within industrial communities.

16913 (CONF-8611117—3) An experiment in combining estimates of uncertainty. Tonn, B.; Goeltz, R. (Oak Ridge National Lab., TN (USA)). 1986. Contract AC05-84OR21400. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004279.

From Annual meeting of the Society for Risk Analysis; Boston, MA, USA (9 Nov 1986).

This research explores how subjects combine estimates of uncertainty. Four major computer programs written in Common Lisp asked the subjects questions about the likelihoods of single events and conjunctions of independent events. The results suggest that the subjects did not widely use the product rule, appeared to use a minimum rule, and varied the combining heuristic as the magnitude of the likelihoods varied. The results suggest that inaccurate risk perceptions and judgments may, in part, result from deficient reasoning about uncertainty. Future research should encompass dependent events and time and explore other methods of representing uncertainty.

16914 (EGG—10282-1122) Role of the Federal Radiological Monitoring and Assessment Center (FRMAC) following a radiological accident. Doyle, J.F. III. (EG and G Energy Measurements, Inc., Las Vegas, NV (USA)). 1986. Contract AC08-83NV10282. 3p. (CONF-8609147—8). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87002863.

From American Nuclear Society annual meeting; Bethesda, MD, USA (15 Sep 1986).

The Federal Radiological Emergency Response Plan (FRERP) calls for the Department of Energy to establish a Federal Radiological Monitoring and Assessment Center (FRMAC) immediately following a major radiological accident to coordinate all federal off-site monitoring efforts in support of the State and the Cognizant Federal Agency (CFA) for the facility or material involved in the accident. Some accidents are potentially very complex and may require hundreds of radiation specialists to ensure immediate protection of the public and workers in the area, and to identify priorities for the Environmental Protection Agency (EPA) long-term efforts once the immediate protective actions have been carried out. The FRMAC provides a working environment with today's high technology tools (i.e., communication, computers, management procedures, etc.) to assure that the State and CFA decision makers have the best possible information in a timely manner on which to act. The FRMAC planners also recognize an underlying responsibility to continuously document such operations in order to provide the State, the CFA, and the EPA the technical information they will require for long term assessments. In addition, it is fully recognized that information collected and actions taken by the FRMAC will be subjected to the same scrutiny as other parts of the accident and the overall response.

16915 (UCRL—53757) Powered air-purifying respirator study: Final report. da Roza, R.A.; Cadena-Fix, C.A.; Kramer, J.E. (Lawrence Livermore National Lab., CA (USA)). Jul 1986. Contract W-7405-ENG-48. 33p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005579.

Three brands of powered air-purifying respirators were subjected to a simulated-work-place study. They were worn by six human subjects while working at 80% of their cardiac reserve on a treadmill. The air flow into the respirator was controlled to match that of a respirator with a newly charged battery and with various stages of battery discharge and filter plugging. The simulation took place in a large quantitative fit test chamber containing PEG 400 aerosol. The penetration of aerosol into the breathing zone of the respirator, the pressure in it, and the air flow were monitored while the subject was warming up as well as during the 80% tests. The exercises recommended in ANSI Z88.2 for helmets were also used after the 80% tests were completed. The subjects were tested clean shaven, with three days' growth of stubble, and with a two-month beard growth. A striking result was that the aerosol penetration into the two-helmet respirators increased dramatically as the subjects work rate increased. On the other hand, penetration into the half mask did not change with work rate. The penetration increased as the air flow was decreased in all cases for the helmets and for beard and stubble cases for the half mask. However, for he tight-fitting half mask on a clean-shaven face, the average penetration stayed below 0.001 for all flows. 18 figs, 5 tabs.

16916 (UCRL—94676) Filter penetration measurements using the condensation nuclei counter and the aerosol photometer. Biermann, A.H.; Bergman, W. (Lawrence Livermore National Lab., CA (USA)). 15 Nov 1986. Contract W-7405-ENG-48. 9p. (CONF-8611121—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003239.

From Conference on chemical defense research; Aberdeen Proving Grounds, MD, USA (15 Nov 1986).

Measurements of respirator protection factors for aerosols can differ, depending on the analytical technique used for particle detection. We have conducted both theoretical and experimental comparisons of the responses of two aerosol instruments used to

assess respirator protection - the light-scattering photometer and condensation nuclei counter. Results of our experiments indicate that differences in penetration measurements of the two instruments can vary up to a factor of ten. These variations can be attributed to: the response function of the photometer, the filter penetration, and the distribution of the test aerosol - all of which depend on particle size. In general, test aerosols with larger standard deviations in size produce greater discrepancies. For sufficiently large penetrations due to leakage, however, the instruments report penetrations that approach the same value, regardless of the size distribution of the test aerosol. 19 refs., 5 figs.

16917 (INIS-mf—10556-Vol.2, pp 653-659) **Ice ages.** Duplessy, J.-C. (Centre National de la Recherche Scientifique, 91 - Gif-sur-Yvette, France. Centre des Faibles Radioactivites). 1984. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700738. (CONF-8408138—Vol.2).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The Earth's climate undergoes great changes in cycles of 10/sup 4/ to 10/sup 5/ years. Deep sea sediments contain proof of these changes. The critical parameter is the O/sup 18//O/sup 16/ isotope ratio. The astronomical theory is discussed of ice ages based on the changes in the shape of the Earth's orbit around the sun. Forecasts for the future are given - in the coming years the climate is expected to get warmer owing to increased CO/sub 2/ levels in the atmosphere, and then a long cooler period is expected to follow. (M.D.).

16918 **(LA—10859-MS) Fran Ridge horizontal coring summary report hole UE-25h No. 1, Yucca Mountain Area, Nye County, Nevada.** Norris, A.E.; Byers, F.M. Jr.; Merson, T.J. (Los Alamos National Lab., NM (USA)). Oct 1986. Contract W-7405-ENG-36. 80p. NTIS, PC A05/MF A01. File Number DE87004764.

Hole UE-25h No. 1 was core drilled during December 1982 and January 1983 within several degrees of due west, 400 ft horizontally into the southeast slope of Fran Ridge at an altitude of 3409 ft. The purpose of the hole was to obtain data pertinent for radionuclide transport studies in the Topopah Spring Member of the Paintbrush Tuff. This unit had been selected previously as the host rock for the potential underground nuclear waste repository at Yucca Mountain, adjacent to the southwestern part of the Nevada Test Site. The hole was core drilled first with air, then with air mist, and finally with air, soap, and water. Many problems were encountered, including sloughing of tuff into the uncased hole, vibration of the drill rods, high rates of bit wear, and lost circulation of drilling fluids. On the basis of experience gained in drilling this hole, ways to improve horizontal coring with air are suggested in this report. All of the recovered core, except those pieces that were wrapped and waxed, were examined for lithophysal content, for fractures, and for fracture-fill mineralization. The results of this examination are given in this report. Core recovery greater than 80% at between 209 and 388 ft permitted a fracture frequency analysis. The results are similar to the fracture frequencies observed in densely welded nonlithophysal tuff from holes USW GU-3 and USW G-4. The fractures in core from UE-25h No. 1 were found to be smooth and nonmineralized or coated with calcite, silica, or manganese oxide. Open fractures with caliche (porous, nonsparry calcite) were not observed beyond 83.5 ft, which corresponds to an overburden depth of 30 ft.

16919 **(LBL—22559) Coupled processes in single fractures, double fractures and fractured porous media.** Tsang, C.F. (Lawrence Berkeley Lab., CA (USA)). Dec 1986. Contract AC03-76SF00098. 20p. (CONF-861246—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004477.

From Workshop on numerical modeling for radioactive waste repositories; Madrid, Spain (10 Dec 1986).

The emplacement of a nuclear waste repository in a fractured porous medium provides a heat source of large dimensions over an extended period of time. It also creates a large cavity in the rock mass, changing significantly the stress field. Such major changes induce various coupled thermohydraulic, hydromechanic and hydrochemical transport processes in the environment around a nuclear waste repository. The present paper gives, first, a general overview of the coupled processes involving thermal, mechanical, hydrological and chemical effects. Then investigations of a number of specific coupled processes are described in the context of fluid flow and transport in a single fracture, two intersecting fractures and a fractured porous medium near a nuclear waste repository. The results are presented and discussed.

16920 **(PNL—6087) Evaluation and status report on HYDROCOIN at midway (HYDROCOIN: An international project for studying groundwater hydrology modelling strategies).** Cole, C.R. (Pacific Northwest Lab., Richland, WA (USA)). Dec 1986. Contract AC06-76RL01830. 92p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87005564.

The US Department of Energy (DOE) is participating in the international hydrologic code intercomparison (HYDROCOIN) project organized by the Swedish Nuclear Power Inspectorate (SKI) for the purpose of improving our knowledge about the influence of various strategies for ground-water flow modeling for the safety assessment of final repositories for nuclear waste. The HYDROCOIN project consists of three levels of effort: Level One is concerned with verifying the numerical accuracy of codes, Level Two is involved with validation of models using field experiments, and Level Three is concerned with sensitivity and uncertainty analysis. The need for the HYDROCOIN project emerged from an earlier international study for the intercomparison of computer codes for radionuclide transport (INTRACOIN). The HYDROCOIN project began in May 1984 with a group of fourteen organizations from eleven countries participating; currently twenty organizations are involved. Five teams from DOE's Office of Civilian Radioactive Waste Management (OCRWM) are participating in the HYDROCOIN project, and this document presents the results of a review of this participation and an analysis of the benefits of OCRWM participation in the first 2 years (i.e., through May 1986) of the 3-year HYDROCOIN project. Efforts on the seven Level One cases are nearly complete. Level Two problems have been formulated and are in final draft form, and Level Three problems have been identified and are in first draft form. This report details the motivation, need, and benefits from HYDROCOIN through a chronological synopsis of the project's progress to date, brief description and intercomparison of preliminary Level One results prepared by OCRWM participants, and discussion of OCRWM contributions and plans for HYDROCOIN Level Two and Three efforts.

16921 **(SAND—87-7001C) A modeling study of the Culebra dolomite.** Haug, A. (Sandia National Labs., Albuquerque, NM (USA); Intera Technologies, Inc., Austin, TX (USA)). 1987. Contract AC04-76DP00789. 27p. (CONF-870252—1). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005064.

From Solving ground water problems with models conference; Denver, CO, USA (10 Feb 1987).

A modeling study has been performed as part of the regional hydrologic characterization of the Waste Isolation Pilot Plant (WIPP) site in New Mexico. The study resulted in an estimation of the transmissivity distribution, the hydraulic potentials, the flow field, and the fluid densities in the Culebra Dolomite Member of the Rustler Formation at the WIPP site. The work performed consisted of modeling the hydrogeology in the Culebra using two different approaches: steady-state modeling of the best estimate of the undisturbed situation, and transient modeling of the hydrogeologic conditions resulting from excavating three shafts at the center of the WIPP site as well as from various well tests. The three-dimensional finite-difference code SWIFT II with variable fluid density formulation was employed. The size of the model area was 12.24 km x 11.70 km. The boundary conditions (prescribed pressures and fluid densities) were estimated using the hydraulic head and fluid density data obtained from 40 wells at the WIPP site. The initial spatial transmissivity distribution in the Culebra dolomite was estimated using kriging techniques. The steady-state model was cali-

brated against the observed formation pressures and fluid densities. The calibration parameters were the transmissivities and the boundary conditions. The transmissivities were modified during the calibration process using kriging techniques, thus maintaining the statistical properties of the observed transmissivity data. The calibrated steady-state model was used as initial conditions for simulating transient processes in the Culebra at the WIPP site. The examples presented include the shaft history beginning in 1981 and a long-term pumping test (denoted the H-3 multipad pumping test) conducted in 1985.

16922 **Structure and timing of the last deglaciation: oxygen-isotope evidence.** Mix, A.C.; Ruddiman, W.F. (Columbia Univ., Palisades, NY). *Quaternary Science Reviews;* 4: 59-108(1985). Contract AC02-79EV10097.

Foraminiferal oxygen-isotope data from 24 tropical Atlantic sediment cores, constrained by 77 ^{14}C dates, are stacked to form a composite record of isotopic Termination 1. This record indicates that most of the isotopic transition at the end of the last ice age occurred between 14 ka BP and 6 ka BP. Minor isotopic expression of deglaciation is permitted as early as 16 ka BP, but the most rapid rate of change occurred between 14 ka BP and 12 ka BP. Three steps of maximum change are present. Although they are close to the statistical limits of detection in the composite record, the clear presence of the steps in individual records suggests that they are real. They estimate their timing at 14-12 ka BP (termination 1-a), 10-9 ka BP (Termination 1-b), and 8-6 ka BP (Termination 1-c). Centering of the termination near 11 ka BP is consistent with the Milankovitch hypothesis that high summer insolation caused deglaciation. In detail, however, maximum rates of change prior to the 11 ka BP insolation extreme, and the inferred steps require additional mechanisms controlling the tempo of glacial-interglacial climate change. Steps equivalent to those in $\delta^{18}O$ have not been detected in ice-margin retreat data. Steps in the isotopic transition, if real, may record thinning of the ice sheets not accompanied by loss of area. Alternation between near-equilibrium and near-stagnant ice-sheet profiles during deglaciation is hypothesized, perhaps due to calving and unstable down-draw of the ice sheets followed by partial re-equilibration. Significant problems remain. The effects of temperature on the isotope record are only partially constrained. Presently available data allow only semi-quantitative intercalibration of ice volume, sea level, and isotopic estimates of glaciation.

16923 **(EGG-PHY—7223) Reactivity analyses of Schlumberger samples.** Harker, Y.D.; Napper, P.R.; Roybal, G.S.; Scott, D.L. (EG and G Idaho, Inc., Idaho Falls (USA)). Apr 1986. Contract AC07-76ID01570. 20p. NTIS, PC A02/MF A01. File Number DE87004530.

The reactivity method has been used to measure the thermal absorption cross section on small samples (50cc or less). Through a cooperative program with SANDIA Laboratory (J.M. Harris, P.J. McDaniel, P. Lysne) this method has been demonstrated to have the ability to measure cross sections down to a few capture units (depending on sample size). The major thrust for this effort was in 1981-1982 which resulted in the determination of a set of sensitivity coefficients which relates the reactivity measurements taken in six positions of the Advanced Reactivity Measurement Facility (ARMF) to the thermal absorption cross section. Since this method does not require chemical or isotopic analyses of the contents it is a direct method for measuring the effective absorption cross section. The method has been used to analyze geological samples taken from oil exploration field activities and from laboratory calibration activities. The Schlumberger Well Services samples identified in this report are from the new calibration facility for Schlumberger located near Houston, Texas. 1 ref.

16924 **(BMI/ONWI—630) Preliminary rock mechanics laboratory: Investigation plan.** Oschman, K.P.; Hummeldorf, R.G.; Hume, H.R.; Karakouzian, M.; Vakili, J.E. (Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Jan 1987. Contract AC02-83CH10140. 98p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87005580.

This document presents the rationale for rock mechanics laboratory testing (including the supporting analysis and numerical modeling) planned for the site characterization of a nuclear waste repository in salt. This plan first identifies what information is required for regulatory and design purposes, and then presents the rationale for the testing that satisfies the required information needs. A preliminary estimate of the minimum sampling requirements for rock laboratory testing during site characterization is also presented. Periodic revision of this document is planned.

16925 **(BMI/ONWI—631) Laboratory investigation of crushed salt consolidation and fracture healing.** (IT Corp., Albuquerque, NM (USA); Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Jan 1987. Contract AC02-83CH10140. 202p. NTIS MF A01; 2; GPO Dep. File Number DE87005487.

A laboratory test program was conducted to investigate the consolidation behavior of crushed salt and fracture healing in natural and artificial salt. Crushed salt is proposed for use as backfill in a nuclear waste repository in salt. Artificial block salt is proposed for use in sealing a repository. Four consolidation tests were conducted in a hydrostatic pressure vessel at a maximum pressure of 2500 psi (17.2 MPa) and at room temperature. Three 1-month tests were conducted on salt obtained from the Waste Isolation Pilot Plant and one 2-month test was conducted on salt from Avery Island. Permeability was obtained using argon and either a steady-state or transient method. Initial porosities ranged from 0.26 to 0.36 and initial permeabilities from 2000 to 50,000 md. Final porosities and permeabilities ranged from 0.05 to 0.19 and from $<10^{-5}$ md to 110 md, respectively. The lowest final porosity (0.05) and permeability ($<10^{-5}$ md) were obtained in a 1-month test in which 2.3% moisture was added to the salt at the beginning of the test. The consolidation rate was much more rapid than in any of the dry salt tests. The fracture healing program included 20 permeability tests conducted on fractured and unfractured samples. The tests were conducted in a Hoek cell at hydrostatic pressures up to 3000 psi (20.6 MPa) with durations up to 8 days. For the natural rock salt tested, permeability was strongly dependent on confining pressure and time. The effect of confining pressure was much weaker in the artificial salt. In most cases the combined effects of time and pressure were to reduce the permeability of fractured samples to the same order of magnitude (or less) as the permeability measured prior to fracturing.

16926 **Experimental studies of elastic-wave propagation in a columnar-jointed rock mass.** King, M.S.; Myer, L.R.; Rezowalli, J.J. (Earth Science Div., Lawrence Berkeley Lab., Berkeley, CA). *Geophysical Prospecting;* 34: No. 8, 1185-1199(Dec 1986).

Results are presented of a series of cross-hole acoustic measurements made between four horizontal boreholes drilled from a near-surface underground opening situated in a basaltic rock mass. The objectives of the programs were to assess the extent of blast damage around the opening, and to evaluate the rock mass characteristics and their spatial variation around the opening. The acoustic velocity and attenuation data are indicative of an anisotropic, jointed rock mass, with a greater intensity of jointing along travel paths in the horizontal than the vertical direction. Low acoustic P- and S-velocities are indicative of blast damage and of zones of intense jointing or fracturing. In this case blast damage extends to approximately 1.5 m from the face. Attenuation data appear to be less sensitive in distinguishing between the blast-damaged zone and intense vertical jointing and fracturing in the virgin rock mass. Taken together with field data, laboratory measurements of P- and S-wave

velocities on intact core samples suggest that the rock mass is probably water saturated.

16927 **Direct measurement of the enthalpy of fusion of diopside.** Ziegler, D.; Navrotsky, A. (Princeton Univ., NJ). *Geochimica et Cosmochimica Acta;* **50**: No. 11, 2461-2466(Nov 1986). Contract FG02-85ER13437.

Crystalline diopside, $CaMgSi_2O_6$, was dropped directly into a Setaram HT1500 calorimeter operating at high temperature. At $1575 < T < 1624$ K, the heat content of the crystals was in excellent agreement with previously published results. Above 1634 K, a rise in the enthalpy was seen, supporting the incongruent melting reported by Kushiro. The total enthalpy of fusion at 1665 K, the nominal melting point, is 138.5 kJ/mol, in excellent agreement with measurements which used a cycle that involves dropping the liquid to form a glass and measuring heats of solution of glass and crystals. The heat content of a glassy diopside starting material was also measured. Because the calorimetric experiment lasts only about 8 minutes, these measurements could be extended into the supercooled liquid range (to 1170 K) before the onset of rapid crystallization. A change in slope in the measured heat contents gives a glass transition temperature of 9333 K, about 70 K lower than that reported by other methods. A linear fit of all the data above T/sub g/ (supercooled liquid at 970 to 1170 K, stable liquid at 1668 to 1766 K) gives an average heat capacity for the liquid of 332.8 J/mol/ x K, comparable to the value of 334.6 J/mol x K reported by Richet and Bottinga.

REFER ALSO TO CITATION(S) 15350, 16709, 16746, 16751, 16752, 16753, 16784, 16785, 16786, 16788, 16790, 16792

16928 **Dependence of albite dissolution kinetics on pH and time at 25°C and 70°C.** Knauss, K.G.; Wolery, T.J. (Lawrence Livermore National Lab., CA). *Geochimica et Cosmochimica Acta;* **50**: No. 11, 2481-2497(Nov 1986). Contract W-7405-ENG-48.

The dissolution rate of albite has been measured as a function of pH and time at 25°C and 70°C in a single-pass flow-through leaching apparatus. Run times extended to 50 days in each experiment. Limited data were obtained at 25°C in the pH range 4-10. More extensive data were obtained at 70°C over the pH range 1.39-11.75. Dissolution rates were defined by release of Si, and in some cases also by Al and Na releases. Speciation-solubility calculations indicate the solutions were well undersaturated for all the likely possible secondary minerals. The fluid was maintained far from equilibrium with albite in all runs. Analysis of the data shows a general consistency with the transition state theory model of Helgeson et al. Feldspars leached at low and high pH at 70°C showed extensive development of prismatic etch pits demonstrating a surface reaction-controlled dissolution process.

16929 **Arsenic distributions in porewaters and sediments of Puget Sound, Lake Washington, the Washington coast and Saanich Inlet, B.C.** Peterson, M.L.; Carpenter, R. (Univ. of Washington, Seattle). *Geochimica et Cosmochimica Acta;* **50**: No. 3, 353-369(Mar 1986). Contract AT06-71EV70024.

Solid phase As, Mn, Al, and excess ^{210}Pb and dissolved total As, As^{+3} As^{+5}, Mn^{+2}, Fe^{+2}, PO_4^{-3}, NH_4^+, and H_2S profiles in 12 cores from Puget Sound, Lake Washington, the Washington coast, and Saanich Inlet, B.C., are presented. Typically, strong correlations between solid phase As and Mn concentration maxima in surficial sediments are a result of intense As scavenging in the overlying waters by Mn or Fe-rich phases, or solid phase As dissolution at depth followed by upward diffusion and co-precipitation with Mn or Fe oxides at or near the sediment-water interface. Atypically, anthropogenic inputs cause high sedimentary As concentrations without accompanying high Mn levels. Sedimentary As fluxes are an order of magnitude greater in Puget Sound and Lake Washington than off the Washington coast and in Saanich Inlet. Porewater total As concentration profiles exhibit sub-surface maxima with magnitudes 10-60 times greater than in overlying bottom waters. Porewater maxima in marine environments are proportional to associated solid phase As concentrations. These maxima consistently occur within +/- 1.0 cm of the bottom of the ^{210}Pb-derived surface mixed layer, suggesting solid phase As release to porewater in response to a redox gradient across this mixing boundary. Dissolved As behavior beneath these maxima indicates As removal to solid phases in marine, but not lacustrine porewaters. Porewater As^{+3}/As^{+5} ratios are < 1.0 for Washington coastal environments and usually between 1.0-4.0 for Puget Sound and Lake Washington. As^{+5} is below the detection limit in porewaters of Saanich Inlet when the overlying bottom water is anoxic, but As^{+3}/As^{+5} ratios as low as 2.8 exist in near surface porewater under oxic bottom water conditions.

16930 **Identification of the physical and chemical characteristics of volcanic hazards.** Olsen, K.B.; Fruchter, J.S. (Battelle Pacific Northwest Labs., Richland, WA). *American Journal of Public Health, Supplement;* **76**: No. 3, 45-50(Mar 1986).

Immediately after the May 18, 1980 eruption of Mount St. Helens, the public health and laboratory science communities were required to assess the likely nature and toxicity of the volcanic products. This included assessing the following volcanic products: the emissions of volcanic gases (SO_2) and H_2S), volatile organics (polynuclear aromatic and halogenated hydrocarbons), toxic inorganics (arsenic, mercury, HF, and HCl), radon gas and short-lived radiation emitted (alpha and gamma) during the decay of radon daughters, and respirable particulates (fibrous materials and free crystalline silica). The intent of this article is to present the Mount St. Helens environmental sampling plan, discuss the numerous techniques available to the public health community to analyze volcanic emissions for toxic materials, and briefly outline the findings of the many analytical laboratory studies published after the 1980 eruption of Mount St. Helens.

16931 **Thermochemical study of the distribution of cobalt and nickel between diopsidic pyroxene and melt.** Wright, D.P.; Navrotsky, A. (Arizona State Univ., Tempe). *Geochimica et Cosmochimica Acta;* **49**: No. 11, 2385-2393(Nov 1985).

Glasses and crystals of compositions $MgCaSi_2O_6$, $CoCaSi_2O_6$ and $NiCaSi_2O_6$ were studied by high temperature solution calorimetry, x-ray diffraction, and pycnometry. These data were combined with trace element distribution data to obtain values for ΔG^0, ΔH^0, ΔS^0, and ΔV^0 for M-Mg exchange reactions. Enthalpies of vitrification increase in the order Co, Mg, Ni as do volumes of vitrification and apparent melting points. The mixing of Co and Mg, Ni and Mg, and Co and Ni is almost ideal in crystals and glasses, with small negative heats of mixing and small volume changes. The exchange reactions $MgCaSi_2O_6$ (xl) + $MCaSi_2O_6$ (liq) = $MgCaSi_2O_6$ (liq) + $MCaSi_2O_6$ (xl) are exothermic for Ni and endothermic for Co. The volumes and entropies of the exchange reaction are small.

16932 **Distributions of dissolved calcium and alkalinity in the Weddell Sea in winter.** Chen, C.T.A. (Oregon State Univ., Corvallis). *Antarctic Journal of the United States;* 136-137(1983).

In the late austral winter of 1981, from 9 October to 25 November, as part of the US-USSR Weddell Polynya Expedition the authors measured dissolved calcium and titration alkalinity (TA) in the Weddell Sea. Their values were the first winter data collected in the Weddell Sea and probably represent the initial calcium and TA concentrations of the deep Pacific waters. With this information they can now calculate more accurately the in situ calcium carbonate ($CaCO_3$) dissolution rate in the Pacific.

16933 (DOE/ER/60348—5) Continental shelf processes affecting the oceanography of the South Atlantic Bight: Progress report, June 1, 1986 to May 31, 1987. Atkinson, L.P. (Old Dominion Univ., Norfolk, VA (USA). Research Foundation). Jan 1987. Contract FG05-85ER60348. 52p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005303.

As part of a study of continental shelf processes affecting the oceanography of the South Atlantic Bight, data collected during the Spring 1985 SPREX field experiment was processed and analyzed. The goals of the analyses were to: (1) determine the distribution of temperature, salinity, nutrients, and humic fluorescence such that flow fields and distributions of variables could be related to wind forcing events; (2) determine the time change in nutrient concentration and salinity at selected current meter locations; and (3) evaluate the usefulness of tritium as a fresh water tracer in the nearshore region of the South Atlantic Bight. (ACR)

16934 (DOE/ER/60435—T2) Sediment transport characteristics of the nearshore zone between Hilton Head and Ossabaw Islands, Georgia as determined by heavy mineral analysis. Schmitter, R.D. (Georgia Univ., Athens (USA)). 1986. Contract FG09-86ER60435. 90p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87004385.

The objective was to understand sediment transport processes in the nearshore zone between Hilton Head and Ossabaw Islands along the coast of Georgia. The heavy mineral composition of the sediments was used to map the distribution of sediments from the Savannah and Ogeechee Rivers of Georgia, the Santee and Coosawatchie/Broad Rivers of South Carolina, and the adjacent continental shelf. 16935 (ATR—6(9558)-11) Contributions to the 18th International Cosmic Ray Conference. Blake, J.B.; Fennell, J.F.; Koga, R.; Katz, N.; Dearborn, D.S.P.; Margolis, S.H. (Aerospace Corp., El Segundo, CA (USA)). Mar 1986. 20p. NTIS, PC A02/MF A01.

Four papers presented at the 18th International Cosmic Ray Conference are compiled. Topic areas include: ultraheavy cosmic rays, secondary production of gamma rays in the Jovian magnetosphere, the stellar upper mass limit in an OB association, and a data processing unit for satellite- borne composition instrumentation.

16936 (ATR—6(9558)-11, pp vp) Ultraheavy cosmic rays: Propagation and selective acceleration. Margolis, S.H.; Blake, J.B. (Aerospace Corp., El Segundo, CA). Mar 1986. NTIS, PC A02/MF A01.

In Contributions to the 18th International Cosmic Ray Conference.

Results of calculations of ultraheavy cosmic ray propagation are examined in the light of recent observations and theoretical advances with the objective of distinguishing the effects of propagation from nucleosynthesis and preferential acceleration. The results presented here have been calculated by the method described in Margolis (1983), with elements from iron (Z = 26) to uranium (Z = 92) combined in a single calculation. The source abundances of Anders and Ebihara (1982) have been used as a reference composition. It is shown, in particular, that the relative abundances of Sr and Ba are substantially increased by using the modified ionization potential dependence (MIPD) compared with solar abundance and the first ionization potential dependence (FIPD) models. In contrast, Pb shows similar enhancements in both FIPD and MIPD models.

16937 (ATR—6(9558)-11, pp vp) Secondary production of gamma rays in the Jovian magnetosphere. Blake, J.B.; Margolis, S.H. (Washington Univ., St. Louis, MO). Mar 1986. NTIS, PC A02/MF A01.

In Contributions to the 18th International Cosmic Ray Conference.

Photons in the MeV and above energy range resulting from interactions of energetic protons and electrons in the Jovian magnetosphere with the Jovian satellite Amalthea are studied. The photon flux as a function of Jovian radii is found to be 0.2/sq R(J) per sq cm/sec, a relatively low value. If the magnetospheric configuration at Jupiter is similar to that of the Earth, a nearly radiation-free region may exist below the trapped particles, but sufficiently high for an observing satellite to orbit with a reasonable drag lifetime.

16938 (ATR—6(9558)-11, pp vp) Stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances. Blake, J.B.; Dearborn, D.S.P. (Arizona Univ., Tucson). Mar 1986. NTIS, PC A02/MF A01.

In Contributions to the 18th International Cosmic Ray Conference.

Some implications are considered of the possibility that the collapse of the solar nebula was induced by the supernova of an extremely massive star or, at least, such a star was in the vicinity of the protosolar nebula prior to its collapse to form the solar system. A very large star in the vicinity of the protosolar nebula can contribute to the protosolar nebula in several ways which differ from a smaller (but still large) star: (1) the high mass-loss rate of a very large star implies the dispersion into the nearby interstellar medium of many solar masses of freshly synthesized material (a substantial dilution can occur before its contribution is masked); (2) a significant amount of Al-26 is synthesized and dispersed well before the subsequent supernova; (3) energy is available in the stellar wind for accelerating cosmic rays in sufficient quantities to heavily irradiate nearby material; (4) the absence of freshly synthesized Pu-244 (no resetting of the plutonium clock) can be understood in a natural way; and (5) a significant amount of Pd-107 can be dispersed into the interstellar medium during a WC stage.

16939 (ATR—6(9558)-11, pp vp) Versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation. Blake, J.B.; Fennell, J.F.; Koga, R.; Katz, N. Mar 1986. NTIS, PC A02/MF A01.

In Contributions to the 18th International Cosmic Ray Conference.

A data processing unit (DPU) for use with a charge-composition experiment to be flown aboard the VIKING auroral research satellite is described. The design of this DPU is such that it can be readily adapted to a variety of cosmic-ray composition experiments.

16940 (CEA-CONF—8460) Heavy element compositions and energy spectra of galactic and solar cosmic rays. Engelmann, J.J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). Apr 1986. 22p. (In French). (CONF-8604273—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750446.

From International spring school on space environment technology; Toulouse, France (14 Apr 1986).

Two components are apparent in the proton and heavy nuclei cosmic ray records; the galactic component, solar modulated in accordance with the 11 years cycle, and the solar component, consisting of bursts of particles spread in interplanetary medium and occuring at random, but preferentially during the period of solar maximum. Comparison of observed abundances of galactic cosmic rays and local galactic matter provides information on the sources of cosmic rays and on their journey in the galaxy. As regards the solar proton events, the observed abundances vary from one event to the other. It is however possible to draw a basic composition, which, while different from local galactic and solar photospheric composition, is very similar to that observed in the solar corona and in the galactic cosmic rays. Solar events have been parametrized in order to allow an evaluation of their effects: there are typical spectra for the ordinary and anomalously large events, and there is a "mean case" and "worst case" composition of a typical event.

16941 (CONF-8607112—1) **Infrared absorption and emission characteristics of interstellar PAHs [Polycyclic Aromatic Hydrocarbon].** Allamandola, L.J.; Tielens, A.G.G.M.; Barker, J.R. (National Aeronautics and Space Administration, Moffett Field, CA (USA). Ames Research Center; Michigan Univ., Ann Arbor (USA). Dept. of Atmospheric and Oceanic Science). 1986. Contract FG02-85ER13442. 20p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87003375.

From Interstellar processes conference; Jackson, WY, USA (1 Jul 1986).

The mid-infrared interstellar emission spectrum with features at 3050, 1610, 1300, 1150, and 885 cm^{-1} (3.28, 6.2, 7.7, 8.7 and 11.3 microns) is discussed in terms of the Polycyclic Aromatic Hydrocarbon (PAH) hypothesis. This hypothesis is based on the suggestive, but inconclusive comparison between the interstellar emission spectrum with the infrared absorption and Raman spectra of a few PAHs. The fundamental vibrations of PAHs and PAH-like species which determine the ir and Raman properties are discussed. Interstellar ir band emission is due to relaxation from highly vibrationally excited PAHs which have been excited by ultraviolet photons. The excitation/emission process is described in general and the ir fluorescence from one PAH, chrysene, is traced in detail. Generally, there is sufficient energy to populate several vibrational levels in each mode. Molecular vibrational potentials are anharmonic and emission from these higher levels will fall at lower frequencies and produce weak features to the red of the stronger fundamentals. This process is also described and can account for some spectroscopic details of the interstellar emission spectra previously unexplained. Analysis of the interstellar spectrum shows that PAHs containing between 20 and 30 carbon atoms are responsible for the emission. 43 refs., 11 figs.

16942 (EFI—788(15)-85) **Ultra-high energy gamma-rays as the carriers of cosmological information.** Agaronyan, F.A.; Atoyan, A.M. (Erevanskij Fizicheskij Inst. (USSR)). 1985. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700680.

A possibility to verify a number of cosmological hypotheses by searching the cutoffs in spectra of ultra-high energy gamma-rays from extragalactic sources is discussed. 24 refs.; 4 figs.

16943 (INIS-mf—10556-Vol.1, pp 129-132) **Convection-driven dynamos.** Soward, A.M. (Newcastle upon Tyne Univ., UK. School of Mathematics). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

In addition to the buoyancy forces driving the convection, the Lorentz and Coriolis forces play a dominant role in determining the nature of fluid motion in the Earth's core. Two geodynamo models distinguished by the assumed strength of magnetic field are discussed. In the weak field model the Lorentz force can be neglected at the lowest order, while in the strong field model the Lorentz and Coriolis forces are assumed to be comparable at the very outset. Current theoretical effort in the field is critically reviewed. (J.U.).

16944 (INIS-mf—10556-Vol.1) **Trends in physics 1984. Proceedings of the 6th general conference of the European Physical Society. Volume 1.** Janta, J.; Pantoflicek, J. (eds.). (Jednota Ceskoslovenskych Matematiku a Fyziku, Prague). 1984. 306p. (CONF-8408138—Vol.1). NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737.

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Volume 1 of the conference proceedings contains plenary lectures and papers of sessions on non-linear plasma astrophysics, neutrino physics and astrophysics, hard hadron collisions, positron-electron collisions, and atomic and molecular physics. (J.P.).

16945 (INIS-mf—10556-Vol.1, pp 150-155) **Magnetic reconnection in astrophysics.** Schindler, K. (Bochum Univ., Germany, F.R. Inst. fuer Theoretische Physik). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Magnetic reconnection has been invoked to explain important transport phenomena and the activity of space and astrophysical plasmas. Two major classes of reconnection are generally distinguished. If time dependence is not essential, steady state reconnection schemes may be applicable. The time-dependent reconnection may either be predominantly spontaneous or predominantly driven. A few aspects that are essential in current research in this field are mentioned and the general trend in favour of the time-dependent reconnection is emphasized. The key role of in-situ space probe measurements is accounted for. A satisfactory theoretical understanding of reconnection requires a deeper insight into collective dissipation processes. (J.U.).

16946 (INIS-mf—10556-Vol.1, pp 156-161) **Particle acceleration by turbulent plasmas.** Benz, A.O. (Eidgenoessische Technische Hochschule, Zurich, Switzerland). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Acceleration processes in stellar atmospheres seem to be very common. In solar flares at least two acceleration mechanisms can be observed. All of them are complex electromagnetic phenomena. Relevant observations of the past maximum of solar activity are reviewed. Macroscopic views today favor magnetic reconnection as the primary energy release mechanism. They do not tell us, however, how magnetic energy is converted into kinetic energy of particles. Electron bremsstrahlung observed in hard X-rays suggests that a considerable part of the energy is first showing up in 30 to 100 keV electrons. Evidence is presented for stochastic acceleration of electrons and ions by plasma turbulence in this first phase of flares. Theoretical work on a acceleration of electrons and ions by resonance interaction with stochastic turbulence is progressing. The turbulence may form in the primary flare energy release, e.g., by unstable currents. The requirement of high efficiency suggests that the unstable waves play a central role in the energy conversion process. Lower-hybrid waves driven cross-field drifting ions (or currents) are proposed. The diffusion equation has been solved and the results compared with observations. Some of this turbulence may be converted to radio emission at decimeter wavelengths. The consequences for flare models and the interpretation of solar radio bursts are discussed.

16947 (INIS-mf—10556-Vol.1, pp 186-187) **Self-consistent models of solar photospheric magnetic flux concentrations.** Deinzer, W.; Hensler, G.; Schuessler, M.; Weisshaar, E. (Goettingen Univ., Germany, F.R.; Muenchen Univ., Germany, F.R.; Kiepenheuer-Institut fuer Sonnenphysik, Freiburg, Germany, F.R.; Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Goettingen, Germany, F.R.). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The structure was investigated of photospheric flux concentrations by numerical integration of the full nonlinear MHD equations. The results are summarized and a flux tube with a diameter of 500 km discussed in more detail.

16948 (INIS-mf—10556-Vol.1, pp 188-189) **Coronal heating by magnetic tearing turbulence.** Browning, P.K. (Saint Andrews Univ., UK). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The heating of solar corona by direct currents is investigated. The coronal field responds to slow photospheric motions by evolving through a series of equilibria which may be resistively unstable. The subsequent magnetic reconnection dissipates part of the magnetic energy. At evaluating the energy release the Taylor-Heuvaerts hypothesis is used. For a given footpoint motion the heating of an arcade is calculated. It is shown that linear velocity profiles

provide no heating, the energy transfer being more efficient in more strongly sheared arcades. (J.U.).

16949 (INIS-mf—10556-Vol.1, pp 192-193) **Magnetopause stability threshold for patchy reconnection.** Galeev, A.A.; Kuznetsova, M.M.; Zeleny, L.M. (AN SSSR, Moscow. Inst. Kosmicheskikh Issledovanij). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The magnetopause is considered as a transition layer in which the magnetic field vector rotates at a finite angle determined by the direction of the interplanetary magnetic field. The Vlasov kinetic approach is used to study the stability of magnetic surfaces within the layer. Magnetic surfaces can be destroyed by the growth and overlapping of magnetic islands, which can be considered to be a macroscopic but spatially localized magnetic field reconnection process. The thresholds and growth rates of such a reconnection are calculated. The preliminary results of theoretical consideration are discussed in relation with recent ISEE magnetopause measurements. (J.U.).

16950 (INIS-mf—10556-Vol.1, pp 16-24) **Compact galactic X-ray sources.** Paradijs van, J. (Amsterdam Univ., Netherlands). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Compact galactic X-ray sources are accreting compact objects in binary systems, accompanied by either a massive or low-mass star. A comparison of the observed properties of these massive and low-mass X-ray binaries, a short outline of their structural differences, and a summary of the constraints which can be put on neutron-star properties from X-ray observations of such systems are given.

16951 (INIS-mf—10556-Vol.1, pp 194-195) **Axisymmetric pulsar magnetosphere.** Mestel, L. (Sussex Univ., Brighton, UK. Astronomy Centre). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Progress towards the construction of a classical model of the pulsar magnetosphere is reported for the case where the angular velocity vector and the magnetic axis of the rigidly rotating neutron star are aligned. The trajectories of outstreaming electrons emanating with sub-relativistic speeds from each polar cap are calculated as well as the radiated power. Some particles at least return to the star with a high gamma value, thus pair production may be expected. (J.U.).

16952 (INIS-mf—10556-Vol.1, pp 199-211) **Aborigines of the nuclear desert.** Rujula, A. De. (European Organization for Nuclear Research, Geneva, Switzerland). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The chart of "stable nuclides" extends from hydrogen to Z — 98, A — 263. It contains another island of stability - neutron stars - in a narrow range around Z — 10/sup 56/, A — 10/sup 57/. In between lies a supposedly barren region encompassing more than 50 orders of magnitude. This desert may be populated by strange quark balls: stable single bags containing similar proportions of u, d and s quarks. These balls are candidates for the constituency of the "dark mass" in galaxies and in the Universe. Seven ways are described to search for these possible inhabitants of the nuclear desert.

16953 (INIS-mf—10556-Vol.1, pp 223-228) **Neutrino masses and galaxy formation.** Rees, M.J. (Cambridge Univ., UK. Inst. of Astronomy). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The issue of "hidden mass" is crucial to models of galaxy formation, and also to the question of whether the Universe can have the so called "critical density". If one species of (stable) neutrino had a mass of 10-100 eV, it could in principle provide such mass; however, the properties of galaxy clusters predicted by neutrino-dominated cosmogonic schemes may not be compatible with what is observed. The physical ideas involved in these schemes are outlined and compared with other ideas about what the "hidden mass" consists of.

16954 (INIS-mf—10556-Vol.1, pp 246) **Astrophysics and grand- and superunification.** Roncadelli, M. (Pavia Univ., Italy. Ist. di Fisica Nucleare). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

16955 (INIS-mf—10556-Vol.1, pp 247-256) **Thermodynamics of the Universe.** Marx, G. (Eoetvoes Lorand Tudomanyegyetem, Budapest, Hungary. Atomfizikai Tanszek). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Attention is focused on the initial period of the development of the Universe following the Big Bang. Questions are discussed related to the origins of matter, stars and galaxies, to the age of the Universe, to the time of its future existence, etc. (Z.J.).

16956 (INIS-mf—10556-Vol.1, pp 162-169) **Shock wave acceleration.** Voelk, H.J. (Max-Planck-Institut fuer Kernphysik, Heidelberg, Germany, F.R.). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Only an extremely efficient and ubiquitous mechanism might explain the energy sources and the power law spectrum of the galactic cosmic rays. The Fermi acceleration process associated with shock waves can meet such requirements. To illustrate this fact, particle acceleration in a diffuse shock is described in detail. The interaction of the interstellar high-energy particle component with a thermal gas is simple but strongly nonlinear. Some nonlinear aspects of the acceleration processes are treated in detail. Most effects described in the paper have been observed in interplanetary shocks. Moreover, the special process of shock acceleration might be able to replenish the high-energy particle component throughout the Universe. More detailed astronomical observations are needed to empirically check on this possibility. (J.U.).

16957 **(ITF—85-118-R) On the mass loss rate by the nuclei of planetary nebulae.** (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1985. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701325.

A type of dependence of the expansion velocity in planetary nebula (PN) on its radius that describes well the observed character of PN expansion is proposed. An analytical expression for mass loss rate by the nebula nucleus, that provides the observed expansion of nebula, is obtained in the model of fast and slow stellar winds. 14 refs.; 3 figs.

16958 **(ITF—86-29-R) UBVRI-photometry of the antiflare stars V586 Ori and IU Ori.** Koval'chuk, G.U. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1986. 24p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700760.

The results of photoelectric UBVRI-observations of the antiflare stars V586 Ori carried in 1979-1983 are presented. A random deep weakening up to 2/sup m/(V) are the main process of variability. The decrease of variable star brightness is interpreted under the assumption that a global weakening of brightness is due to the appearance in a close proximity to variable stars of the absorbing matter clouds. 57 refs.; 9 figs.

16959 (JINR—R-2-85-667, pp 19-28) **Parametric transformation of weak gravitational wave into electromagnetic one in a three-level system.** Tagirov, Eh.A. 1985. (In Russian). NTIS (US Sales Only), PC A08/MF A01. File Number DE87780075. (CONF-8506332—).

From Conference on the history of particle physics; Dubna, USSR (25 Jun 1985).

A model of resonance parametric transformation of a gravitational wave to electromagnetic one is considered. Two plane monochromatic waves: a strong electromagnetic and weak gravitational - interacting in a medium generate at difference and sum frequencies an electromagnetic wave in a direction determined with the condition of spatial wave synchronism. Rarefied cold gas or beam of elementary emitters ("molecules") serve as a medium model. Coefficients of parametric transformation have been determined.

16960 (KFKI—1986-23/C) **Icy-glue model of cometary nuclei.** Gombosi, T.I.; Houpis, H.L.F. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). May 1986. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700817.

Since 1950 a number of models have been proposed to explain the observations of comets. For the most part the icy conglomerate model of Whipple was the standard. Based on the recent images made by VEGA and GIOTTO spacecrafts of comet Halley, a model of the nucleus is suggested that retains the advantages of the icy conglomerate formalism on a local level, while a new global framework is introduced. The model is discussed in terms of the mounting knowledge of comets, the creation of the nucleus in the cosmogenic sence, and expectations of future analysis of data and observations are presented. A new methodology for calculating the evolution and thermal profiles of the nucleus is also presented. 41 refs.

16961 (KFKI—1986-32/B) **Monopole abundance from first order GUT phase transition of the early Universe.** Bagoly, Zs.; Lukacs, B.; Paal, G. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1986. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700818.

Monopole annihilation and pair production are investigated in a first order GUT symmetry breaking phase transition without inflation. It is found that even with complete initial monopole suppression, some monopoles are inevitably produced during the transition. Accordingly, some constraints are obtained for the initial and equilibrium monopole densities in order to be compatible with the present observational limit even without inflation. 21 refs.; 3 figs.

16962 (KFKI—1986-41/C) **Cosmic ray fluctuations at rigidities 4 to 180 GV.** Benko, G.; Erdoes, G.; Stehlik, M.; Katz, M.E.; Nosov, S.F. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1986. 11p. (CONF-8408212—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700821.

From 9. European cosmic ray symposium; Kosice, Czechoslovakia (20 Aug 1984).

The power spectral density of cosmic ray fluctuations observed at both underground and ground level during the years 1976-1980 was calculated. The spectral index is independent of the phase of solar cycle in the frequency range of 5 x 10/sup -7/ - 5 x 10/sup -5/ Hz and its value is equal to 2. The level of fluctuations shows a weak dependence on the rigidity (R) of the particles P—R/sup -2/3/. The obtained experimental results are in agreement with the theoretical predictions. 10 refs.; 4 figs.

16963 (LA-UR—86-3395) **Pulsations of white dwarf stars with thick hydrogen or helium surface layers.** Cox, A.N.; Starrfield, S.G.; Kidman, R.B.; Pesnell, W.D. (Los Alamos National Lab., NM (USA)). Jul 1986. Contract W-7405-ENG-36. 6p. (CONF-8607108—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87001954.

From IUA symposium no. 123; Aarhus, Denmark (7 Jul 1986).

In order to see if there could be agreement between results of stellar evolution theory and those of nonradial pulsation theory, calculations of white dwarf models have been made for hydrogen surface masses of 10^{-4} solar masses. Earlier results indicated that surface masses greater than 10^{-8} solar masses would not allow nonradial pulsations, even though all the driving and damping is in surface layers only 10^{-12} of the mass thick. It is shown that the surface mass of hydrogen in the pulsating white dwarfs (ZZ Ceti variables) can be any value as long as it is thick enough to contain the surface convection zone. 10 refs., 6 figs.

16964 (LA-UR—86-4115) **Nonlinear RR Lyrae models with time dependent convection.** Ostlie, D.A.; Cox, A.N. (Los Alamos National Lab., NM (USA); Weber State Coll., Ogden, UT (USA). Dept. of Physics). 11 Aug 1986. Contract W-7405-ENG-36. 5p. (CONF-8608130—9). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003721.

From Stellar pulsation conference; Los Alamos, NM, USA (11 Aug 1986).

Results of convective, nonlinear RR Lyrae models are presented. The standard mixing length theory has been used with time dependence being introduced through the convective velocity phase lag technique. Turbulent pressure and turbulent viscosity are also included. Results are compared with those of other time dependent convection theories. 9 refs., 2 figs.

16965 (LA-UR—86-4116) **Linear nonadiabatic pulsations of homogeneous ZAMS stars.** Cahn, J.H.; Cox, A.N.; Ostlie, D.A. (Los Alamos National Lab., NM (USA); Illinois Univ., Urbana (USA). Dept. of Astronomy; Weber State Coll., Ogden, UT (USA). Dept. of Physics). 11 Aug 1986. Contract W-7405-ENG-36. 5p. (CONF-8608130—10). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003722.

From Stellar pulsation conference; Los Alamos, NM, USA (11 Aug 1986).

Current uncertainty about the most massive observed stars has led to a reexamination of the most massive star that is stable against radial pulsation. The nuclear energy generation equations in the LNA linear, nonadiabatic code have been considerably improved, so that it is now appropriate to redo the study to determine the maximum mass of ZAMS star that will be stable against pulsation. 12 refs., 2 figs., 2 tabs.

16966 (LA-UR—86-4331) **Observations of heavy energetic ions for upstream from comet Halley.** Sanderson, T.R.; Wenzel, K.P.; Daly, P.W.; Cowley, S.W.H.; Hynds, R.J.; Richardson, I.G.; Smith, E.J.; Bame, S.J.; Zwickl, R.D. (Los Alamos National Lab., NM (USA); European Space Research and Technology Centre, Noordwijk (Netherlands); Max-Planck-Institut fuer Aeronomie, Katlenburg-Lindau (Germany, F.R.); Imperial Coll. of Science and Technology, London (UK); Jet Propulsion Lab., Pasadena, CA (USA)). 1986. Contract W-7405-ENG-36. 6p. (CONF-8610207—3). NTIS, PC A02. File Number DE87003752.

From 20. ESLAB symposium; Heidelberg, F.R. Germany (27 Oct 1986).

On March 25, 1986, the ICE spacecraft came within 28 x 10^3 km of the nucleus of comet Halley. For several days around this time, bursts of heavy ions were observed by the ICE energetic ion experiment. These bursts were observed only during periods when the solar wind velocity was considerably higher than its nominal value. We examine the characteristics of these ions, in particular their anisotropies. Using the well known formulae for transformation of distributions from the solar wind frame of reference to the spacecraft frame, we examine the angular distributions expected from either protons, or heavy ions from the water group, and show that the measurements are consistent with heavy ions, and not with protons. We discuss other sources of heavy ions and conclude that the most likely source of these ions is comet Halley. 9 refs., 5 figs.

16967 (LA-UR—87-38) **Steepened magnetosonic waves in the high β plasma surrounding Comet Giacobini-Zinner.** Tsurutani, B.T.; Smith, E.J.; Thorne, R.M.; Gosling, J.T.; Matsumoto, H. (Los Alamos National Lab., NM (USA); Jet Propulsion Lab., Pasadena, CA (USA); California Univ., Los Angeles (USA). Dept. of Atmospheric Sciences; Kyoto Univ. (Japan)). 1986. Contract W-7405-ENG-36. 6p. (CONF-8610207—8). NTIS MF A01; 2; GPO Dep. File Number DE87005123.

From 20. ESLAB symposium; Heidelberg, F.R. Germany (27 Oct 1986).

We extend the previous studies of intense hydromagnetic waves at Giacobini-Zinner to investigate the mode and direction of wave propagation. Simultaneous high-resolution measurements of electron density fluctuations demonstrate that the long period (~100 s) waves are propagating in the magnetosonic mode. Principal axis analyses of the long period waves and accompanying partial rotations show that the sum of the wave phase rotations is 360°C, indicating that both are parts of the same wave oscillation. From the time sequence of the steepened waveforms observed by ICE, we demonstrate that the waves must propagate towards the sun with C/sub ph/ < V/sub sw/. All available observations are consistent with wave generation by the resonant ion ring or ion beam instability which predicts right-hand polarized waves propagating in the ion beam (solar) direction. The large amplitudes Δ polarized B/absolute value of B~0(1) and small scale sizes (rotational discontinuities) of the cometary waves suggest that rapid pitch-angle scattering and energy transfer with energetic ions should occur. Since the waves are highly compressive, Δ absolute value of B/absolute value of B = 0(0.5), one can also anticipate first-order Fermi acceleration. 15 refs., 6 figs.

16968 (N—87-12406) **Variability studies of 3C 371. Final report, 1 April 1985-30 September 1986.** Worrall, D.M. (Smithsonian Astrophysical Observatory, Cambridge, MA (USA)). Oct 1986. 4p. (NASA-CR—179772; NAS—1.26:179772). NTIS, PC A02/MF A01.

The compact extragalactic radio source, 3C 371, was observed with the x-ray detectors of the EXOSAT satellite for 19.5 hours in 2 observing periods separated by 18 days. This resulted in the discovery of x-ray variability of the source on time scales between 8 hours and about 25 minutes and the confirmation of earlier reports of variability on longer time scales. The short time scale variability agrees remarkably well with earlier predictions based on fitting multifrequency data from the source to a relativistically beamed inhomogeneous synchrotron self-Compton (SSC) jet model. This SSC model is frequently applied to BL Lac objects and related sources, such as 3C 371. However, the number of free parameters in model fits tends to be large, and so independent support such as from this work is important. The x-ray spectral results for 3C 371 also may provide qualitative support for the SSC model in that the spectrum probably consists of two components, with the steeper one at low photon energies. In terms of the model, the low-energy spectrum would be dominated by synchrotron emission extending down to radio energies, whereas the higher energy x-rays would be dominated by Compton radiation.

16969 (N—87-12407) **Reports of planetary astronomy, 1985.** (National Aeronautics and Space Administration, Washington, DC (USA)). Sep 1986. 217p. (NASA-TM—89189; NAS—1.15:89189). NTIS, PC A10/MF A01.

This is a compilation of abstracts of reports from Principal Investigators funded through NASA's Planetary Astronomy Program, Office of Space Science and Applications. The purpose is to provide a document which succinctly summarizes work conducted in this program for 1985. Each report contains a brief statement on the strategy of investigation and lists significant accomplishments within the area of the author's funded grant or contract, plans for future work, and publications.

16970 (N—87-12407, pp vp) **Research in planetary astronomy.** Mccord, T.B. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The composition, structure and processes operating on the surfaces of solar system objects were determined using the Mauna Kea observing facilities and modern instrumentation. Reflectance spectroscopy and multispectral imaging in the 0.3 to 5.0 micrometers spectral region are the major techniques used. Major focus was in qualifying and using the new imaging spectrometer and the 2-D IR detectors for spectroscopy and imaging. The major observational program emphasis was on preparing for the next Mars opposition, and searching for compositional units in the lunar highlands.

16971 (N—87-12407, pp vp) **Advanced infrared astronomy.** Mumma, M.J.; Deming, D.; Espenak, F.; Kostiuk, T. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The CO_2 laser heterodyne spectrometer was used at the 3-m IRTF on Mauna Kea to make measurements of Mars during the 1984 opposition. Analysis of the observations of the mesospheric non-thermal emission demonstrated the existence of a warming of the Mars polar mesosphere, similar to the seasonal effects which are well known to occur at the Earth's mesopause. A search for CO_2 and NH_3 on Comet Halley was done with the new Kitt Peak system as well as with the IRTF heterodyne system. A Lamb-dip absorption cell was designed and constructed. Its use will allow extreme frequency stabilization of the laser local oscillator, which will greatly facilitate measurements of winds and dynamical phenomena. The Lamb-dip cell was used at Kitt Peak to study zonal and meridional winds in the atmosphere of Venus. Water vapor was detected in Comet Halley using Fourier transform spectrometer. The 2.65 micrometer upsilon sub 3 band was seen in emission, confirming non-thermal-equilibrium excitation models for comets. A study was made of the variability of Jovian ethane emission. The average volume mixing ratio of ethane in the Jovian stratosphere was found to be 3x10 to the -6 power, with the greatest variability seen in the auroral regions.

16972 (N—87-12407, pp vp) **Search for volatiles in the surface of icy satellites.** Brown, R.H. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

It is proposed to measure the reflectance spectra of the icy satellites of Jupiter, Saturn and Uranus in the spectral region 1.8 to 2.4 micrometers. These observations use the new Cooled Grating Array Spectrometer using a 32-element InSb photodiode array detector and produce spectra of higher resolution and precision than any data yet obtained; the ultimate scientific objective is to search for the signatures of methane clathrate, ammonium hydroxide or carbon monoxide clathrate (compounds predicted to exist on icy surfaces in the outer solar system by several theories of formation of these bodies) in the region of the spectrum where water ice has a relative maximum in reflectance. At the very least, these data will allow upper limits to be placed on the amount of these chemical species that can be present. The specific targets is Europa, Ganymede, Enceladus, Ariel and Titania, bodies that have the highest probability of having some or all of these volatiles on their surface according to current formation models.

16973 (N—87-12407, pp vp) **Theoretical and observational planetary physics.** Caldwell, J. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

This program supports NASA's deep space exploration missions, particularly those to the outer Solar System, and also NASA's Earth-orbital astronomy missions, using ground-based observations, primarily with the NASA IRTF at Mauna Kea, Hawaii, and also with such instruments as the Kitt Peak 4 meter Mayall telescope and the NRAO VLA facility in Socorro, New Mexico. An important component of the program is the physical interpretation of the observations. There were two major scientific discoveries resulting from 8 micrometer observations of Jupiter. The first is that at that wavelength there are two spots, one near each magnetic pole, which are typically the brightest and therefore warmest places on the planet. The effect is clearly due to precipitating high energy magnetospheric particles. A second ground-based discovery is that in 1985, Jupiter exhibited low latitude (+ or - 18 deg.) stratospheric wave structure.

16974 (N—87-12407, pp vp) **Portable high speed photometry systems for observing occultations.** Elliot, J.L.; Dunham, E.W. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Ring orbit studies for Uranus have been particularly fruitful because of the ability, through occultations, to obtain data of high spatial resolution at the rate of 1 to 2 times per year. The occultation program at M.I.T. involves: (1) identifying the scientific questions that can be answered by occultation events, (2) predicting the zone of visibility for the useful events, (3) maintaining and improving a set of portable high-speed photometric systems, (4) obtaining the observations, and (5) reducing the data and interpreting the results. Two stellar occultations by Uranus occurred in May 1985, and were observed with a network of large telescopes that encompassed the Northern and Southern Hemispheres. Portable quartz-oscillator time standards were used at all observatories, and were calibrated before and after each event. Observations obtained form Cerro Tololo and McDonald Observatories of the 4 May and 24 May 1985 occultations by the Uranian rings clearly show a companion to the delta ring on both the immersion and emersion traces. The occultation by Ceres that occurred on 12 November 1984 was observed. Preliminary results give a mean diameter of 933 + or - 10 km, which implies a geometric albedo, Pv = 0.07 + or - 0.01 and a density 2.7 + or - 0.3 gm cu/cm. Hence Ceres is likely composed of silicate material throughout.

16975 (N—87-12407, pp vp) **High-resolution imaging of solar system objects.** Goldberg, B.A. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

A very extensive Io sodium imaging program beginning with the first images of the cloud and culminating in comprehensive characterization of the cloud's appearance and behavior as a function of both time and Io's orbital position now forms the basis for a collaborative modeling analysis and a continued observational study with emphasis on understanding how the cloud's behavior is diagnostic of spatial and temporal variations in the physical conditions of the inner Jovian magnetosphere. The sodium cloud was found to have a variety of systematic variations, a pronounced east-west orbital asymmetry, and temporal changes which could be diagnostic of time changes in both Io and its plasma environment. New comet imaging programs initiated at the 3.6-meter Canada-France-Hawaii Telescope draw upon both ultra high time resolution and high spatial resolution imaging capabilities. Seven observing runs between Dec. 1984 and May 1986 were devoted to observing Halley, Giacobini-Zinner, and several other comets. Among these observations were the first images of Halley through IHW filters, and images of Giacobini-Zinner during the ICE encounter which have been directly correlated with ICE magnetic field measurements.

16976 (N—87-12407, pp vp) **Research in planetary astronomy and operation of the 2.2-meter telescope.** Hall, D.N.B.; Cruikshank, D.P.; Morrison, D.; Sinton, W.M. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The turn-around in the secular change in brightness of Pluto was detected, the planet is now beginning to brighten. The spectral signature was found of an ammonia bearing compound in the surface ices of Europa. Specific Io volcanic hotspots were detected from infrared photometry of the mutual events of the Jovian satellites. The polarized emission from the volcanic hotspots on Io was discovered and the locations of those hotspots were determined. The orbit of Charon was refined from speckle observations of the Pluto-Charon system. The spectral properties of liquid nitrogen-methane mixtures with reference to the infrared spectrum of Triton were studied. Major progress was made in modeling asteroid light-curves from a modern theory of photometric properties of the asteroid surfaces. Several additional olivine-rich asteroids from near-infrared spectrophotometry were discovered. Important photometric, spectroscopic, narrow-band imaging data on Comet P/Halley was acquired, along with Schmidt photographs of Comet P/Halley and its tail.

16977 (N—87-12407, pp vp) **Planetary infrared astronomy using a cryogenic postdisperser on Fourier transform spectrometers.** Jennings, D.E.; Kunde, V.G.; Hanel, R.A.; Maguire, W.C.; Lamb, G.M. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

High resolution infrared spectra of planets from ground-based observatories were analyzed and instrumentation to improve sensitivity was developed. A cryogenic postdisperser (a narrow bandpass spectral filter) for use with Fourier transform spectrometers (FTS's) at facility observatories was constructed. This instrument has improved the sensitivity of FTS observations at 8 to 20 microns by about an order of magnitude. Spectra of Jupiter, Saturn and Comet Halley were obtained using the postdisperser with FTS facilities at the Kitt Peak 4-meter and McMath telescopes. Spectral resolution as high as 0.01/cm was achieved.

16978 (N—87-12407, pp vp) **Infrared observations of outer planet satellites.** Johnson, T.V. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Infrared observations were made of the outer planet satellites. These data provide vital information about the thermophysical properties of satellite surfaces, including internal heat sources for Io. Observations include both broad and narrow band measurements in the 2 to 20 micrometer spectral range. Types of observation and target priority were determined to make maximum use of existing data from Voyager and other missions, on-going and planned missions such as Galileo, were supported and techniques and data for planning new missions and instrumentation were developed.

16979 (N—87-12407, pp vp) **Planetary submillimeter spectroscopy.** Klein, M.J. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

A comprehensive observational strategy was developed for the detection and measurement of molecular lines in the millimeter and submillimeter spectra of planetary atmospheres and comets. A sound observational strategy and the associated analytical capability to begin observations from the Caltech Submm Observatory (CSO) on Mauna Kea in FY 87-88. Comet Halley was observed from the NASA-KAO with the dual-frequency (0.8 and 1.6 mm) receiver and conducted a search for NH_3 with the DSN 64 m antenna.

16980 (N—87-12407, pp vp) **Infrared spectroscopy of Jupiter and Saturn.** Knacke, R.F. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The origin of carbon monoxide has been a puzzle for some time, and it has become apparent that CO serves as a tracer of disequilibrium processes in the Jovian atmosphere. High resolution spectra with a Fabry-Perot spectrometer was obtained. From a detailed synthetic spectral analysis of the CO line profiles, it was established that the CO is located in the troposphere of Jupiter. It must therefore be a product of convection upward from hotter levels in the deep atmosphere, and is not a product of infall of material from above the stratosphere. Six lines of CO in Saturn was detected, a surprising result because disequilibrium models predicted that the CO mixing ratio would be too low to be observable if upward convection is the dominant mechanism. Therefore several possibilities for the origin of the CO now exist, none completely satisfactory at this time.

16981 (N—87-12407, pp vp) **Outer planet studies.** Lutz, B.L.; Lockwood, G.W. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Spectrophotometric observation were completed of Titan and determinations of its geometric and bond albedos and completion of like observations of Uranus, pre-Voyager encounter. CH_3D was studied in the spectrum of Uranus and a determination of the CH_3D/CH_4 mixing ratio in its atmosphere. The observations needed for a direct calibration of the Sun against Vega was completed. The study was continued of CH_3D in the spectra of Saturn

and Titan. High resolution observations of O I, C2 and C-12 C-13 in the coma of P/Halley were also studied.

16982 (N—87-12407, pp vp) **Modeling and investigative studies of Jovian low frequency emissions.** Menietti, J.D.; Green, J.L.; Six, N.F.; Gulkis, S. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The Voyager data in a newly produced noise-reduced and recalibrated format has been received. New color spectrograms were developed on high resolution color terminals which display this data. The production of these new spectrograms utilizing the new format data is quite important, because it eliminates a serious problem of noise contamination and miscalibration in the old data set. In addition, a new Jovian plasma model was introduced, which includes the Io torus and accounts for 7 ionic species. The new plasma model is important in the ray tracing of hectometric (HOM) and kilometric (KOM) radiation which may be influenced by the Io torus.

16983 (N—87-12407, pp vp) **Submillimeter and millimeter observations of solar system objects.** Muhleman, D.O. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The millimeter wavelength 3-element array at OVRO was used to observe Halley's comet in carbon monoxide (negative result) and to set an upper limit from continuum flux of 15 km on the size of the nucleus, assumed to be a black body. The Saturn system was observed with the array and ring brightness temperatures at a wavelength of 2.7 mm were obtained. A B-ring temperature of 30 K was compared to the results at lambda = 2 cm of about 7 K indicates the measurement of true emission from the ring particles at mm-wavelengths. Brightness temperatures of Titan, Neptune, Uranus, Io, Europa, Ganymede, and Callisto were made, all tied to Mars. Accurate microwave spectra of all these objects from 3 mm to 6 cm were obtained.

16984 (N—87-12407, pp vp) **Lunar and planetary studies.** Muhleman, D.O. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Observations were made and analyzed for Uranus, Saturn, and Titan in the continuum at the VLA and some spectroscopy at OVRO. Accurate A, B, C rings brightness temperatures from Saturn are a basis of scattering theory calculations. Variations of 2 cm limb darkening with pole orientation were modeled and are shown to originate in the deep atmosphere.

16985 (N—87-12407, pp vp) **Infrared observations of planetary atmospheres.** Orton, G.S.; Baines, K.H.; Bergstralh, J.T. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Infrared data was obtained on planetary atmospheres which provides critical information on atmospheric structure, composition, and cloud properties in support of planetary missions such as Voyager and Galileo. Mapping of Jupiter and Saturn in thermal and reflected solar radiation is a high-priority monitoring and exploratory activity. Some of these images of Jupiter are shown. Radiation at 17.8 micrometer probes the upper tropospheric temperature structure where spatial structure bears a strong resemblance to visible and near-infrared reflected sunlight such as at 2.0 micrometer. At 7.8 micrometer, stratospheric temperatures appear to have a three-banded structure, enhancements near the magnetic poles and occasional transient features such as the equatorial filament near the right limb. Clouds or hazes are observed high in the stratosphere looking at wavelengths such as 2.2 micrometer, where gaseous opacity is very strong. Other maps examine cloud properties from thermal radiation not strongly influenced by gaseous opacity and the distribution of condensable gases, such as ammonia. Millimeter and submillimeter filtered radiometric observations were made of Jupiter, Uranus and Neptune via collaborative work. Radiometric observations of Uranus and Neptune at 21 and 32 micrometer were acquired and analyzed as well as grating array spectra in the ranges of 8 to 14 micrometer, 16 to 23 micrometer, and 18 to 32 micrometer. These showed evidence for C_2H_2 in the stratosphere of Uranus and C_2H_4 in the stratosphere of Neptune.

16986 (N—87-12407, pp vp) **Spectroscopic observations of the planets.** Owen, T. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The first phase of a program to determine D/H in the atmospheres of all of the major planets and Titan was completed. D/H on Titan and Uranus is significantly higher than on Jupiter and Saturn. Titan has the highest value, consistent with the possibility for hydrogen escape. These measurements were all made in terms of CH_3D/CH_4. They suggest that at least two reservoirs for deuterium exist in the outer solar system - a large one in hydrogen and a much smaller one in hydrogen-containing compounds that have not isotopically equilibrated with the hydrogen. This result also demonstrates that a large fraction of the carbon in the outer solar nebula was in the form of methane and it supports the nucleation model for the formation of the outer planets. Other studies included an investigation of the phosphine abundance over the Great Red Spot (GRS) of Jupiter, pre-Voyager determination of the amount of acetylene on Uranus, and the carbon isotope ratio in Halley's Comet. UV spectra of the GRS obtained with the IUE show no evidence of the enhancement of phosphine that would be expected if the red color of this object is caused by P4.

16987 (N—87-12407, pp vp) **Ground-based observations of the Jupiter plasma torus.** Scherb, F.; Rossler, F.L. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The intensity variation of (SIII) 9531 A emission from the hot plasma torus of Jupiter was measured using a scanning Fabry-Perot spectrometer. During the observational period, which covered 43 rotations of Jupiter, the (SIII) intensities showed a periodic variation consistent with a zone of enhanced emission approximately 90 deg in longitude, rotating with a period of 10.2 hours, or 2.8% longer than Jupiter's rotational period. Dessler developed a theoretical model of account for Jovian magnetospheric phenomena that differ in repetition period by 3%. In his model, periodic modulation of magnetospheric phenomena is controlled in part by the spin period of magnetic features below the surface of the planet. The differing observed periods are then due to differential rotation of the subsurface magnetic features at different latitudes. A consequence that follows from this concept of differential rotation of the internal planetary magnetic field is that not all the apparent subcorotational plasma flow in the torus is caused by plasma mass loading, as described by Hill and his associates. As a result, the mass loading required to produce the residual subcorotational flow is less than previously estimated.

16988 (N—87-12407, pp vp) **Continued program of planetary study at the University of Texas McDonald Observatory.** Smith, H.J.; Barker, E.S.; Cochran, W.D.; Trafton, L.M. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The beginning of eclipses of the Pluto-Charon system was detected. The onset of coma formation of P/Halley at 5.4 au was detected and evidence of sublimation at 4.8 au when CN emission was detected. Extensive spatial maps of the gas in the comae of comets Halley and Giacobini-Zinner were obtained in fall 1985. Halley was time variable, and Giacobini-Zinner was depleted in C_3 and C_2 relative to CN. Comet Kopff was shown to have a pre-perihelion brightness maximum of its gas, consistent with mantle development if the comet is a high obliquity object. New Haser model scale lengths for CN, C_2, and C_3 were determined using results from the Faint Comet Survey. Spectra of 12 asteroids in unusual orbits showed no evidence of any comet-like emission features. In particular, 3200 Phaethon (1983 TB) has no gas or dust coma, in spite of the similarity of its orbit with the Geminid meteor stream. Data were analyzed on Saturn's H_2 and CH_4 bands for the recent southern summer using a Tomasko-Doose type of haze distribution. This haze model fits the data moderately well, giving a CH_4 mixing ratio of (4.2 + or 0.4)x003. Simple functions were found to approx-

imate the collision-induced rotation-translation thermal opacity of H_2.

16989 (N—87-12407, pp vp) **Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions.** Smith, W.H. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Profiles were obtained for Uranus at a spectral resolution exceeding 450,000 for four quadrupole lines of H_2. A preliminary reduction of the line profile for the S3(0) transition is shown. Excellent data for the determination of the HD abundance for Uranus was obtained for the R5(0) and R5(1) transitions. An HD profile is shown. Preliminary analysis yields a value for the D/H ratio similar to that for Jupiter. Complete spatial coverage was obtained of Jupiter in spectrally resolved NH_3 lines for which the molecular parameters are known. The S4(1) and S3(1) H_2 features for Neptune were observed. While the S4(1) feature has the same equivalent width as for Uranus, the S3(1) feature is about 40% smaller. The Titan observations have confirmed the previous observations of the 6819 A CH_4 feature for Titan. The profile width is consistent with the surface pressure determined via Voyager observations.

16990 (N—87-12407, pp vp) **Research in planetary astronomy at Palomar Observatory.** Soifer, B.T.; Goldreich, P. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The goals of this program are three fold. The ring systems in the outer solar system were studied. New comets and asteroids in the solar system were surveyed. The volatile surface coverings of the primitive bodies in the outer solar system were studied via infrared spectroscopy.

16991 (N—87-12407, pp vp) **Analysis of Jovian decametric data: study of radio emission mechanisms.** Staelin, D.H. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Catalogues of approx. 200 decametric arcs and approx. 200 gaps between arcs were studied, in an effort to reconcile the data with predictions for the model wherein reflections of Io-induced currents each emit in a conical pattern and yield a distinct radio arc. The most recent interpretations of this data suggest that these Io-produced Alfven waves persist for at least one or two passages of Io, and that the emission cone half angles are approx. 40 to 90 deg., varying from arc to arc. Below 1.2 MHz it was discovered that Jupiter emits radiation strongly modulated in frequency with periods of approx. 200 kHz; this quasi-sinusoidal emission (MSA) can shift more than 180 deg. in phase over periods of 6 seconds, although these shifts are usually much smaller. MSA is not strongly correlated with the longitudes of Io or Jupiter, and typically occurs in patches covering approx. 500 kHz or more for periods of a few minutes. Furthermore, this modulation sometimes resembles a train of impulses in frequency with exponential decays toward high frequencies. Comparison of these results with the previous studies of V-shaped S-bursts is suggestive of an emission mechanism.

16992 (N—87-12407, pp vp) **Planetary Fabry-Perot spectroscopy.** Trauger, J.T. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Uranus and Jupiter HD/H_2 spectra determine bulk D/H ratios which are significantly different from theoretical expectations, with the Uranus D/H about half the Jovian value. Feasibility of Mars photochemistry study with a PEPSIOS spectrometer was demonstrated with visible band O2, H_2O, and CO_2 spectra; and near infrared (1.57 micron) spectra of CO and CO_2; and NASA/IRTF observations have been proposed in support of the Mars Observer mission objectives. Analysis of monochromatic images clearly resolve the azimuthal and radial structure in the Jovian nebula (ion partitioning, temperature structure, ion/neutral interactions), adding a unique and important post-Voyager perspective and providing a baseline for forthcoming Galileo experiments. Simultaneous ground based and IUE observations of Jovian nebula are under analysis. Doppler resolved image sequences (data cubes) of Io sodium neutrals clearly isolate the high velocity charge exchange jet, a sensitive ground-based probe of the tenuous neutral atmosphere of Io.

16993 (N—87-12407, pp vp) **Visible phase curves of Uranus and Neptune and scattering in their atmospheres.** Wenkert, D. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The Voyager 1 and Voyager 2 narrow angle cameras have been imaging Uranus and Neptune (through several filters) from distances of several AU for the past four years. The justification for this is to determine the way in which the albedoes of the two planets vary with angle from the sun. The Voyager 1 spacecraft has already reached a phase angle of approx. 40 deg. for Neptune and approx. 70 deg. for Uranus. The albedo of a gaseous planet depends on the phase angle (angle from the sun through the planet to the observer), the color being observed, and the vertical distribution and nature of aerosols and clouds in the atmosphere of the planet. Since the colors are known and the phase angles, and phase curves will be used to constrain models of the aerosol and cloud structures of Uranus and Neptune. A knowledge of the way albedo varies with phase angle allows one to compute the total amount of sunlight being absorbed by a planet. With knowledge of the solar flux incident on the planet and knowledge of how much infrared is being emitted by the planet (at least in the direction of the Earth and sun) one can determine a rough extimate of the internal heat source of the planet. Although Jupiter and Saturn have measured internal heat sources of magnitude comparable to their absorbed energy from the sun, preliminary results indicate that Uranus may not have an internal heat and that Neptune if it has one that heat source is small.

16994 (N—87-12407, pp vp) **Observations of comets and asteroids.** Ahearn, M.F. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The origin and evolution of the solar system is studied by carrying out a wide variety of observational programs on the small bodies of the solar system. The more immediate observational goal is to determine the physical and chemical nature primarily of comets and secondarily of asteroids. This requires observations at all wavelengths from ultraviolet to radio as well as theoretical modelling.

16995 (N—87-12407, pp vp) **Planetary research at Lowell Observatory.** Baum, W.A.; Millis, R.L.; Lutz, B.L.; Bowell, E.L.G.; Kreidl, T.J.; Schleicher, D.C. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Narrowband CCD profiles of C2 and grains in several comets (including P/Halley and P/Giacobini-Zinner) were performed. Rotational light curves were made of Comet P/Arend-Rigaux (visible and infrared) yielding the size, shape, albedo, and rotation period of the nucleus. Production rates were measured as a function of heliocentric distance for OH, CN, and C2 in P/Giacobini-Zinner and for OH, NH, CN, C3, and C2 in P/Halley. Detection and measurement was made of forbidden (O I) lines near 6300 and 5577 A in P/Halley, permitting the production rate of oxygen from CO to be distinguished from that from H_2O. Identification of C-12, C-13 lines in cometary spectra indicating a possible enrichment of C-13 over the telluric value was made. An assessment of techniques for detecting (determining the existence of) a trans-Neptunian comet belt is included.

16996 (N—87-12407, pp vp) **Infrared spectral studies of asteroids.** Bell, J.F. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The first comprehensive spectrophotometric survey in the near-infrared (0.8 to 2.5 microns) was carried out with the NASA Infrared Telescope Facility and special filters optimized for spectroscopy of solid surfaces. About 105 asteroids have been observed (in 52 photometric passbands) to date. These spectra provide a much improved database for determining the mineralogy of the various asteroid spectral classes previously defined on the basis of

visible (0.3 to 1.0 micron) data. Preliminary results from analysis of these spectra include: (1) Class A asteroids are dominated by olivine and correspond to the rare brachinite meteorites; (2) Class S asteroids have highly variable olivine/pyroxene ratios inconsistent with chondritic compositions; (3) Classes P and D are apparently ultracarbonacous material which extends the known range of chondrites to lower condensation temperatures; (4) the distribution of spectral types shows that the asteroids were heated by a mechanism whose intensity declined rapidly with solar distance; and (5) Spectra of the proposed flyby targets for CRAF were used to evaluate the results obtainable from this mission.

16997 (N—87-12407, pp vp) **Studies of asteroids and comets.** Bowell, E.L.G.; Lumme, K.; Wasserman, L.C.; Kreidl, T.J.N.; Bus, S.J.; Skiff, B.A. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

About 3000 accurate positions of asteroids and comets were measured concentrating particularly on close-Earth approachers, but also targeting asteroids in need for follow-up observations because of unusual orbital characteristics or poor observational history. In 1985, 36 of the discoveries were numbered. Very accurate + or - 0.1 arcsec?) positional measurements were made of P/Halley on four nights in November and December 1985 in support of Giotto mission navigation. The asteroid orbit files were maintained, and ephemeris data for observational planning were supplied to colleagues worldwide. Considerable progress was made in understanding how information on asteroid shapes, surface albedo variegation, and rotational states can be derived from lightcurve and phase curve data. The analytical formulation was completed of a new asteroid magnitude system for the International Astronomical Union; the system was adopted at the New Delhi General Assembly by IAU Commission 20. Photographic photometry of about 10000 images of faint asteroids observed during the course of the United Kingdom Schmidt-CalTech Asteroid Survey in 1981 was continued, completing the microdensitometric scanning and all process of software development for data handling.

16998 (N—87-12407, pp vp) **Imaging studies of comets.** Brandt, J.C. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Extensive photography was conducted on comet Giacobini-Zinner in support of the flyby of the International Cometary Explorer (ICE) through the plasma tail on 9/11/85, and a dense series of plates was secured of Halley's Comet during the 7-month interval approximately centered on perihelion, i.e., 1985 November - 1986 May. The hundreds of high quality plates of Halley contain copious numbers of dramatic plasma events, including DE's, helical waves, and turning tail rays. Initial study of the plate material lends support to the magnetic sector boundary model of DE's developed by Niedner and Brandt.

16999 (N—87-12407, pp vp) **Atlas of Comet Halley 1910 II.** Brandt, J.C.; Donn, B. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

An Atlas of Comet Halley 1910 II photographs and spectra is being prepared. The major section consists of 838 photographic observations from fifteen observatories around the world. Multiple images of many photographs are reproduced to bring out detail in the near nucleus region, in the coma and in the tail. The Atlas contains a total of 1209 photographic images of the 1910 apparition. In addition there are sections showing drawings from 1935 and 1910. A short section compares 1910 drawings and photographs. The final two sections display digitally processed images from 1910 and 1910 spectra. A three part appendix contains diagrams of various data associated with the 1910 apparition, a set of tables of all 1910 images and a bibliography.

17000 (N—87-12407, pp vp) **Composition of faint comets.** Brown, L.W. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The study uses an emission line, differential imaging camera built by the Science Operations Branch. This instrument allows photometric data to be obtained over a large area of a comet in a large number of resolution elements. The detector is a 100x100 Reticon array which with interchangeable optics can give resolutions from 2″ to 30″ over a field of 1′ to 15′. The camera through its controlling computer can simultaneously take images in on-line and continuum filters and through computer subtraction and calibration present a photometric image of the comet produced by only the emission of the molecule under study. Initial work has shown two significant problems. First the auxiliary equipment of the telescope has not allowed the unambiguous location of faint comets so that systematic observations could be made, and secondly initial data has not shown much molecular emission from the faint comets which were located. Work last year on a software and hardware display system and this year on additional guide motors on the 36-inch telescope has allowed the differential camera to act as its own finder and guide scope. Comet IRAS was observed in C2 and CO+, as well as an occultation by the comet of SAO029103. The perodic comet Giacobini-Zinner was also observed in C2.

17001 (N—87-12407, pp vp) **Infrared observations of small solar-system bodies.** Brown, R.H. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Observations of Europa using the Cooled Grating Array Spectrometer have resulted in the discovery of new absorption features in the spectrum of the trailing side of Europa which have been attributed to either magnetospherically implanted sulfur compounds or recently emplaced hydrates of ammonia. More observations are planned to determine which of these two classes of compounds are responsible. Two asteroid occultations have been observed so far, but with some negative results (the occultations paths shifted sufficiently that the groups responsible for timing the visual occultation got no data). High-quality data in the thermal infrared were obtained nevertheless; those data are useful for constraint of thermal models of asteroids and will be analyzed in that context. Work was completed to perfect a computer code that will fit a triaxial-ellipsoid thermal model to the IR data while constrained by the visual lightcurve.

17002 (N—87-12407, pp vp) **Infrared imaging and photometry of Comet Giacobini-Zinner.** Campins, H. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Infrared images and photometry were obtained to determine the spatial distribution and physical characteristics (temperature, albedo, size distribution, total mass, etc.) of the grains in the coma of Comet GZ. A 10.8 m image of Comet GZ obtained on August 4 represents the first ground-based thermal-infrared image of a Comet. Among the most significant results are: (1) an estimate of the number of grains that the ICE spacecraft must have encountered, which led the plasma wave team to conclude that they could only detect impacts on the antennae and not on the whole body of the ICE spacecraft; (2) the discovery of a population of large grains (radius > 100 micrometer), not observed in most other comets, which formed a curved tail near the nucleus (within 80 arcsec or 34,000 km); and (3) the detection of structure in the spatial distribution in the coma of the particle albedo, which was tentatively attributed to the presence of very fluffy grains which are likely to have multiple internal scattering of incident sunlight. The albedo map of Comet GZ was obtained by combining the 10.8 micrometer image shown with a simultaneous image taken at 0.68 micrometer, a bandpass which isolates the scattered continuum.

17003 (N—87-12407, pp vp) **Planetary astronomy.** Chapman, C.R.; Davis, D.R.; Greenberg, R.; Hartmann, W.K. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Comets were studied during their relatively quiescent phases at large distances from the sun. This program has resulted in a variety of CCD images of comets in several visible and near-IR bands selected to sample the continuum, rather than emission features. The most extensive dataset was obtained for P/Halley during January 1985 (plus scattered earlier data), near the time the comet turned on. The data were reduced in a preliminary fashion. Other comets predicted to be relatively inactive (including Neujmin 1 and

Arend-Rigaux) were most active than expected. P/Gehrels 3 was also observed.

17004 (N—87-12407, pp vp) **Speckle interferometry applied to asteroids and other solar system objects.** Drummond, J.D.; Hege, E.K. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Speckle interferometry is a high angular resolution technique that allows study of resolved asteroids. By following the changing size, shape, and orientation of minor planets, and with a few general assumptions (e.g., geometric scattering, triaxial ellipsoid figures, no albedo features), it is possible to directly measure an asteroid's true dimensions and the direction of its spin axis in one or two nights. A particular subset of triaxial ellipsoid figures are equilibrium shapes, and would imply that some asteroids are thoroughly fractured. Such shapes if they exist among the asteroids would allow a determination of bulk density since there is a unique relation among spin period, size, shape, and density. The discovery of even a single rubble pile, (just as the finding of even one binary asteroid by speckle interferometric techniques) would drastically alter the notion of asteroids as small solid planets. The Pluto/Charon system was studied to aid in improving the orbital elements necessary to predict the eclipse/occultation season currently in progress. Four asteroids were reduced to their size, shape, and pole direction: 433 Eros, 532 Herculina, 511 Davida, and 2 Pallas.

17005 (N—87-12407, pp vp) **Planetary spectroscopy.** Fink, U. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Infrared spectroscopic studies of the solar system in support of spacecraft investigations were researched. The studies include the physical behavior of comets, the atmospheres of the gaseous planets, and the solid surfaces of satellites and asteroids. Studies of the gaseous and solid emanations of comets using the techniques of CCD spectroscopy and imaging were focused on. An intensive observational effort was mounted, to observe comet Halley with the recently developed state of the art CCD camera system. Comet P/Giacobini-Zinner was observed. The major emphasis was placed on spectroscopy and a synoptic spectrum at least once a month was obtained. A large number of images of Halley for particular emission species and continuum regions were also obtained. The species in vestigated were: C3 (4060 A), CO+ (4505), C2 (5139), NH_2 (5980), H_2O+ (6185), OI (6300) and CN (9180).

17006 (N—87-12407, pp vp) **Optical investigation of Comet Halley.** Jewitt, D.C. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The optical properties of comet p/Halley are being investigated. Initial research has revealed the basic characteristics of the nucleus and provided unique insights into the formation and structure of the coma and the plasma tail. The study is among the most intensive conducted for any comet. The results from comet p/Halley may be useful in the interpretation of results from other comets.

17007 (N—87-12407, pp vp) **Cometary spectroscopy.** Larson, S. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The spectroscopic and morphological characteristics of comets over a wide range of heliocentric distances are investigated as they may suggest or constrain models of cometary formation environments and evolution. This program also contributes to the understanding of the general comet population with which spacecraft data will be compared. Long slit spectra and direct images of all observable comets (M2<18) are obtained on a monthly basis with either a UV sensitive microchannel plate or a red sensitive CCD spectrograph/camera. Scale lengths of the principal emission of OH, NH, CN, C_3, C_2, NH_2 and OI different comets can be compared. The direct images are used for studies of dust anisotropy which can provide data on the spin vector and gross surface morphology.

17008 (N—87-12407, pp vp) **Infrared observations of planets.** Lebofsky, L.A.; Rieke, G.H. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

A positive correlation was found between the strength of the 3-micron water feature and the strength of the absorption feature shortward of 0.4 microns. This is similar to what is seen in laboratory spectra of carbonaceous chondrites whose silicate compositions range from hydrated phyllosilicates to anhydrous olivine. Features were found in the IRAS images that appear to be related to solar system objects. Analysis of the data has yielded narrow trails of dust coincident with the orbits of comets Temple 2, Encke, and Gunn. Dust is found both ahead and behind comet orbital positions due to low-velocity ejection of large particles during perihelion passage. The occultation diameters of Ceres and Pallas were used to improve the standard thermal model used in the reduction of thermal IR observations of asteroids.

17009 (N—87-12407, pp vp) **Asteroid team.** Matson, D.L. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Work on asteroid classification continued was rewarded with the discovery of two Earth-approaching M asteroids. The M class is rare and these are the first found among the near-Earth asteroids to have the spectral albedo characteristic of this class. The two asteroids are newly discovered 1986 DA and 1986 EB, which were observed at N and Q bandpasses (i.e., 10 and 20 microns) with the 3 m IRTF telescope and at five wavelengths from 0.36 to 0.85 microns from Kitt peak National Observatory's 0.36 m telescope. The derived diameters are about 2 km for both objects. In the asteroid radiometry program N or Q photometry was obtained for more than 40 asteroids in Feb. 1986. Radiometric diameter calibration support were provided for stellar occultations of stars by 230 Athamantis and 129 Antigone. The data were reduced but not analyzed. Infrared spectra (0.8 to 2.6 microns) of 60 asteroids were reduced and are now ready for compositional analysis.

17010 (N—87-12407, pp vp) **Planet-crossing asteroids: interrelationships within the solar system.** Mcfadden, L.A.; Ahearn, M.F. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Near-infrared reflectance spectra, 0.6 to 2.5 micrometer, were acquired of asteroids 1627 Ivar (Amor), 43 Ariadne, 335 Roberta, 386 Siegena and 695 Bella (3:1 Kirkwood Gap) with the IRTF, Mauna Kea. CCD spectra 0.5-1.0 micrometer were acquired of 1866 Sisyphus (Apollo), 17 Thetis, 695 Bella, 797 Montana, and 877 Walkure (3:1 Kirkwood Gap) using facilities at Cerro Tololo Inter-American Observatory. An upper limit on the production rate of CN in asteroid 3200 Phaeton of $< 4 \times 10$ to the 23rd power sec was determined based on photometric measurements at 3871A using facilities at Lowell Observatory. This value is in the range of the lowest production rate measured for a comet, however, it does not constitute a positive detection of CN in this asteroid. A first attempt of look for companion objects or evidence of dust debris associated with this asteroid was made with a CCD camera. Whereas the search extended to 19th magnitude (corresponding to 150m and 330m for albedos of 0.15 and 0.03 respectively), a look close enough to the asteroid was not attained to definitively eliminate the presence of coorbiting dust debris.

17011 (N—87-12407, pp vp) **Physical processes in comets.** Newburn, R.L. Jr. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Final revisions were made in the study of continuum spectrophotometry of 17 comets done at Lick Observatory. Changes based upon this study were introduced into the Divine-Newburn cometary modelling paradigm. Work was begun on modifications to all of the theory based upon the direct nucleus and coma observations made by the Halley space missions.

17012 (N—87-12407, pp vp) **Ground-based observation of Comet Halley.** Scherb, F.; Roesler, F.L. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Approximately five hundred Fabry-Perot scans of H_3O+, H alpha, and (OI) emissions from comets Halley, Hartley-Good, and Thiele were obtained at Kitt Peak in November, December and January. The analysis of the data is in a very early stage, but preliminary results were obtained on the production rate Q(H) of hydrogen, Q(D) of metastable oxygen, and Q(H_2O) of water. The rate Q(H) varied with heliocentric distance R as R to the power -3.5 + or - 0.5. The rate Q(D) varied as R to the power -4.8 + or - 0.1. The ratio of Q(H_2O) to Q(D) was 15 + or - 5.

17013 (N—87-12407, pp vp) **High resolution spectral imagery of comets.** Smith, W.H. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

C-13/C-12 data at a spectral resolution of 75,000, resolving the background interferences was obtained. Some data was obtained for N-15/N-14. In April, observations were obtained for the D/H ratio. The model analysis of these observations is beginning with the goal of presentation at the Heidelberg Halley meeting. A very large quantity of observations were obtained of both features with variations on the time scale of an hour being measured. At times, the 5577 feature dominates, and at times it is nearly absent. To date, a large body of data have been obtained for C_2, NH_2, (O I), and probably H_3O+, CN, and from the MKO data, OH. These features can all be correlated with respect to their relative velocities and distribution at the time of observation. The Greenstein effect will be used to measure similar results for CN, OH, and few other selected molecular features.

17014 (N—87-12407, pp vp) **Spatially resolved quantitative spectroscopy of comets.** Spinrad, H. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The pristine nucleus of a comet, in particular, its chemical composition is studied. More immediate goals are to quantitatively compare the mass-loss-rates of various periodic comets, and to map out the distribution of coma region ions and neutral radicals with the hope of indirectly determining their parent molecules.

17015 (N—87-12407, pp vp) **Physical properties of asteroids.** Veeder, G.J. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The physical properties of asteroids were studied by telescopic observations and laboratory and theoretical work. Spectrophotometry from 0.3 to 1.1 microns and 1.2, 1.6 and 2.2 micron photometry allow spectral-compositional classification of asteroids. Based on laboratory data and telescopic observations, it was found that infrared measurements at 1.2, 1.6 and 2.2 microns provide a relatively rapid and accurate method for the classification of minor planets and are important in comparing asteroids with meteorites. This technique was proven and employed in an expanded survey of Apollo-Amor-Aten and other unusual asteroids recently scanned by IRAS.

17016 (N—87-12407, pp vp) **Origin of asteroids and small bodies.** Williams, J.G.; Gibson, J. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

During the past year three periodic comets were recovered. They were Tsuchinshan 2, Whipple, and Daniel. Follow up positions on four newly discovered comets appeared on IAU cards: Machholz, Hartley, Maury, and Shoemaker 3. Halley was captured shortly after its 1985 conjunction and a set of exposures in late summer was one of the earliest showing tail development. A variety of interesting asteroids were also captured.

17017 (N—87-12407, pp vp) **Spectroscopy of comets.** Wyckoff, S.; Wehinger, P.A. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Comets constitute the most accessible samples of the outer solar system in its most primitive state. The physical and chemical properties of comet nuclei were determined to infer the conditions and processes related to the origin and evolution of the outer solar system. The procedure is to acquire and analyze digital spectra of a sample of comets covering a large range in heliocentric distance. During 1984 to 1986 the emphasis has been on Comet P/Halley (1982i). Large ground-based telescopes and state-of-the-art detectors were used to observe Comet P/Halley pre- and post-perihelion, covering a heliocentric distance range, 0.9 to 6.1 AU.

17018 (N—87-12407, pp vp) **Cometary dynamics.** Yeomans, D.K. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

In order to provide observers with accurate cometary ephemerides, up-to-date astrometric positions must be used to update the existing orbit and ephemeris for each object. In addition, nongravitational forces must be taken into account; these forces are assumed due to the rocket effect of outgassing cometary ices. Once successfully modeled, the cometary nucleus spin direction, spin axis evolution, and the volatility of the nucleus ices can be inferred. The predicted ephemerides also become far more accurate.

17019 (N—87-12407, pp vp) **Spectroscopic planetary detection.** Deming, D.; Espenak, F.; Hillman, J.J.; Kostiuk, T.; Mumma, M.J.; Jennings, D.E. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The Sun-as-a-star was monitored using the McMath Fourier transform spectometer (FTS) on Kitt Peak in 1983. In 1985 the first measurement was made using the laser heterodyne technique. The FTS measurements now extend for three years, with errors of order 3 meters/sec at a given epoch. Over this 3 year period, a 33 meter/sec change was measured in the apparent velocity of integrated sunlight. The sense of the effect is that a greater blueshift is seen near solar minimum, which is consistent with expectations based on considering the changing morphology of solar granular convection. Presuming this effect is solar-cycle-related, it will mimic the Doppler reflex produced by a planetary companion of approximately two Jupiter masses, with an 11 year orbital period. Thus, Jupiter itself is below the threshold for detection by spectroscopic means, without an additional technique for discrimination. However, for planetary companions in shorter period orbits (P approx. 3 years) the threshold for unambiguous detection is well below one Jupiter mass.

17020 (N—87-12407, pp vp) **Stellar observations with the Voyager EUV objective grating spectrograph.** Holberg, J.B.; Polidan, R.S.; Barry, D.C. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

During the periods of interplanetary cruise the Voyager ultraviolet spectrometers are used to provide unique and otherwise unobtainable observations in the extreme ultraviolet (EUV, 500 to 1200) and the far ultraviolet (FUV, 912 to 1220 A). These observations include the spectra of hot stellar sources as well as emission from the interplanetary medium. Recent results of note include: (1) extensive spectrophotometric coverage of a superoutburst of the dwarf nova VW Hydri, which showed a clear 1/2 day delay in the outburst at 1000 A relative to that observed in the optical and a curious dip in the FUV light curve near maximum light. The Voyager observations were part of a comprehensive and highly successful campaign involving EXOSAT, IUE and ground based observations of this dwarf nova; (2) a comprehensive study of Be star spectra and variability. These results show the critical importance of FUV observations in the study of the effects of stellar rotation in hot stars; (3) the detection of a strong O VI absorption feature in the spectrum of the PG 1159-like object H1504+65. This detection along with the optical identification of weak O IV lines was a key to the interpretation of this object; which is of extremely high (>150,000K) temperature and appears to be a unique example of a stellar atmosphere devoid of H and He; (4) an analysis of an extremely long duration spectrum of the EUV and FUV sky background, which establishes important new upper limits on both continuum and line emission. This result also provide the first detection of interplanetary Lyman gamma.

17021 (N—87-12407, pp vp) **Jets, mass outflows and disks associated with young stellar objects.** Strom, S.E. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Over the past 3 years, a series was obtained of the CCD images of regions surrounding young stellar objects (YSO's) located in a variety of environments with the goal of providing a census of the properties of mass outflows associated these objects. A catalog describing the optical morphology and kinematics of 38 mass outflows associated with young stellar objects (YSOs) was completed. The direct detection was reported of disks surrounding HL Tau and LI551/IRS 5 -- both sources of optical jets and large-scale mass outflows. In each case, the disk dimensions are on the order of several hundred astronomical units and the disk dust masses approximately 10 to the -7th power solar masses. A program aimed at indirect detection of circumstellar disks associated with YSOs was started. The technique involves comparison of an observed bolometric luminosity (L(bol)) with an independent measure of the true luminosity (L(spec)) of a YSO which derives from the observed strengths of surface-gravity-sensitive spectral features.

17022 (N—87-12407, pp vp) **Planetary optical and infrared imaging.** Terrile, R.J.; Smith, B.A. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Images were acquired of a circumstellar disk of orbiting material around the nearby star beta Pictoris. This material is believed to be associated with the formation of planets and provides a first look at a planetary system much younger than our own. Preliminary work was also done to acquire multicolor photometric data and polarimetry on the beta Pictoris disk as well. A coronagraphic search for other proto-planetary systems is also underway. Coronagraphic imaging provided the first clear images and a determination of the geometric albedo of the rings of Uranus. A search for material around the asteroid Amphitrite showed that the region around the asteroid was free of particles larger than 500 meters in radius or diffuse material with an optical depth larger than .000001. NASA IRTF infrared images of Jupiter and Saturn are providing information on the relative heights and cloud top temperatures of atmospheric features.

17023 (N—87-12407, pp vp) **Interplanetary and interstellar dust.** Sandford, S. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Several processed polycyclic aromatic hydrocarbons (PAH) samples were produced to date. The Raman spectra and D/H ratios of these samples will be studied in the near future. A manuscript was sent to Icarus which gives a detailed discussion of the possibility of using solar flare tracks in interplanetary dust particles (IDPs) to determine a cometary vs. asteroidal source of the IDPs. The technique looks promising and a program was started to measure the large number of IDP track density necessary to address the issue of the source(s) of the dust. The results could potentially tell a great deal about comets and/or asteroids.

17024 (N—87-12407, pp vp) **International Halley Watch: discipline specialists for photometry and polarimetry.** Ahearn, M.F. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The last of the 75 sets of standard filters were distributed, including re-allocation of several sets from north to south at the beginning of 1986. Observations of the photometric standard stars from several observatories were collected and synthesized into a standard system of magnitudes. Transformation equations were derived to yield absolute fluxes in various cometary emission bands and in the continuum. These transformations turned out to vary with the comet's radial velocity for some filters and with the filter's temperature for some filters, and from one set of filters to another, all effects were quantitatively assessed. Non-linearities in the extinction, observed through the OH filter, were modelled and techniques for linearizing the extinction were developed. Although not among the official goals of the IHW, NASA Headquarters chose to work through the IHW to develop two CCD camera systems. Two iterations of an archive format were performed and a third is in the works.

17025 (N—87-12407, pp vp) **International Halley Watch: discipline specialists for radio science.** Irvine, W.M.; Schloerb, F.P.; Gerard, E.; Brown, R.D.; Godfrey, P. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Some 34 radio observatories in 18 countries are participating in the Radio Science Net of the International Halley Watch. Approximately 100 radio astronomers are contributing to this effort, which has included observations of comets P/Crommelin and P/Giacobini-Zinner as well as P/Halley. It is clear that the record of data for the 18 cm OH ground state lambda doublet, which provides fundamental information on the gas production rate, kinematics, and potentially the magnetic field in the coma, will be vastly more complete and of higher accuracy than has even been obtained on any previous comet. The coverage by a number of radio observatories will enable short period variations to be studied and correlated with simultaneous data obtained at other wavelengths. Likewise, the first definitive detection of the important parent molecule hydrogen cyanide in a comet was obtained and is being studied by groups in the United States, Sweden, and France. The first detection of the comet with the Very Large Array telescope operated by NRAO was achieved and has produced exciting results for the distribution of emission at high angular resolution from the OH radical. At this writing data are still being obtained and being processed, and there are still strong indications that exciting information will be obtained from radar studies of P/Halley and from searches for additional parent molecules.

17026 (N—87-12407, pp vp) **International Halley Watch: discipline specialists for infrared spectroscopy and radiometry.** Knacke, R.F.; Encrenaz, T. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The Infrared Net has been active in all areas of comet science in its domain. The more than 100 members of the net and 30 participating observatories are still engaged in observations, and only a preliminary discussion of the highlights of the program is possible at this time.

17027 (N—87-12407, pp vp) **International Halley Watch: discipline specialists for near-nucleus studies.** Larson, S.; Sekanina, Z.; Rahe, J. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

The purpose of the Near-Nucleus Studies Net is to study the processes taking place in the near-nucleus environment as they relate to the nature of the nucleus. This is accomplisghed by measuring the spatial and temporal distribution of dust, gases and ions in the coma on high resolution images taken from many observatories around the world. By modeling the motions of discrete dust features in Comet Halley, it is often possible to determine the locations of the emission sources on the surface and learn about the nucleus structure. In addition to the general goals shared by all IHW nets, the scientific goals of the net has been to determine (1) the gross surface structure of the nucleus, (2) the nucleus spin vector, (3) the distribution and evolution of jet sources and (4) the interrelationships between the gas, dust and ion components of the coma. An additional Comet Giacobini-Zinner watch was carried out by the NNSN in support of the NASA International Cometary Explorer flyby.

17028 (N—87-12407, pp vp) **International Halley Watch: discipline specialists for spectroscopy and spectrophotometry.** Wyckoff, S.; Feston, M.C.; Wehinger, P. Sep 1986. NTIS, PC A10/MF A01. (NASA-TM—89189; NAS—1.15:89189).

In Reports of planetary astronomy, 1985.

Spectroscopic observations of Comets P/Crommelin, P/Giacobini-Zinner and P/Halley are coordinated, preliminary results are delivered to the astronomical community and the data collected from observers throughout the world are archived. The ASU IHW Center has the additional responsibility of maintaining the IHW Electronic Bulletin Board which reports real-time information on

the status of Comet P/Halley. Access to this electronic bulletin board via telephone modem connection is available to any astronomer upon request.

17029 **(N—87-12508) Antarctic meteorite newsletter, volume 9, number 1.** (National Aeronautics and Space Administration, Houston, TX (USA). Lyndon B. Johnson Space Center). Feb 1986. 29p. (NASA-TM—89230; NAS—1.15:89230). NTIS, PC A03/MF A01.

Topics addressed include: petrographic descriptions of new meteorites; homogeneous powders of Antarctic meteorites; policy on consortium studies, and saw-cut surfaces of Shergottite EETA79001.

17030 **(N—87-12510) Chromospheric activity of cool giant stars. Final report.** Steiman-Cameron, T.Y. (Carnegie Institution of Washington, DC (USA)). Nov 1986. 9p. (NASA-CR—177184; NAS—1.26:177184). NTIS, PC A02/MF A01.

During the seventh year of IUE twenty-six spectra of seventeen cool giant stars ranging in spectral type from K3 thru M6 were obtained. Together with spectra of fifteen stars observed during the sixth year of IUE, these low-resolution spectra have been used to: (1) examine chromospheric activity in the program stars and late type giants in general, and (2) evaluate the extent to which nonradiative heating affects the upper levels of cool giant photospheres. The stars observed in this study all have well determined TiO band strengths, angular diameters (determined from lunar occulations), bolometric fluxes, and effective temperatures. Chromospheric activity can therefore be related to effective temperatures providing a clearer picture of activity among cool giant stars than previously available. The stars observed are listed.

17031 **(N—87-12519) Extended atmospheres of outer planet satellites and comets. Annual report, 1 August 1985-31 July 1986.** Smyth, W.H.; Combi, M.R. (Atmospheric and Environmental Research, Inc., Cambridge, MA (USA)). Sep 1986. 28p. (NASA-CR—176888; NAS—1.26:176888). NTIS, PC A03/MF A01.

An analysis of the extended atmospheres of outer planet satellites and comets is made. Primary emphasis is placed on cometary atmospheres because of the return of Comet P/Halley. As part of a collaborative effort with A.I.F. Stewart, observations of the hydrogen coma of Comet P/Giacobini-Zinner obtained from the Pioneer Venus Orbiter ultraviolet spectrometer (PVOUVS) were successfully analyzed at AER and are reported. In addition, significant pre-modeling and post-modeling activities to support and analyze the PVOUVS observations of Comet P/Halley successfully acquired in late 1985 and early 1986 are also discussed. Progress in model preparation for third-year analysis of the Voyager UVS Lyman-alpha brightness distribution emitted by hydrogen atoms in the Saturn system is also summarized.

17032 **(N—87-12520) Pioneer 10 and 11 (Jupiter and Saturn) magnetic field experiments. Final report.** Jones, D.E. (Brigham Young Univ., Provo, UT (USA)). Oct 1986. 133p. (NASA-CR—179856; NAS—1.26:179856). NTIS, PC A07/MF A01.

Magnet field data obtained by the vector helium magnetometer (VHM) during the encounters of Jupiter (Pioneer 10 and 11) and Saturn (Pioneer 11) was analyzed and interpreted. The puzzling characteristics of the Jovian and Saturnian magnetospheric magnetic fields were studied. An apparent substorm (including thinning of the dayside tail current sheet) was observed at Jupiter, as well as evidence suggesting that at the magnetopause the cusp is at an abnormally low latitude. The characteristics of Saturn's ring current as observed by Pioneer 11 were dramatically different from those suggested by the Voyager observations. Most importantly, very strong perturbations in the azimuthal ring current magnetic field suggest that the plane of the ring was not in the dipole equatorial plane, being tilted 5 to 10 deg. relative to the dipole and undergoing significant changes during the encounter. When these changing currents were corrected for, an improved planetary field determination was obtained. In addition, the ring and azimuthal currents at Saturn displayed significantly different time dependences.

17033 **(N—87-12522) Simultaneous solar maximum mission (SMM) and very large array observations of solar active regions. Annual report, 1 September 1985-30 October 1986.** Lang, K.R. (Tufts Univ., Medford, MA (USA)). Oct 1986. 158p. (NASA-CR—177187; NAS—1.26:177187). NTIS, PC A08/MF A01.

The research deals mainly with Very Large Array and Solar Maximum Mission observations of the ubiquitous coronal loops that dominate the structure of the low corona. As illustrated, the observations of thermal cyclotron lines at microwave wavelengths provide a powerful new method of accurately specifying the coronal magnetic field strength. Processes are delineated that trigger solar eruptions from coronal loops, including preburst heating and the magnetic interaction of coronal loops. Evidence for coherent burst mechanisms is provided for both the Sun and nearby stars, while other observations suggest the presence of currents that may amplify the coronal magnetic field to unexpectedly high levels. The existence is reported of a new class of compact, variable moving sources in regions of apparently weak photospheric field.

17034 **(N—87-12523) Solar flare x-ray polarimetry. Final scientific report, 1 April 1984-30 September 1986.** Chanan, G.A.; Novick, R. (California Univ., Irvine (USA)). Oct 1986. 36p. (NASA-CR—179899; NAS—1.26:179899). NTIS, PC A03/MF A01.

The motivation for high quality solar flare x-ray polarization measurements are discussed in general. The design of the proposed instrument is described and then the sensitivity and energy response are discussed. The laboratory work which demonstrates that the earlier lithium contamination problem was solved is described.

17035 **(N—87-13363) Infrared reflection nebulae in Orion molecular cloud 2.** Pendleton, Y.; Werner, M.W.; Capps, R.; Lester, D. (National Aeronautics and Space Administration, Moffett Field, CA (USA). Ames Research Center). Jun 1986. 46p. (NASA-TM—88259; A—86276; NAS—1.15:88259). NTIS, PC A03/MF A01.

New obervations of Orion Molecular Cloud-2 have been made from 1-100 microns using the NASA Infrared Telescope Facility and the Kuiper Airborne Observatory. An extensive program of polarimetry, photometry and spectrophotometry has shown that the extended emission regions associated with two of the previously known near infrared sources, IRS1 and IRS4, are infrared reflection nebulae, and that the compact sources IRS1 and IRS4 are the main luminosity sources in the cloud. The constraints from the far infrared observations and an analysis of the scattered light from the IRS1 nebula show that OMC-2/IRS1 can be characterized by L less than or equal to 500 Solar luminosities and T approx. 1000 K. The near infrared (1-5) micron albedo of the grains in the IRS1 nebula is greater than 0.08.

17036 **(N—87-13365) Observational study of ion-electron equilibration and of cloud evaporation in supernova remnants under the HEAO-2 guest investigator program. Final project report, 1 June 1985-30 September 1986.** Teske, R.G. (Michigan Univ., Ann Arbor (USA)). Sep 1986. 11p. (NASA-CR—179922; NAS—1.26:179922). NTIS, PC A02/MF A01.

Observations of three selected supernovae remnants (Cygnus Loop, IC 443, and Puppis A) were made in the forbidden coronal iron lines (Fe X) lambda 6374 and (Fe XIV) lambda 5303. The resulting data was compared quantitatively with Einstein images of the same objects, and an attempt was made to determine (a) the process by which ion and electron energies are equilibrated behind the shock front in the ISM and (b) whether cloud evaporation occurs within the hot remnant interiors. Spatially-resolved x-ray emission were modeled for Sedov-Taylor blast wave models of supernovae remnants (SNR) under conditions of non-equilibrium ionization. The computations are intended to provide results that can be directly compared with Einstein high resolution image (HRI) and imaging proportional counter (IPS) data. The computer program for predicting the spatial distribution of HRI and IPS counting rates was completed, and final testing of it had begun.

17037 (N—87-13366) **High energy neutrino absorption and its effects on stars in close x-ray binaries.** Gaisser, T.K.; Stecker, F.W. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Jul 1986. 21p. (NASA-TM—89269; NAS—1.15:89269). NTIS, PC A02/MF A01.

The physics and astrophysics of high energy neutrino production and interactions in close x-ray binary systems are studied. These studies were stimulated by recent observations of ultrahigh energy gamma rays and possibly other ultrahigh energy particles coming from the directions of Cygnus X-3 and other binary systems and possessing the periodicity characteristics of these systems. Systems in which a compact object, such as a neutron star, is a strong source of high energy particles which, in turn, produce photons, neutronos and other secondary particles by interactions in the atmosphere of the companion star were considered. The highest energy neutrinos are absorbed deep in the companion and the associated energy deposition may be large enough to effect its structure or lead to its ultimate disruption. This neutrino heating was evaluated, starting with a detailed numerical calculation of the hadronic cascade induced in the atmosphere of the companion star. For some theoretical models, the resulting energy deposition from neutrino absorption may be so great as to disrupt the companion star over an astronomically small timescale of the order of 10,000 years. Even if the energy deposition is smaller, it may still be high enough to alter the system substantially, perhaps leading to quenching of high energy signals from the source. Given the cosmic ray luminosities required to produce the observed gamma rays from cygnus X-3 and LMX X-4, such a situation may occur in these sources.

17038 (N—87-13367) **Two states of CYG X-1 and related sources.** Kazanas, D. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Jul 1986. 15p. (NASA-TM—89265; NAS—1.15:89265). NTIS, PC A02/MF A01.

A model for active galactic nuclei (AGN), employing quasi-spherical accretion onto a black hole, when scaled down to solar mass objects, provides a straightforward account of the bimodal spectral behavior of Cyg X-1 and the other galactic black hole candidates. It is argued that the change in the spectrum is due to the drastic increase of the source compactness (L/R) with the accretion rate m and the subsequent conversion of most of the energy released by accretion into e(+)e(-) pairs. It is also argued that similar changes may be observed in active galactic nuclei.

17039 (N—87-13368) **Continuum radiation from active galactic nuclei: a statistical study.** Isobe, T.; Feigelson, E.D.; Singh, K.P.; Kembhavi, A. (Pennsylvania State Univ., University Park (USA). Davey Lab.). 1986. 81p. (NASA-CR—179925; NAS—1.26:179925). NTIS, PC A05/MF A01.

The physics of the continuum spectrum of active galactic nuclei (AGNs) was examined using a large data set and rigorous statistical methods. A data base was constructed for 469 objects which include radio selected quasars, optically selected quasars, x-ray selected AGNs, BL Lac objects, and optically unidentified compact radio sources. Each object has measurements of its radio, optical, x-ray core continuum luminosity, though many of them are upper limits. Since many radio sources have extended components, the core component were carefully selected out from the total radio luminosity. With survival analysis statistical methods, which can treat upper limits correctly, these data can yield better statistical results than those previously obtained. A variety of statistical tests are performed, such as the comparison of the luminosity functions in different subsamples and linear regressions of luminosities in different bands. Interpretation of the results leads to the following tentative conclusions: the main emission mechanism of optically selected quasars and x-ray selected AGNs is thermal, while that of BL Lac objects is synchrotron; radio selected quasars may have two different emission mechanisms in the x-ray band; BL Lac objects appear to be special cases of the radio selected quasars; some compact radio sources show the possibility of synchrotron self-Compton (SSC) in the optical band; and the spectral index between the optical and the x-ray bands depends on the optical luminosity.

17040 (N—87-13379) **MAX '91: an advanced payload for the exploration of high energy processes on the active sun.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Jun 1986. 62p. (NASA-TM—89271; NAS—1.15:89271). NTIS, PC A04/MF A01.

The results of a NASA science working group established to study a follow-on to the Solar Maximum Mission are given. A complement of instruments is suggested, with the primary objective of studying the physics of energetic processes in cosmic plasmas by observing high-energy phenomena in solar flares. High-quality flare observations will be possible with these instruments during the next peak in solar activity expected to last from 1990 through at least 1995. The primary objective of MAX '91 is to study energetic processes in cosmic plasmas by observing high-energy phenomena in solar flares. These processes, which are of general astrophysical importance, include energy release, particle acceleration, and energy transport. Results from comprehensive observing programs conducted during the last solar cycle have demonstrated the great scientific potential of high-energy emissions for addressing these central physical processes. Consequently, a payload optimized for observations of high-energy solar flare phenomena is suggested for MAX '91. It consists of the following four specific instruments: (1) a Fourier-transform x-ray and gamma-ray imager covering the energy range from a few keV to 1 MeV with arcsecond spatial resolution; (2) a cooled germanium x-ray and gamma-ray spectrometer with keV spectral resolution covering the energy range from 10 keV to 50 MeV; (3) Bragg spectrometers with high spectral resolution at wavelengths between 1 and 9 angstrons; and (4) a soft x-ray, EUV, or UV imaging instrument with arcsecond spatial resolution.

17041 (N—87-13394) **Gamma-ray spectrometer experiment on the solar maximum mission satellite. Final report, 16 October 1984-15 April 1986.** Chupp, E.L. (New Hampshire Univ., Durham (USA)). Apr 1986. 67p. (NASA-CR—177877; NAS—1.26:177877). NTIS, PC A04/MF A01.

Observations by the Gamma-Ray Spectrometer (GRS) on the Solar Maximum Mission (SMM) are examined. This detector system is sensitive to high-energy x rays, gamma rays, and energetic neutrons. These neutral quanta provide a probe of the highest energy processes in a flare. The GRS has recorded over 150 flares since launch. In addition to the solar discoveries, the SMM GRS has made important discoveries about cosmic gamma sources. These discoveries are summarized.

17042 (N—87-13395) **Neutron and antineutron production in accretion onto compact objects.** Dermer, C.D.; Ramaty, R. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Jul 1986. 16p. (NASA-TM—89264; NAS—1.15:89264). NTIS, PC A02/MF A01.

Nuclear reactions in the hot accretion plasma surrounding a collapsed star are a source of neutrons, primarily through spallation and pion-producing reactions, and antineutrons, principally through the reaction p+p yields p+p+n+anti-n. We calculate spectra of neutrons and antineutrons produced by a variety of nonthermal energetic particle distributions in which the target particles are either at rest or in motion. If only neutral particles are free to escape the interaction site, a component of the proton and antiproton fluxes in the cosmic radiation results from the neutrons and antineutrons which leave the accretion plasma and subsequently decay in the interstellar medium. This additional antiproton component could account for the enhanced flux of antiprotons in the cosmic radiation, compared to values expected from the standard leaky-box model of cosmic-ray propagation and confinement. Moreover, the low-energy antiproton flux measured by Buffington, et al., (1981) could result from target-particle motion in the accretion plasma. This model for the origin of antiprotons predicts a narrow 2.223 MeV line which could be observable.

17043 (NORDITA—84/43-Prepr.) **Frequency dependent polarization in blazars.** Bjoernsson, C.I. (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)). Oct 1984. 38p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750526.

It is argued that the intrinsic frequency dependent polarization in blazars finds its most straight forward explanations in terms of a single rather than a multicomponent sourcemodel. In order to reproduce the observations, under the assumption that the emission mechanism is optically thin synchrotron radiation, both a well ordered magnetic field and an electron distribution with a sharp break or cuttoff are necessary. Non-uniform pitch angle distribution and/or environments where synchrotron losses are important are both conducive to producing strong frequency dependent polarization. Reasons are put forth as to why such conditions are expected to occur in blazars. Two specific models are discussed in detail and it is shown that they are both able to produce strong frequency dependent polarization, even when the spectral index changes by a small amount only.

17044 **(NORDITA—84/44-Prepr.) Solar oscillations.** Christensen-Dalsgaard, J. (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)). 1984. 11p. (CONF-8410299—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750527.

From 4. European meeting on solar physics; Noordwijkerhout, Netherlands (1 Oct 1984).

Observed frequencies of solar oscillations comprise an extensive and accurate set of data related to the structure and dynamics of the solar interior. The physics determining the oscillation frequencies is sufficiently simple that a very detailed comparison between observations and theory is possible. This has provided tight constraints on the structure of the solar interior, as well as measurements of the variation of the solar rotation with depth.

17045 **(NORDITA—85/12-Prepr.) Correlation functions for the clustering of galaxies and Abell clusters.** Jones, B.J.T.; Jones, J.E. (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)). 1985. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750528.

The difference in amplitudes between the galaxy-galaxy correlation function and the correlation function between Abell clusters is a consequence of two facts. Firstly, most Abell clusters with $z<0.08$ lie in a relatively small volume of the sampled space, and secondly, the fraction of galaxies lying in Abell clusters differs considerably inside and outside of this volume. (The Abell clusters are confined to a smaller volume of space than are the galaxies.) We discuss the implications of this interpretation of the clustering correlation functions and present a simple model showing how such a situation may arise quite naturally in standard theories for galaxy formation.

17046 **(NORDITA—85/15-Prepr.) Helioseismology.** Christensen-Dalsgaard, J. (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)). 1985. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750531.

The study of the solar interior structure and dynamics by means of observations of solar oscillations has matured very considerably during the last three years. In 1981 the existence of global solar oscillations had been firmly established, although in most cases the modes of oscillation had not yet been definitely identified. Now a direct determination of the sound speed in a large part of the solar interior has become possible, and the equatorial rotation rate has been measured in most of the sun.

17047 **(NORDITA—85/17-Prepr.) Primordial shear and the question of inflation.** Gonzalez, E.M.; Jones, B.J.T. (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)). May 1985. 26p. Nordisk Inst. for Teoretisk Atomfysik, Copenhagen, Denmark.

Also published in Phys. Lett., B (30 Jan 1986) Vol. 167(1) p. 37-42.

We discuss the role of primordial shear in two inflationary scenarios, Planck-time (Linde) inflation and the GUT inflation. In the Linde picture, including a simple "particle creation" term produces universes in which the temperature rapidly attains a stable asymptotic value just below the Planck temperature, whatever the Higgs field coupling constant. We thus have an extremely isotropic, geometrically flat, high temperature and density "steady state" universe, awaiting a spontaneous phase transition to a "normal" state of matter that permits the standard FRW evolution. In the GUT picture, inflation can occur notwithstanding the presence of anisotropy. However, in these models, initial anisotropy reduces the GUT era coherence length and it becomes more difficult to form the present universe from a single bubble.

17048 **(NORDITA—85/18-Prepr.) Cosmology and galaxy formation. An introduction to some recent ideas.** Jones, B.J.T.; Gonzalez, E.M. (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)). May 1985. 43p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750532.

The aim of the present series of lectures is to be unashamedly pedagogical and present, in simple terms, an overview of our current thinking about our universe and the way in which we believe galaxies have formed.

17049 **(NORDITA—85/19-Prepr.) Early galactic evolution and the nature of the first stars.** Jones, J.E. (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)). May 1985. 56p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87750529.

In this paper, the observational data relating to the early evolution of the Galaxy are reviewed in order to assess the plausibility of a number of models that have been proposed for the first stars. On the basis of standard fragmentation models, it is argued that primordial stars were very similar to normal stars, but that in some circumstances the formation of low mass primordial stars may be suppressed through the dissociation of molecular hydrogen by UV radiation. The existence of these conditions at the time of formation of the Galaxy could explain the absence of zero-metal stars.

17050 **(PB—87-107595/XAB) Solar-Geophysical Data Number 504, August 1986. Part 1 (prompt reports). Data for July 1986, June 1986, and late data.** Coffey, H.E. (National Geophysical Data Center, Boulder, CO (USA)). Aug 1986. 88p. (SGD—504-PT-1). NTIS, PC A05/MF A01.

Contents include: Detailed index for 1985-86; Data for July 1986-(IUWDS alert periods (Advance and worldwide); Solar-activity indices, Solar flares, Solar radio emission, Stanford mean solar magnetic field); Data for June 1986-(Solar-active regions, Solar radio-spectral observations, Cosmic-ray measurements by neutron monitor, Geomagnetic indices, Radio-propagation indices); Late data-(Cosmic-ray measurements by neutron monitor Sep 85 - May 86, Geomagnetic indices).

17051 **(PB—87-107603/XAB) Solar-Geophysical Data Number 504, August 1986. Part 2 (comprehensive reports). Data for February 1986.** Coffey, H.E. (National Geophysical Data Center, Boulder, CO (USA)). Aug 1986. 60p. (SGD—504-PT-2). NTIS, PC A04/MF A01.

Contents include: Detailed index for 1985-86; Data for February 1986-(Meudon carte synoptique, Solar flares, Solar radio bursts at fixed frequencies, Solar x-ray radiation from GOES satellite graphs; Mass ejections from the sun; Active prominences and filaments.

17052 **(PB—87-114252/XAB) Solar-Geophysical Data Number 505, September 1986. Part 1 (prompt reports). Data for August 1986, July 1986, and late data.** Coffey, H.E. (National Geophysical Data Center, Boulder, CO (USA)). Sep 1986. 86p. NTIS, PC A05/MF A01.

Contents include: Detailed index for 1986; Data for March 1986--(Meudon carte synoptique, Solar flares, Solar radio bursts at fixed frequencies, Solar x-ray radiation from GOES satellite, Mass ejections from the sun, Active prominences and filaments); Miscellaneous data--(Interplanetary solar particles and plasma IMP 8 solar protons and alpha particles January 1984-April 1985, Geomagnetic indices May - June 1986).

17054 **(N—87-13375) Upper atmosphere of Venus: a tentative explanation of its rotation.** Boyer, C. Translated from *Astronomie (Paris) ;* 100: 77-83(Feb 1986). 6p. (NASA-TM—88505; NAS—1.15:88505). NTIS, PC A02/MF A01.

The upper atmosphere of Venus seems to revolve every 4 days, while the planet rotates in 243 days. Mariner 10 UV data on the changing positions of dark spots in the upper Venusian clouds have supported estimations of speeds ranging from 120-240 m/s. High rates of acceleration and deceleration occur on the night side, the former between -110 to -90 deg and the latter continuing to -50 deg. Arch and Y formations have been seen repeatedly between -110 to -70 deg. The highest are seen at about -90 deg and the lowest at about -30 deg. The temperature of the cloud layer at 60 km altitude is about 20 C, the pressure is nearly one earth atmosphere, and complex molecules, including O, C, H, N and S and combinations of these are present in abundance.

17055 **Invisible axion detectors.** Sikivie, P. (Univ. of Florida, Gainesville). pp 201-214 of Particles and the universe. Lazarides, G.; Shafi, Q. (eds.). Amsterdam, Netherlands; North-Holland Physics Publishing (1986). (CONF-8506195—). Contract AS05-81ER40008.

From International symposium on particles and the universe; Thessaloniki, Greece (24 Jun 1985).

Axions were first proposed to solve the problem of CP invariance in QCD. Axions are a prime candidate for the constituents of the dark halos of galaxies and galaxy clusters. This paper reviews various ideas for the detection of these invisible axions. After reviewing relevant properties of axions the author describes experiments which would attempt to detect axions in the halo of our galaxy or emitted by the sun or which detect the force mediated by virtual axions.

17056 **Cosmic axion decay to photons in the microwave and infrared regions.** Weiler, T.J. (Vanderbilt Univ., Nashville, TN). pp 215-222 of Particles and the universe. Lazarides, G.; Shafi, Q. (eds.). Amsterdam, Netherlands; North-Holland Physics Publishing (1986). (CONF-8506195—). Contract FG05-85ER40226.

From International symposium on particles and the universe; Thessaloniki, Greece (24 Jun 1985).

The origin and properties of cosmic axions are reviewed. A possible axion contribution to the cosmic photon gas is analyzed in terms of the axion mass, lifetime and number density. Erasure of the axion signature due to early Universe interactions of the decay photons with the electron plasma is discussed. It is concluded that the enhancement of the photon spectrum due to decay of the standard invisible axion is insignificant. A possible photon depletion due to axion formation, and possibly useful bounds on non-standard axions are mentioned.

17058 **(BNL—38963) Atomic physics and synchrotron radiation: The production and accumulation of highly charged ions.** Johnson, B.M.; Meron, M.; Agagu, A.; Jones, K.W. (Brookhaven National Lab., Upton, NY (USA)). 1986. Contract AC02-76CH00016. 21p. (CONF-861114—42). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005250.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

Synchrotron radiation can be used to produce highly-charged ions, and to study photoexcitation and photoionization for ions of virtually any element in the periodic table. To date, with few exceptions, atomic physics studies have been limited to rare gases and a few metal vapors, and to photoexcitation energies in the VUV region of the electromagnetic spectrum. These limitations can now be overcome using photons produced by high-brightness synchrotron storage rings, such as the x-ray ring at the National Synchrotron Light Source (NSLS) at Brookhaven. Furthermore, calculations indicate that irradiation of an ion trap with an intense energetic photon beam will result in a viable source of highly-charged ions that can be given the name PHOBIS: the PHOton Beam Ion Source. Promising results, which encourage the wider systematic use of synchrotron radiation in atomic physics research, have been obtained in recent experiments on VUV photoemission and the production and storage of multiply-charged ions. 26 refs., 4 figs., 1 tab.

17059 **(CEA-CONF—8340) New exact inhomogeneous solutions of the Boltzmann equations.** Cornille, H. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). Nov 1985. 7p. (CONF-8511237—1; SPhT—86-023). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750575.

From 266. R.C.P. meeting on inverse problems; Montpellier, France (27 Nov 1985).

We review recent results obtained for inhomogeneous distributions, solutions of $d > 1$ dimensional non linear Boltzmann equations with both Maxwell particles intermolecular forces and outside forces. We find exact solutions with a structure similar to the homogeneous Bobylev-Krook-Wu distributions. However, on the one hand, unlike the Bobylev inhomogeneous solution which corresponds to a gas in expansion, here these solutions can relax towards absolute Maxwellians. On the other hand, we construct also a class of exact inhomogeneous distributions relaxing towards different oscillating Maxwellians. Two types of external forces are handled: linear spatial forces (mainly harmonic potentials) and linear velocity forces plus uniform source term.

17060 **(CEA-CONF—8454) Population model for nickel-like gold which transitions to discard.** Busquet, M.; Bruneau, J. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Apr 1986. 9p. (CONF-8604224—3). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750444.

From International colloquium on X-ray lasers; Aussois, France (14 Apr 1986).

We have started studies of an extensive population model for gold ionized 49 to 52 times. We shall present in this paper a discussion on the effects of discarding low-rate transitions such as cascades, dielectronic transitions,... Their accounting for, even in a crude way, allow some understanding of typical features of gold spectra.

17061 **(CEA-CONF—8494) Influence of an external electric field on thermal collisions between circular Rydberg-state atoms and ground-state helium.** Prunele, E. de. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). Apr 1986. 3p. (CONF-860435—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750573.

From Atomic and molecular physics conference; Aberdeen, Scotland (8 Apr 1986).

The influence of an external electric field on thermal collisions between a sodium atom excited in a "circular" Rydberg state and a ground-state helium atom is studied numerically within the framework of the impulse approximation. The effect of the field is determined by using parabolic wave functions for the initial and final hydrogenic atomic states. The removal of degeneracy induced by the field appears to have no significant effect for fields in the range of 0-400 V/cm.

17062 **(CEA-CONF—8530) Spectral line shapes of X-ray dipoler emission in high densities plasmas.** Lambert, D. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Jun 1986. 3p. (CONF-8606230—1-Summ.). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750456.

17065 **(CONF-860148—10) Electron ion collisions with a heavy ion cooler ring.** Schuch, R. (Heidelberg Univ. (Germany, F.R.). Physikalisches Inst.). 1986. Contract AC05-84OR21400. 20p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87003001.

From 2. United States/Mexico cooperative symposium on atomic and molecular physics; Cocoyoc, Mexico (8 Jan 1986).

At present several proposals and projects for building heavy ion synchrotron storage rings exist particularly in Europe. They are designed to store, accelerate, and cool heavy ions up to masses of about 240 and energies of about 500 MeV/nucleon. They are injected from existing or to be constructed accelerators. The atomic physics experiments, which are discussed here will take advantage of the electron cooling devices which provide electron-ion-collision facilities with good energy resolutions and large luminosities. The possibilities for measurements of spontaneous and laser-induced radiative recombination and dielectronic recombination in the electron cooling section are discussed.

17066 **(CONF-860845—4) Physical processes at high field strengths.** Rhodes, C.K. (Illinois Univ., Chicago (USA). Dept. of Physics). 1986. Contract AC02-83ER13137. 29p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004732.

From 8. international conference on vacuum ultraviolet radiation physics; Lund, Sweden (4 Aug 1986).

Measurements of the radiation produced by the high field interaction with the rare gases have revealed the presence of both copious harmonic production and fluorescence. The highest harmonic observed was the seventeenth (14.6 rm) in Ne, the shortest wavelength ever produced by that means. Strong fluorescence was seen in Ar, Kr, and Xe with the shortest wavelengths observed being below 10 nm. Furthermore, radiation from inner-shell excited configurations in Xe, specifically the $4d^9 5s5p \rightarrow 4d^{10} 5s$ manifold at ~ 17.7 nm, was detected. The behaviors of the rare gases with respect to multiquantum ionization, harmonic production, and fluorescence were found to be correlated so that the materials fell into two groups, He and Ne in one and Ar, Kr, and Xe in the other. These experimental findings, in alliance with other studies on inner-shell decay processes, give evidence for a role of atomic correlations in a direct nonlinear process of inner-shell excitation. It is expected that an understanding of these high-field processes will enable the generation of stimulated emission in the x-ray range. 59 refs., 6 figs., 5 tabs.

17067 **(CONF-8608108—5) An overview of low-energy ion-atom collisions.** Lin, C.D.; Fritsch, W.; Kimura, M. (Kansas State Univ., Manhattan (USA). Dept. of Physics; Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.); Argonne National Lab., IL (USA); Rice Univ., Houston, TX (USA)). 1986. Contract W-31109-ENG-38. 12p. NTIS MF A01; 2; GPO Dep. File Number DE87004988.

From International seminar on dynamic processes of highly charged ions; Susono, Shizuoka-ken, Japan (21 Aug 1986).

For collisions between multiply charged ions (MCI) and atoms where the energy of the MCI is in the range of 0.1 to 30 keV/amu, it is adequate to treat the motion of the heavy particles classically. The problem is treated by a close-coupling expansion in terms of atomic or/and molecular orbitals with the role of ionization being neglected. 45 refs., 4 figs. (WRF)

17068 **(DOE/ER/10514—T3) Atomic physics of strongly correlated systems: Progress report, 1 August 1984 through 31 July 1985.** Lin, C.D. (Kansas State Univ., Manhattan (USA). Dept. of Physics). Mar 1985. Contract AC02-79ER10514. 7p. NTIS, PC A02. File Number DE87004407.

Brief summaries are given for (1) radial and angular correlations of two excited electrons, (2) triple-center treatment of ionization in p-H collisions, (3) electron capture from hydrogen atoms by bare ions, (4) partial capture cross sections in C^{4+} + H and C^{4+} + Li collisions, (5) the mechanism of K-shell vacancy production in near-symmetric ion-atom collisions, and (6) unified treatment of ion-atom collisions. CAMS activities for 1986 dealt with the following areas: (1) Student Guide to AMO Science; (2) International Survey of Atomic and Molecular Science; (3) Update of the Directory of Atomic, Molecular, and Optical Scientists in the United States; (4) Workshop on VUV and Synchrotron Sources; (5) Study of the State of Atomic, Molecular, and Optical Theory; (6) Workshop on the Laser-Atomic Frontier; (7) Report on Heavy-Ion Storage Rings; (8) Review of Computer Needs in Atomic and Molecular Science.

17070 **(EFI—787(14)-85) Suppression of multiple scattering at planar channeling of negative particles.** Avakyan, H.R.; Beloshitskij, V.V.; Kumakhov, M.A. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700679.

It is shown that at planar channeling of negative particles a considerable portion of the beam undergoes depressed multiple scattering as compared to the case of nonoriented target. This anomaly of multiple scattering is presented up to large depths. 3 refs.; 1 fig.

17071 (GSI—86-31-Prepr.) **Charge transfer in 1.4 MeV/u Ni/sup q+/ -> Kr collisions, q=16-22.** Schoenfeldt, W.A.; Mokler, P.H.; Maor, D. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Aug 1986. 35p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750501.

Cross sections for the electron transfer from neutral Kr atoms to highly charged Ni/sup q+/ projectiles were measured at 1.4 MeV/u collisions. Estimates on the contributions of single and double capture into the Ni-L shell and into excited states are extracted from measured cross sections for the Ni-L X-ray emission at incoming projectile L vacancies (q≧19). We find that most of the capture directly populates the Ni-L shell, in contrast to theoretical predictions for single-electron capture. The involved electrons in double transfer processes seem to be strongly correlated, and the correlation decreases with an increasing number of incoming L vacancies.

17072 (INIS-mf—10556-Vol.1, pp 47-55) **Time of flight experiments of the and H/sup +/ scattered from molecules and solid surfaces.** Toennies, J.P. (Max-Planck-Institut fuer Stroemungsforschung, Goettingen, Germany, F.R.). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Experimental progress in molecular physics is illustrated with emphasis being placed on the study of interactions in three-body and many-body systems. The results are presented of four experiments using the experimental technique of time-of-flight energy loss spectroscopy of atomic or molecular particles at interactions. The experiments are in principle analogous with scattering experiments in nuclear physics. The elastic and inelastic scattering was measured of 20 MeV /sup 4/He atoms by molecules of N/sub 2/, O/sub 2/, CO, CH/sub 4/, and on the surface of noble metals, of proton beams with energy ranging between 10 and 20 eV on a CH/sub 4/ molecular beam, and of HD molecules with energies of up to 30 meV on the surface of gold. Molecular spectroscopic data were obtained with high resolution such as may be compared with model calculations. (S.P.).

17073 (INIS-mf—10556-Vol.1, pp 323-328) **Experimental studies on dissociative charge exchange.** Los, J.; Bruijn, D.P. de. (FOM-Instituut voor Atoom-en Molecuulfysica, Amsterdam, Netherlands). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Transitions to continuum states are discussed focusing on dissociative charge exchange. An experimental method is described which allows detailed measurements on this process. Experiments are shown on the dissociative charge exchange of H/sub 2//sup +/ and on photodissociation of metastable H/sub 2/ formed in charge exchange collisions.

17074 (INIS-mf—10556-Vol.1, pp 329-335) **Dissociation dynamics of van der Waals molecules.** Beswick, J.A. (Laboratoire pour l'Utilisation du Rayonnement Electromagnetique, LURE, Paris-11 Univ., 91 - Orsay, France). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Energy flow patterns of excited van der Waals molecules are reviewed. The most recent techniques to study these molecules rest on the use of supersonic beams and laser excitation. The experiments do not only probe the structure and energy state of the complex but also provide information on the intramolecular energy flow and relaxation. A most interesting feature of excited-state intramolecular dynamics in such systems is the breaking of the weak van der Waals bond. This new class of photochemical fragmentation via internal excitation of van der Waals molecules provides an unambiguous example for vibrational and/or rotational predissociation in molecular physics.

17075 (INIS-mf—10556-Vol.1, pp 336-340) **Dissociative electron attachment.** Hall, R.I. (Paris-6 Univ., 75, France). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Electron-molecule collisions are studied in which molecules dissociate by dissociative attachment of electrons to one of the fragments. The formation of negative ions is a resonant process. Fragment energy distribution and angular distribution of negative ion fragments in collisions with biatomic and triatomic molecules are outlined. The physics is described of the process of dissociative attachment of the electron. (S.P.).

17076 (INIS-mf—10556-Vol.1, pp 341-346) **Rotational energy transfer in molecule-molecule and molecule-surface collisions.** Schinke, R. (Max-Planck-Institut fuer Stroemungsforschung, Goettingen, Germany, F.R.). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Inelastic scattering of molecules in collisions with molecules or surfaces is studied. Attention is devoted to the structure of the differential cross section connected with rotational transitions, the so-called rotational rainbow effect. The relationship is illustrated between the rotational rainbow effect and the interaction potential. A detailed analysis is made of the following examples of collisions: Ne-Na/sub 2/, H/sub 2/-CO, NO-Ag(111), NO-Ar. (S.P.).

17077 (INIS-mf—10556-Vol.1, pp 347-352) **Collisional dynamics of low energy charge transfer processes.** Herman, Z. (Ceskoslovenska Akademie Ved, Prague. Ustav Fyzikalni Chemie a Elektrochemie J. Heyrovskeho). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The study concentrates on asymmetric charge transfer in ion-molecule scattering processes of the type A/sup +/+BC->A+BC/sup +/ and BC/sup +/+A->BC+A/sup +/ at energies in the eV range. Also mentioned are the latest results of the study of single-charge transfer in an atomic system of the type A/sup ++/+B->A/sup +/+B/sup +/. The experimental methods used are presented as are experimental results illustrating each type of collision process. (S.P.).

Berlin, Germany, F.R. Inst. fuer Molekuelphysik). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

17079 (INIS-mf—10556-Vol.1, pp 372-373) **Asymmetric scattering in thermal collisions of alkali (/sup 2/P/sub 3/2/)-atoms with rare gas atoms: Na(3/sup 2/P/sub 3/2/) and K(4/sup 2/P/sub 3/2/) with Ne, Ar and Kr.** Dueren, R.; Hasselbrink, E. (Max-Planck-Institut fuer Stroemungsforschung, Goettingen, Germany, F.R.). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The measurement is discussed of the total differential cross section, i.e., without final state analysis, of the scattering of excited alkali atoms Na(3/sup 2/P/sub 3/2/) and K(4/sup 2/P/sub 3/2/) by rare gas atoms (Ne, Ar, Kr) in crossing atomic beams. A laser beam was used for excitation. The initial states with j,m/sub j/=3/2,+3/2 and 3/2,-3/2 were selected by the choice of circular light polarization. An asymmetry was observed in the scattered intensity. The experimental results are compared with theoretical calculations. (S.P.).

17080 **(IPNO-DRE—85-21) MeV heavy ion induced desorption from insulating films as function of projectile velocity.** Becker, O.; Wien, K.; Della Negra, S.; Le Beyec, Y. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1985. 44p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750732.

The work presented here is focussed on the velocity dependence of the secondary ion yields. The experiments were performed at the ALICE accelerator in Orsay, where primary ion velocities from v=0.2 to 3.0 cm/ns were available, and at a parasitic beam (v<1.6 cm/ns) of the UNILAC-GSI in Darmstadt, where beams up to Uranium could be used. This velocity range covers the most important part of the yield curves and is - as outlined in the following - a critical test for theoretical descriptions.

17081 **(LBL—22282) Ionization and charge transfer in high-energy ion-atom collisions.** Schlachter, A.S.; Berkner, K.H.; Stearns, J.W.; Schmidt-Boecking, H.; Kelbch, S.; Ullrich, J.; Hagmann, S.; Richard, P.; Stockli, M.P.; Graham, W.G. (Lawrence Berkeley Lab., CA (USA); Frankfurt Univ. (Germany, F.R.). Inst. fuer Kernphysik; Kansas State Univ., Manhattan (USA). Dept. of Physics; Ulster Univ., Coleraine (UK). Dept. of Physics; Western Michigan Univ., Kalamazoo (USA). Dept. of Physics; Giessen Univ. (Germany, F.R.). Inst. fuer Kernphysik). Nov 1986. Contract AC03-76SF00098;AC02-83ER13116. 20p. (CONF-861114—37). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003539.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

Electron capture and loss by fast highly charged ions in a gas target, and ionization of the target by passage of the fast projectile beam, are fundamental processes in atomic physics. These processes, along with excitation, can be experimentally studied separately ("singles") or together ("coincidence"). This paper is a review of recent results on singles measurements for electron capture and loss and for target ionization, for velocities which are generally high relative to the active electron, including recent ionization measurements for a nearly relativistic projectile. 11 refs., 6 figs.

17082 **(LBL—22418) Photoionization of atoms and small molecules using synchrotron radiation.** Ferrett, T.A. (California Univ., Berkeley (USA)). Nov 1986. Contract AC03-76SF00098. 269p. NTIS, PC A12/MF A01; 1; GPO Dep. File Number DE87004600.

The combination of synchrotron radiation and time-of-flight electron spectroscopy has been used to study the photoionization dynamics of atoms (Li) and small molecules (SF_6, SiF_4, and SO_2). Partial cross sections and angular distribution asymmetry parameters have been measured for Auger electrons and photoelectrons as functions of photon energy. Emphasis is on the basic understanding of electron correlation and resonant effects as manifested in the photoemission spectra for these systems. 254 refs., 46 figs., 10 tabs.

17083 **(UCRL—95853) Review of progress in the theory of volume production.** Hiskes, J.R. (Lawrence Livermore National Lab., CA (USA)). 24 Oct 1986. Contract W-7405-ENG-48. 14p. (CONF-8610115—10). NTIS, PC A02. File Number DE87004360.

From 4. international symposium on the production and neutralization of negative ions and beams; Upton, NY, USA (27 Oct 1986).

With the demonstration of large current densities extracted from hydrogen-discharge-type negative ion sources there has been a new emphasis directed toward the further development of these volume-type sources. Along with this emphasis has been a rapid increase in our understanding of the underlying atomic processes that occur in hydrogen-negative-ion discharges, together with a rapid evolution of the geometric configuration of these ion sources. An account of the development of the atomic processes in negative hydrogen discharges has been given in a recent review. Here we shall emphasize these atomic developments as they bear on the tandem high-density ion-source configuration. 32 refs., 10 figs.

17084 **Scalar magnetic (e/sup +/e/sup -/) resonance as possible source of an anomalous e/sup +/ peak in heavy-ion collisions.** Wong Cheukyin; Becker, R.L. (Oak Ridge National Lab., TN, USA). *Physics Letters [Section] B;* 182: No. 3/4, 251-255(25 Dec 1986). Contract AC05-84OR21400.

The possibility of (e/sup +/e/sup -/) resonances arising from strong magnetic interactions at short distances is explored as a possible source of the anomalous positron peak in heavy-ion collisions. With a relativistic two-body equation and a model interaction, a scalar /sup 3/P 0/sup ++/ resonance (j=0, 1=1, S=1, P=1 and C=1) with a mass of 1.579 MeV is found. Its two-body decay into an (e/sup +/e/sup -/) pair has a mean life of 4.2 x 10/sup -19/ s and produces a positron and an electron each with a kinetic energy of 279 keV.

17085 **Atomic physics 9.** Van Dyck, R.S. Jr.; Fortson, E.N. (eds.). Singapore, Singapore; World Scientific Publishing Co. Pte. Ltd. (1984). 565p. (CONF-840786—). World Scientific Publishing Co. Pte. Ltd., P.O. Box 128, Farrer Road, Singapore 9128. File Number TI87004225. Contract FG06-84ER13280.

From 9. international conference on atomic physics; Seattle, WA, USA (23 Jul 1984).

Individual papers are catalogued separately. (WRF)

6404 Fluid Physics

17086 **(BARC—1246) Two dimensional analysis for magnetic flux distribution in electromagnet used for MHD applications.** (Bhabha Atomic Research Centre, Bombay (India)). 1984. 27p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701246.

Magnetic flux densities in air and iron region of iron core MHD electromagnet, are calculated based on concept of magnetic vector potential. Numerical solution to the problem is obtained by converting partial differential equations into finite difference form with simplifying assumptions. A computer progrm is developed, giving solution by finite difference method. Over-relaxation technique based on Stoke's theorem is applied. Magnetic induction along the transverse axis of the magnet and plot for magnetic induction lines for current = 2420 A is presented. 9 refs., 7 figures.

17087 **(DOE/ER/72012—T4) CALTECH: DOE program on numerical analysis, computing and fundamental studies in fluid mechanics: Summary report No. 12, April 1, 1986-March 31, 1987.** (California Inst. of Tech., Pasadena (USA)). 1987. Contract AS03-76ER72012. 7p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87004914.

Brief summaries are given for the following areas of research: (1) vortex dynamics and vortical flows, (2) Hele-Shaw fingering, (3) numerical methods for stiff differential equations, (4) pattern formation in solidifying systems, (5) path instability in rising bubbles, (6) multigrid solvers for partial differential equations, and (7) software development. (WRF)

17088 (INIS-mf—10556-Vol.1, pp 133-137) **Astrophysical dynamo.** Ruzmajkin, A.A. (AN SSSR, Moscow. Inst. Prikladnoj Matematiki). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The principle of magnetic field amplification by fluid motion is explained and the slow and fast astrophysical dynamo concepts are discussed, the crucial role of the value of magnetic diffusivity being emphasized. The general kinematic dynamo theorem for random flows is formulated and some of its nonlinear aspects are pointed out. Three important astrophysical applications are briefly mentioned, namely the theory of stellar cycles, magnetic field generation in thin galactic discs, and the structure of accretion discs around black holes in binary star systems. (J.U.).

17089 (INIS-mf—10556-Vol.1, pp 138-143) **Magnetohydrodynamic turbulence.** Pouquet, A. (Observatoire de Nice, 06, France). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Various approaches to the nonlinearities of MHD equations describing the turbulent flow of a conducting fluid are reviewed. The relative strength of nonlinear terms in the MHD equations is measured by kinetic and magnetic Reynolds numbers. In astrophysical flows characterized by very large Reynolds numbers many degrees of freedom are excited, which results in a cascade of excitations from a large to small scale. The restriction of the problem to the case where only a few degrees of freedom are kept, is desirable. Generally, for a full description of various cascades, statistical methods such as closures of renormalization groups and numerical simulation must be applied. (J.U.).

17090 (INIS-mf—10556-Vol.1, pp 123-128) **Magnetoconvection.** Galloway, D.J. (Max-Planck-Institut fuer Physik und Astrophysik, Garching, Germany, F.R. Inst. fuer Astrophysik). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Theoretical attempts to understand the interaction between convection and magnetic fields are summarized, excluding cases where the flow is turbulent or where rotational effects are also important. Theories and computations are grouped into kinematic, Boussinesq, or fully compressible categories, and are contrasted in terms of the amount of physics they contain and of the number of dimensions represented.

17091 (INIS-mf—10556-Vol.1, pp 114-120) **Spin-polarized hydrogen: new limitations on high density.** Silvera, I.F. (Harvard Univ., Cambridge, MA, USA. Dept. of Physics). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The prime goal in the study of spin-polarized hydrogen has been to observe properties of quantum degeneracy in this Bose gas, in particular Bose-Einstein condensation. This requires high densities and/or low temperatures. In four years time, densities have been increased by 4 1/2 orders of magnitude. The techniques, problems and prospects are discussed.

17092 (INIS-mf—10556-Vol.1, pp 101-113) **Quantized vortices in rotating superfluid /sup 3/He.** Krusius, M. (Helsinki Univ. of Technology, Otaniemi, Finland). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

First measurements on quantized vortices in rotating superfluid /sup 3/He have been conducted during the last three years with a rotating nuclear demagnetization cryostat capable of cooling liquid /sup 3/He below 0.5 mK while rotating up to 20 rev/min. The experiments comprised NMR investigations of vortex textures and hydrodynamic measurements on persistent superflow in a toroidal flow channel. A remarkable variety of unexpectd phenomena were discovered which illuminate the structure and topology of quantized vortices in anisotropic superfluids.

17093 **Hamiltonian differencing of fluid dynamics.** Holm, D.D.; Kupershmidt, B.A.; Levermore, C.D. (Los Alamos National Lab., NM). *Advances in Applied Mathematics;* 6: 52-84(1985).

By analyzing the Hamiltonian structures of several representations of continuous Lagrangian fluid dynamics, a universal Hamiltonian form is developed which unifies those structures and applies both to the continuous and spatially discrete cases. Then the universal Hamiltonian form is used as a template for generating numerical differencing schemes which retain the underlying Hamiltonian structure of the continuous theory. Examples are discussed of these spatial differencing schemes for the Euler equations in one, two, and three dimensions. In one dimension, the nondissipative part of the von Neumann-Richtmeyer scheme is recovered as a special case. 33 references.

17094 **(ANL-HEP-CP—86-107) Nucleon decay experiments: status and prospects.** Ayres, D.S.; Beier, E.W.; D'Ettorre Piazzoli, B.; Ernwein, J.; Gaisser, T.K.; Seidel, S.; Sulak, L.R. (Argonne National Lab., IL (USA); Pennsylvania Univ., Philadelphia (USA); Turin Univ. (Italy); CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France); Bartol Research Foundation of the Franklin Inst., Newark, DE (USA); Michigan Univ., Ann Arbor (USA)). 1986. Contract W-31109-ENG-38. 8p. (CONF-8606215—10). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87001561.

From Summer study on the physics of the superconducting super collider ↑; 0.

We survey the current status and future prospects of experiments to search for nucleon decay. Results from current experiments are summarized, and the background rejection capabilities of various techniques are described. We discuss the prospects for improved sensitivity in the new experiments that are now coming into operation, and the opportunities for the next generation of detectors. 33 refs., 2 figs., 4 tabs.

17095 **(ANL-HEP-CP—86-133) Properties of gluon jets.** Sugano, K. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31-109-ENG-38. 63p. (CONF-860943—2). NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87004842.

From 6. physics in collision; Chicago, IL, USA (3 Sep 1986).

The properties of gluon jets are reviewed from an experimental point of view. The measured characteristics are compared to theoretical expectations. Although neither data nor models for the gluon jets are in the mature stage, there are remarkable agreements and also intriguing disagreements between experiment and theory. Since much interesting data have begun to emerge from various experiments and the properties of gluon jets are deeply rooted in the basic structure of non-Abelian gauge theory, the study of gluon jets casts further light on our understanding of QCD. Finally, the future prospects are discussed.

17096 **(BNL—39168) Experimental results on spin physics at the AGS.** Makdisi, Y.I. (Brookhaven National Lab., Upton, NY (USA)). 1986. Contract AC02-76CH00016. 6p. (CONF-8609151—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005257.

From 7. international symposium on high energy spin physics; Protvino, USSR (22 Sep 1986).

The AGS ran with polarized protons towards the end of 1985 and through the first two months of 1986. This comprised commissioning periods interleaved with two runs for physics at 13.5 GeV/c with beam polarization of 50 to 60%, and 18.5 GeV/c with an average beam polarization of 40%. Later, the AGS polarized beam reached peak energy of 22 GeV/c and polarization of 46%. This article describes the various spin related experimental efforts since the VI Symposium at Marseille. These will be grouped into those using unpolarized beams and the rest are the polarized proton beam users. Afterwards the future of the program is described as extensions of current experiments in addition to other measurements that are yet to be proposed.

17097 (CERN—86-07) Evolution of weak interactions. Lee, T.D. (European Organization for Nuclear Research, Geneva (Switzerland)). 16 Sep 1986. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700668.

Talk given at the symposium dedicated to Jack Steinberger, at CERN, 16 May 1986.

A history of the study of weak interactions is presented, together with some personal recollections of the important contributions made by Jack Steinberger.

17098 (DOE/ER/03244—134) Hyperon-antihyperon production studies near threshold at LEAR. Hamann, N. (Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Physics; Freiburg Univ. (Germany, F.R.). Fakultaet fuer Physik). 1985. Contract AC02-76ER03244. 6p. (CONF-8506162—5). NTIS, PC A02. File Number DE87003929.

From Symposium on medium energy nucleon and antinucleon scattering; Bad Honnef, F.R. Germany (18 Jun 1985).

Aspects of proton-antiproton interactions above the threshold for lambda-antilambda production are studied at LEAR. Measured quantities include total and differential cross sections as well as final state polarizations and hyperon-antihyperon spin correlations for this reaction at 1508 and 1477 MeV/c antiproton beam momentum.

17099 (DOE/ER/10690—7) Participation in the ARGUS experiment at the DORIS Collider at Desy, Hamburg, Germany and participation in the AMY experiment at the TRISTAN Collider in Tsukuba, Japan: 1986 progress report. Darden, C. (South Carolina Univ., Columbia (USA). Dept. of Physics and Astronomy). Jan 1987. Contract AS09-80ER10690. 11p. NTIS, PC A02. File Number DE87005171.

Progress is reported on the AMY and ARGUS detectors, as well as plans for the next funding period. The AMY detector is reported as well on the way to completion, but not yet ready to take data. The ARGUS detector is reported to have completed its fourth year of operation. Some upsilon 1S decay data are discussed. 37 refs. (LEW)

17100 (DOE/ER/40257—001) Non-accelerator particle physics: Progress report for period February 1, 1986-January 31, 1987. Steinberg, R.I. (Drexel Univ., Philadelphia, PA (USA). Dept. of Physics and Atmospheric Science). Jan 1987. Contract AC02-86ER40257. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004418.

The goals of this research are the experimental testing of fundamental theories of physics such as grand unification and the exploration of cosmic phenomena through the techniques of particle physics. We are currently participating in construction of the MACRO detector, an underground instrument which will have an acceptance of 12,000 m^2sr, and which will attempt to perform a definitive search for magnetic monopoles using excitation-ionization methods. Other major objectives of the MARCO experiment will be to search for astrophysical high energy neutrinos expected to be emitted by such objects as Vela X-1 and LMC X-4 and to search for low energy neutrino bursts from gravitational stellar collapse. We have developed a high transparency liquid scintillator suitable for use in the 12-meter-long MACRO detector boxes. We are also currently engaged in: (1) further improving the performance of this scintillator in order to maximize the sensitivity of the MACRO detector to lightly ionizing particles and to further improve the stability and transparency of the scintillator; (2) preparing the techniques necessary for full scale production of the 750 tons of liquid scintillator needed for MACRO; (3) planning and development of the on-line data acquisition system and off-line data analysis for MACRO.

17101 (EFI—782(9)-85) Measurement of the polarization of cumulative protons in γA -> pX reaction. Avakyan, R.O.; Avakyan, E.O.; Avetisyan, A.Eh. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700677.

The polarization of cumulative protons in γA -> px reaction is measured in the range of proton energy (190 + 270) MeV for C, Cu, Sn, Pb nuclei. The measured polarization is practically independent of the energy of protons and the atomic number of nuclei. 11 refs.; 4 figs.; 1 tab.

17102 (EFI—796(23)-85) On the growth of hadronic photoabsorption cross-section. Bayatyan, G.L.; Margaryan, A.J. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700686.

Energy dependence of total hadronic photoabsorption cross section is discussed in connection with the hypothesis about gluonic nature of cross-section growth. 6 refs.; 1 fig.

17103 (IFVE-OEF—85-32) Experiment to study the gluon interactions and glueball production in the central region of hadron collisions at UNK energies (2-3 TEV). Prokoshkin, Yu.D. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700710.

The experiment in the UNK beam (2-3 TeV) is discussed in which glueballs are separated from the background of quark meson states. The glueball signal is enchanced both in the production reaction (in the central collision region, Xsub(F), where Xsub(F) is the Feynman variable) and in the decay process (into pseudoscalar mesons and further on into photons, including (gg)->P/sub 1/P/sub 2/->kγ, 4 <= k <= 20). The main features of the experimental set-up are considered as well as the pecularities of detecting multiphoton states which are produced in glueball decays with the help of the hodoscope spectrometer GAMS. 23 refs.; 11 figs.

17104 (IFVE-OEIPK—85-108) Study on the K/sup +/p -> Λ + p + X reaction at 32 GeV/c. Azhinenko, I.V.; Kurnosenko, A.I.; Uvarov, V.A.; Shlyapnikov, P.V.; Garuchava, Z.Sh.; Shoshiashvili, Sh.S.; Vol'f, E.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700714.

Submitted to the journal Sov. J. Nucl. Phys. .

Experimental data are presented on inclusive production of the Λ hyperons and slow protons (with psub(LAB) < 1,2 GeV/c) in the K/sup +/p -> Λ + p + X reaction at 32 GeV/c. 13 refs.; 3 figs.; 2 tabs.

17105 (IFVE-ONF—85-107) Study on the inclusive neutrino (antineutrino) interactions with nuclei at 3-30 GeV. Ammosov, V.V.; Baranov, D.S.; Bugorskij, A.P. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 16p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700719.

Submitted to the journal Zeit. Phys. C.

The results on studying inclusive ν(anti ν)A charged current interactions obtained in the SCAT bubble chamber experiment are presented. The differential cross sections and nucleon structure function have been analyzed. The results are compared with QCD and predictions. 25 refs.; 8 figs.; 1 tab.

17106 (INIS-mf—10556-Vol.1, pp 217-222) Solar neutrino experiments. Hampel, W. (Max-Planck-Institut fuer Kernphysik, Heidelberg, Germany, F.R.). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The current status of solar neutrino research is reviewed. Updated results from the Brookhaven Chlorine Experiment are presented and compared with the expectation from the Standard Solar Model. The present status of the Gallium Experiment is described and the response of this detector to different possible explanations for the discrepancy resulting from the Cl experiment is discussed. The status is reported of some of the other solar neutrino detectors on which work is in progress.

17107 (INIS-mf—10556-Vol.1, pp 229) **Lepton number non-conservation and double beta decay.** Fiorini, E. (Milan Univ., Italy. Ist. di Fisica). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

17108 (INIS-mf—10556-Vol.1, pp 230-235) **Beam dump neutrino experiments.** Perez, P. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette, France). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The results are presented of beam dump neutrino experiments carried out in CERN and FNAL. The values are presented of the ratios ν-bar/sub μ//ν/sub μ/ and (ν/sub e/+ν-bar/sub e/)/(ν/sub μ/+ν-bar/sub μ/). The beam dump neutrino experiments have established a new source of neutrinos. They are also a tool for searching new classes of particles kindly offered by the theorists. (Z.J.).

17109 (INIS-mf—10556-Vol.1, pp 236-245) **Neutrino physics at future colliders.** Rujula De, A. (European Organization for Nuclear Research, Geneva, Switzerland). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The prospects are assessed of neutrino physics at future colliders, namely at the American SCS and the European LHC. The main characteristics (total flux and average energy) are derived of prompt lepton beams and the expected event rates at a hypothetical standard detector are computed. The neutrino beams are compared produced in the collider mode with the neutrino beams from a beam dump and with future ep facilities. An estimate is made of charm production cross sections at TeV energies. (Z.J.).

17110 (INIS-mf—10556-Vol.1, pp 291-298) **Jets in e/sup +/-e/sup -/ collisions.** Haissinski, J. (Paris-11 Univ., 91 - Orsay, France. Lab. de l'Accelerateur Lineaire). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

It is pointed out that hadron jets observed in e/sup +/-e/sup -/collisions have a deep origin. They reveal the emission of energetic primary partons and subsequent confinement effects which prevent colour charges from separating at large distances. The study of these jets has allowed the determination of some important parton properties such as the spin. All observations concerning jet morphology and the event shape evolution with CMS energy are well described by perturbation quantum chromodynamics. (Z.J.).

17111 (INIS-mf—10556-Vol.1, pp 309-315) **Quarkonia.** Conforto, G. (INFN, Firenze, Italy). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The term quarkonium indicates the system formed by a quark and its antiquark. The study of quarkonia aims at a comprehensive understanding of the interquark force. The processes of formation, cascade decays and annihilations of quarkonia are investigated. (Z.J.).

17112 **(INS-TEC—22) Data compilation of single pion photoproduction below 2 GeV.** (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study). 5 Sep 1985. 105p. NTIS (US Sales Only), PC A06/MF A01. File Number DE87701316.

An updated data compilation on single pion photoproduction experiments below 2 GeV is presented. This compilation is mainly purposed to use the determination of photocoupling of the nucleon resonances. This data bank includes not only the data of single pion photoproduction from nucleon and deuteron but also the proton Compton scattering (γp -> γp) and the inverse process of the γn -> π/sup -/p (π/sup -/p -> γn). More than 8 experiments are performed from the previous publication. In this publication, 20 experiments for coherent π/sup 0/ production off deuteron are newly presented. The INS computer is replaced to FACOM M-300 series at November 1984. The compiled data are stored on the INS central computer (FACOM M-380) for direct use of this data bank and on a magnetic tape with the standard label for other laboratories. The FACOM computer is compatible with an IBM 370-series or IBM 303X- or 308X-series machines. Then the compiled data are able to use at any laboratories having an IBM or an IBM compatible machines. The data on the magnetic tape are available on request.

17113 **(INS-TH—161) Data compilation of single pion photoproduction below 2 GeV.** (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study). Sep 1984. 69p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87701317.

An updated data compilation on single pion photoproduction experiment below 2 GeV is presented. This data bank includes not only the data of single pion photoproduction processes but also those of the proton Compton scattering (γp -> γp) and the inverse process of the γn -> π/sup -/p (π/sup -/p -> γn). The number of total data points are 6240 for γp -> π/sup +/n, 5715 for γp -> π/sup 0/p, 2835 for γn -> π/sup -/p, 177 for γn -> π/sup 0/n, 669 for γp -> γp, and 112 for π/sup -/p -> γn processes. The compiled data are stored in the central computer (FACOM M-380R) of the Institute of Nuclear Study, University of Tokyo, for direct use of this data bank and on magnetic tapes with the standard label for other laboratories. The FACOM computer is compatible with an IBM 370 series or IBM 303X or 308X series machines. The data on the magnetic tapes are available on request. (Kato, T.).

17114 **(ITEP—115(1985)) Experimental comparison of EMC effect in the anti νn and anti νp interactions in neon nucleus.** Asratyan, A.E.; Efremenko, V.I.; Fedotov, A.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 28p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701322.

In the framework of the method used to separate the antiν and antiνp interactions in the neon nucleus, a strong distinction of the quantity Rsub(Ne)(x)=(dσsup(antiνn)/dx)/(dσsup(antiνp)/dx) measured in this anti νNe experiment from the analogous quantity Rsub(D)(x) obtained earlier in a deuterium experimentis found. This difference can be attributed to the difference between the magnitudes of the EMC effect in the anti νn and anti νp scattering. 14 refs.; 2 figs.

17115 **(ITEP—187(1984)) Anti νn and anti νp interactions in neon nucleus: total cross section ratio and quark-parton analysis.** Asratyan, A.E.; Efremenko, V.I.; Fedotov, A.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1984. 45p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701323.

About 7 thousand events of the charged-current anti νn and anti νp scattering in the neon nuclei at the antineutrino energies 10 - 20 GeV are studied in the experiment with the Fermilab 15-ft. bubble chamber. the total cross section ratio Rsigmasub(antiν)sigmasub(antiνp) is independent of the energy and is equal to R=0.48 +- 0.03(+0.03-0.00) on the average. Extracted in the framework of the quark parton model are the momentum distributions xu(x), xd(x), x[anti u(x) + anti s(x)], x[anti d(x) + anti s(x)] of the (anti)-quarks in the bound proton. The results are compared with the free nucleon data from deuterium and hydrogen experiments. 28 refs.; 8 figs.

17116 **(JINR-R—1-85-220) Λ hyperon and K/sup 0/ meson production in Cp and CC interactions at 4.2 GeV/c per nucleon.** Armutlijskij, D.A.; Bogdanovich, E.; Gasparyan, A.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1985. 13p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700788.

Submitted to the journal Sov. J. Nucl. Phys. .

This paper is devoted to the production of Λ hyperons and Ksub(s)sup(0)-mesons in Cp, CC interactions and CC multinucleon interactions. The mean multiplicities and also inclusive cross sections of Λ- and Ksub(s)sup(0)-production in the interactions under study have been determined. On the average a larger multiplicity of charged particles is observed in CC-interactions with the production of Λ- and K-particles as compared to all inelastic CC-interactions: <nsub(+-)>Λ, K/sup 0/ approximately 1.3 < nsub(+-) >sub(CC)sup(in). Such an effect is not discovered for multinucleon CC-interactions. The momentum and angular distributions for Λ- and Ksub(s)sup(0)-particles are presented. 16 refs.; 9 figs.; 6 tabs.

17117 **(JINR-R—1-85-854) Analysis of elastic scattering in anti pp interactions at 22.4 GeV/c.** Batyunya, E.V.; Boguslavskij, I.V.; Bruntsko, D. (Joint Inst. for Nuclear Research, Dubna (USSR)). 1985. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700791.

Results are presented on measuring the anti pp elastic scattering differential cross section at 22.4 GeV/c over a region of 0.05 < chemical bondtchemical bond < 0.95 GeV/sup 2/. The results have been obtained from pictures of the HBC "Ludmila". The total elastic cross section σsub(el)=9.0 +- 0.3 mb and the slope parameter b(s, t=0)=13.1 +- 0.8 GeVsup(-2) have been found from the data approximated by a quadratic exponential function. The results are compared with the data at similar energies. 23 refs.

17118 **(JINR-R—1-85-948) A-dependence of production cross section of the Nsub(PHI) narrow baryon resonance.** Aleev, A.N.; Aref'ev, V.A.; Balandin, V.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1985. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700792.

Submitted to the journal Sov. J. Nucl. Phys. .

A narrow baryon resonance Nsub(PHI) decaying into Σ/sup -/(1385)K/sup +/ has been detected in an experiment performed by means of B1S spectrometer in a neutron beam of the Serpukhov accelerator. Multichannel threshold gas Cherenkov counters, being a part of the spectrometer composition, were used for positively charged kaon identification in resonance selection. The spectrometer exposition in neutron beam was performed at 3 targets (carbon, aluminium and copper). This allowed one to determine A-dependence of Nsub(PHI) production cross section, which is described by a power law sigma approximately Asup(α), at α=(0.6 +- 0.3). Nsub(PHI) production cross section times the branching ratio over the observed channel is equal to (0.26 +- 0.20) μb per nucleon. 9 refs.; 7 figs.; 1 tab.

17119 **(NBI-HE—84-42) Fragmentation of jets produced in hard p anti p collisions at the ISR.** Botner, O. (Niels Bohr Inst., Copenhagen (Denmark)). 16 Aug 1984. 11p. (CONF-840757—39). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750534.

From 22. international conference on high energy physics; Leipzig, German D.R. (19 Jul 1984).

Among the highlights at the 21. ICHEP in Paris (1982) were results from the ISR and the CERN p anti p collider showing the emergence of jets in events triggered on large transverse energy (ET) deposition in a calorimeter. Measurements of the inclusive jet cross-sections and studies of event properties followed, both at ISR energies (√s=45 and 63 GeV) and at the collider, √s=540 GeV. Having proven that jets dominate the event structure at sufficiently high ET, the AFS collaboration has used a 2-JET trigger, requiring large ET in two non-overlapping regions of the calorimeter, to enhance the sample of jet events. In the following we present an analysis of jet fragmentation properties based on this data sample.

17120 **(TRI-PP—86-104) Review of results from TRIUMF.** Kitching, P. (TRIUMF, Vancouver, British Columbia (Canada)). Oct 1986. 5p. NTIS (US Sales Only), PC A02. File Number DE87900324.

The high energy physics experiments at TRIUMF are briefly discussed, including: measurement of charge symmetry breaking in the n-p system; test of time reversal invariance in the p-p system; measurement of R/sub t//D/sub t/ in n-p scattering; measurement of cross sections and A/sub y/ for interactions of polarized protons and neutrons; pion-deuteron elastic scattering; and planned experiments with an optically pumped polarized ion source. (LEW)

17121 **Study of gluon scattering and gluon fragmentation in high P/sub T/ interactions at the ISR.** Breakstone, A.; Crawley, H.B.; Firestone, A.; Gorbics, M.; Isenhower, D.; Lamsa, J.W.; Meyer, W.T.; Campanini, R.; Cuffiani, M.; Deninno, M.M. (Ames Lab., IA, USA; Iowa State Univ. of Science and Technology, Ames, USA. Dept. of Physics). *Zeitschrift fuer Physik [Sektion] C: Particles and Fields;* 33: No. 4, 475-481(Feb 1987). Contract W-7405-ENG-82;AC03-76SF00098.

Gluon scattering processes are studied in hadronic high p/sub T/ events using data obtained with the Split Field Magnet detector (SFM) at the CERN ISR. The experimental set-up allowed the scanning of a wide range of parton energies and scattering angles. It is shown that for positive pions as trigger particles, the parton composition of the recoil jet is correlated with the polar angle and transverse momentum of the triggering pion. Over the kinematical region studied, the recoil jet originates predominantly from scattered gluons, with an increasing prevalence of the gluon component towards forward triggering angles. The variation of the momentum structure of the recoil jet with the trigger angle indicates that the fragmentation function of gluons is softer than that of quarks.

17122 **Production of activation products in space-craft components by protons in low earth orbit.** Normand, E.; Johnson, M.L. (Boeing Aerospace). *Transactions of the American Nuclear Society;* 53: 412-413(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

A spacecraft orbiting the Earth through trapped radiation belts will be subject to an induced effect as well as to the direct irradiation by the protons and electrons of the trapped belts. This induced effect is activation of the spacecraft materials by the trapped belt protons. This activation will produce many radioisotopes having half-lives ranging from seconds to millions of years, and emitting various types of radiation. Of primary concern are radioisotopes that emit gamma rays and have half-lives of several years or less. Cross-section data sets are currently being compiled for proton-induced activation products by the Los Alamos National Laboratory. Despite uncertainties in cross-section data, it is instructive to illustrate the magnitude of activation levels and the resulting dose rates calculated in an approximate manner. A number of simplifying assumptions are made.

17123 **(ANL-HEP-CP—86-130) Tests of QCD in high energy spin reactions.** Lipkin, H.J. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 16p. (CONF-8609151—4). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004841.

From 7. international symposium on high energy spin physics; Protvino, USSR (22 Sep 1986).

Spin physics in the quark model is discussed, starting with the prediction of the ratio of the proton and neutron magnetic moments. Other experimental tests of the spin-isospin structure of baryon wave functions are considered, including interactions of pions on polarized protons involving spin flip. Also considered are polarization experiments in nucleon-nucleon scattering to test the different mechanisms suggested by QCD for high transverse momentum transfer in hadron-hadron scattering. (LEW)

17124 **(ANL-HEP-CP—86-134) Bottom quark production at the SSC [Superconducting Super Collider].** Berger, E.L.; Collins, J.C.; Soper, D.E. (Argonne National Lab., IL (USA); Illinois Inst. of Tech., Chicago (USA). Dept. of Physics; Oregon Univ., Eugene (USA). Inst. of Theoretical Physics). 8 Dec 1986. Contract W-31-109-ENG-38. 12p. (CONF-8606215—31). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004967.

From Summer study on the physics of the superconducting super collider ↑; ().

We present predictions for the rapidity and transverse momentum distributions for inclusive production of bottom quarks at SSC energies, pp → bX. Our computations are based on the simplest, lowest-order QCD mechanisms. To estimate uncertainties, we use three different choices for structure functions, G(x,Q), as well as different choices for the evolution scale Q.

17125 **(BARC—1260) Heavy ion collisions, the quark-gluon plasma and antinucleon annihilation.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 49p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701253.

Studies in high energy physics have indicated that nucleon and mesons are composed of quarks confined in bags by the strong colours mediated by gluons. It is reasonably expected that at suitably high baryon density and temperature of the nucleus, these bags of nucleon and mesons fuse into a big bag of quarks or gluons i.e. hadronic matter undergoes transition to a quark-gluon phase. Two techniques to achieve this transition in a laboratory are: (1) collision of two heavy nuclei, and (2) annihilation of antinucleons and antinuclei in nuclear matter. Theoretical studies as well as experimental studies associated with the transition to quark-gluon phase are reviewed. 51 refs., 12 figures, 3 tables.

17126 **(BNL—39062) The fifth force.** Fischbach, E.; Sudarsky, D.; Szafer, A.; Talmadge, C.; Aronson, S.H. (Purdue Univ., Lafayette, IN (USA). Dept. of Physics; Washington Univ., Seattle (USA). Dept. of Physics; Brookhaven National Lab., Upton, NY (USA); European Organization for Nuclear Research, Geneva (Switzerland)). 1986. Contract AC02-76CH00016. 12p. (CONF-860701—70). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004612.

From 23. international conference on high-energy physics; Berkeley, CA, USA (16 Jul 1986).

We present a phenomenological description of the "fifth force" which focuses on the implications of the existing data from satellite and geophysical measurements of gravity, the Eoetvoes experiment, decays into hyperphotons, and the energy-dependence of the K^0 - anti K^0 parameters.

17127 **(CEA-CONF—8466) On short-range rapidity fluctuations in high energy collisions.** Pechanski, R. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). Mar 1986. 6p. (CONF-8603119—14). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750574.

From 21. Rencontre de Moriond: strong interactions and gauge theories conference; Les Arcs, France (16 Mar 1986).

Factorial rapidity moments of high energy collisions are shown to select short-range fluctuations of non-statistical origin. The observation of a power-law behaviour of these moments as a function of the rapidity resolution would give a clear signal of an expanding quark-gluon plasma.

17128 **(CEA-N—2479) Survey of research in elementary particle physics.** Baton, J.P.; Cohen-Tannoudji, G. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). May 1986. 170p. (In French). NTIS (US Sales Only), PC A08/MF A01. File Number DE87750537.

These notes are devoted to the current trends in elementary particle physics. They are not intended for the training of experts in the field. After a brief historical survey, one discusses the difficulties which have made necessary to move from classical physics to relativistic quantum physics. The main concepts of this new theory are rapidly presented. The experimental methods are discussed within a few typical experiments, already performed or scheduled. The main questions which are still unsolved are rapidly mentioned.

17129 **(EFI—811(38)-85) On the question of Higgs boson production in heavy quarkonium decays.** Alanakyan, R.A.; Grigoryan, S.G.; Matinyan, S.G. (Erevanskij Fizicheskij Inst. (USSR)). 1985. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700689.

The mechanism of production of H/sup 0/-boson in hadronic decays of the heavy eta(/sup 1/S/sub 0/)-quarkonium is studied. It is shown that the probability of production of a light Higgs boson (with msub(H) < 10 GeV) in the hadronic decay of quarkonium is higher than in radiative decays, while for msub(H) in 10-30 GeV range the probabilities of these decays are comparable. The differential characteristics of the H/sup 0/-boson in the mechanism under consideration are studied. 13 refs.; 3 figs.; 2 tabs.

17130 **(IFVE-OTF—85-30) Model of nonrelativistic quarks in self-consistent field.** Bornyakov, V.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700724.

The quasiclassical limit of the model, which describes the nonrelativistic quark interaction with a scalar field, is investigated. The static properties of proton in such a model have been calculated. 11 refs.; 3 figs.

17131 **(IFVE-OTF—85-71) Leptoproduction of nuclei as an analogue to production in hadron-hadron interactions (at the example of J/psi).** Batunin, A.V.; Smirnov, A.Yu. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 7p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700727.

Submitted to the journal Sov. J. Nucl. Phys. .

The role of states with hidden colour inside a nucleus in leptoproduction processes (at the example of J/psi-meson) production is investigated. A concrete production mechanism is proposed, appealing to the dual parton model of hadron-hadron interactions. Comparison with experiment is made. 8 refs.; 4 figs.

17132 **(INIS-mf—10252) Heavy flavour decays and the structure of weak interactions.** Bigi, I. (Technische Hochschule Aachen (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet). 20 Jun 1984. 66p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87750516.

The so-called Standard Model has been developed describing the electro-weak interactions by an SU(2)/sub L/xU(1) gauge theory the community's almost unanimous choice of the candidate theory for the strong interactions is QCD based on an SU(3) gauge theory. It is very instructive to recall the similarities and differences of these two theoretical frameworks. Both are based on non-abelian gauge theories with spin -1/2 matter fields and spin -1 radiation fields the latter being the carriers of the forces. Beyond this basic correspondence there are however crucial differences which I sketch under the headings "computational tools" and "predictive power"; there exist of course correlations between these two items. (orig./HSI).

17133 **(INIS-mf—10318) Nucleon-nucleon scattering in a nonrelativistic quark model.** Burger, J. (Erlangen-Nuernberg Univ., Erlangen (Germany, F.R.). Naturwissenschaftliche Fakultaet 1 - Mathematik und Physik). 22 Jul 1985. 155p. (In German). NTIS (US Sales Only), PC A08/MF A01. File Number DE87750515.

The aim of the present thesis is to understand the nucleon-nucleon interaction starting from a nonrelativistic quark model. In the framework of a quark model first a classification of 3q and 6q states is given which serve as basis for the calculations on the nucleon-nucleon scattering performed by means of the refined resonating-group method. For the comparison the results for the s-, p-, and d-phases are confronted to the results of conventional calculations in the meson-exchange picture (Bonn potential) on the rho + ω exchange. Additionally to the one-gluon exchange potential phe-

nomenological potentials are regarded in the calculations which make a comparison with experimentally determined nucleon-nucleon scattering phases possible.

17134 (INIS-mf—10556-Vol.1, pp 212-216) **Neutrino oscillations.** Sobel, H.W. (California Univ., Irvine, USA. Dept. of Physics). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Current theories for unification of the weak, electromagnetic and strong interactions require neither massless neutrinos or exact lepton number conservation. If neutrinos are massive the weak interaction eigenstates can be thought of as linear combinations of neutrino mass eigenstates. The search for neutrino oscillations provides limits on the mass difference between eigenstates, and the mixing angle. The current experimental limits are presented.

17135 (INIS-mf—10556-Vol.1, pp 299-308) **Electroweak interactions and new particle searches.** Marshall, R. (Rutherford Appleton Lab., Chilton, UK). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

A comparison is made of experimental data of the process e/sup +/e/sup -/->μ/sup +/μ/sup -/ with theoretical data ensuing from the electroweak theory. It is shown that the standard model of Glashow, Weinberg and Salam satisfactorily describes the electroweak interactions of leptons and quarks down to distances as small as 5x10/sup -3/ fm. The question of the substructure of quarks and leptons is also discussed. (Z.J.).

17136 (INIS-mf—10556-Vol.1, pp 259-273) **High transverse-momentum jets.** Lella Di, L. (European Organization for Nuclear Research, Geneva, Switzerland). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The production is dealt with of particles with high transverse momentum in collisions between protons and antiprotons. The interpretation is presented within the parton model and quantum chromodynamics, of experimentally observed high transverse momentum jets. Attention is focused on inclusive jet yield, angular distribution of parton-parton scattering, determination of the proton structure function, on the total transverse momentum of the two-jet system, jet fragmentation, charged-particle multiplicity in jets, energy flow around the jet axis, and two-jet invariant mass distribution. (Z.J.).

17137 (INIS-mf—10556-Vol.1, pp 275-281) **Hadronic production of leptons and photons.** McCubbin, N.A. (Rutherford Appleton Lab., Chilton, UK). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Although hadronic collisions produce direct leptons and photons much less copiously than hadrons, these leptons and photons are invaluable for probing hadronic structure and interactions. Roughly speaking, "deep inelastic" production of leptons and photons is reasonably well understood, but the production of "soft" leptons and photons is not. Aspects of both "deep inelastic" and "soft" production are discussed.

17138 (INIS-mf—10556-Vol.1, pp 282-287) **QCD and hard quark and gluon scattering.** Webber, B.R. (Cambridge Univ., UK. Cavendish Lab.). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Given the quark and gluon structure functions of the colliding hadrons at a single energy scale, quantum chromodynamics predicts the cross sections and angular distributions for the production of hadronic jets and lepton pairs at all large momentum transfers. The theory also makes predictions about the fragmentation of quark and gluon jets into hadrons. Recent developments in the comparison between theory and experiment are reviewed and some expectations for higher energies are presented.

17139 (INIS-mf—10556-Vol.1, pp 316-319) **New directions in high energy physics.** Peccei, R.D. (Max-Planck-Institut fuer Physik und Astrophysik, Muenchen, Germany, F.R.). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Prospects for new discoveries in the next generation of colliding beam machines are discussed. Suggestions for the substructure of quarks and leptons, as well as for the presence of bosonic partners of these particles are examined.

17140 (INIS-mf—10556-Vol.2) **Trends in physics 1984. Proceedings of the 6th general conference of the European Physical Society. Volume 2.** Janta, J.; Pantoflicek, J. (eds.). (Jednota Ceskoslovenskych Matematiku a Fyziku, Prague). 1984. 15p. (CONF-8408138—Vol.2). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700738.

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The second volume of conference proceedings contains 56 papers in the following fields: phase diagram and structure of coulomb fluids; lattice calculations in condensed matter and paticle physics; localisation and disorder in two-dimensional electron systems; new methods for surface physics; total energy and dielectric properties of semiconductors; organic superconductors; electronic properties of polymers and applications; sensor research and technology; teaching physics for understanding or application; public awareness of physics; a catastrophic view of planet Earth; physics and agriculture. Three documents were inputted in INIS dealing with hadron spectroscopy using the Monte Carlo method in lattice gauge theory, with surface studies by sputtering and with ice ages. (M.D.).

17141 (INIS-mf—10556-Vol.2, pp 409) **Hadron spectroscopy using Monte Carlo technique in lattice gauge theory.** Martinelli, G. (Istituto Nazionale di Fisica Nucleare, Frascati, Italy. Lab. From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

17142 (IPNO-TH—86-09) **Connection of two-particle relativistic quantum mechanics with the Bethe-Salpeter equation.** Sazdjian, H. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). Feb 1986. 36p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750579.

We show the formal equivalence between the wave equations of two-particle relativistic quantum mechanics, based on the manifestly covariant hamiltonian formalism with constraints, and the Bethe-Salpeter equation. This is achieved by algebraically transforming the latter so as to separate it into two independent equations which match the equations of hamiltonian relativistic quantum mechanics. The first equation determines the relative time evolution of the system, while the second one yields a three-dimensional eigenvalue equation. A connection is thus established between the Bethe-Salpeter wave function and its kernel on the one hand and the quantum mechanical wave function and interaction potential on the other. For the sector of solutions of the Bethe-Salpeter equation having non-relativistic limits, this relationship can be evaluated in perturbation theory. We also device a generalized form of the instantaneous approximation which simplifies the various expressions involved in the above relations. It also permits the evaluation of the normalization condition of the quantum mechanical wave function as a three-dimensional integral.

17143 (ITEP—149(1985)) On (quasi) stable gluino. Okun, L.V.; Voloshin, M.B. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700753.

It is demonstrated that experimental limits exist on the abundance of the anomalous isotopes of hydrogen and oxygen, on the rate of proton decays in large underground water detectors and on the cross sections of production of anomalous particles in accelerator experiments exclude the existence of (quasi)stable gluino lighter than a few GeV. 22 refs.

17144 (ITEP—153(1985)) Once again about the role of gluonic mechanism in interaction of light Higgs boson with hadrons. Voloshin, M.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700754.

Low-energy theorems of QCD are employed to show that the coupling to gluons enchances hadronic decays of a light (Msub(H) < or approximately 1.5GeV) Higgs boson by few orderes of magnitude in comparison with previous estimates. This coupling is also essential for H boson with a larger mass.Thus the μ/sup +/μ/sup -/ branching ratio is heavily suppressed. A simple low-energy theorem as derived for production amplitude of light H which also enables to evaluate non-perturbative contribution to the amplitude. By a method analogous to bremsstrahlung calculation the branching ratio of γ decay into a light Higgs plus hadrons is evaluated to be of the order of 3 x 10/sup -5/ if the coupling of H to b-quark is described by the standard minimum model. 20 refs.; 3 figs.

17145 (JINR—E-2-85-737) Semileptonic decays of ordinary and charmed Λ/sup +/sub(c) baryons in chiral theory. Kalinovskij, Yu.L.; Sarikov, N.A.; Takhtamyshev, G.G. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 6p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700776.

The phenomenological chiral Lagrangian method is applied for describing the semileptonic decays of ordinary and charmed Δsub(c)sup(+) baryons. The calculated partial widths (or relative probabilities) of ordinary baryon decays agree with the experimental data available. That confirms the Cabibbo theory with chiral currents and permits to predict the probabilities of such decays not exactly yet measured. For Δsub(c)sup(+) three- and four-body decays are calculated. Probability of Cabibbo-resolved decay of Δsub(c)sup(+)->Δsub(eν) is in agreement with the data on Δsub(c)sup(+)->Δechi, whereas for Δsub(c)sup(+)->p$\pi e\nu$ and Δsub(c)sup(+)->pK$e\nu$ calculated value is smaller as compared to the experimental one for Δsub(c)sup(+)->pechi. The lifetime of Δsub(c)sup(+) is estimated to be equal to rsub(Δsub(c)sup(+))=(2.0+-0.7)x10.sup(-13)s. 9 refs.; 1 fig.; 2 tabs.

17146 (JINR—E-2-85-808) Mass formula for multibaryon resonances and prediction of a new stable baryon. Nichitiu, F. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1985. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700780.

The main ideas for deriving a new mass formula for multibaryons as well as for baryons are presented. The price paid should be the existence of some new baryon states which do not destroy the usual octet and decupled representation. The most interesting baryon new state seems to be R(J=1/2, I=3/2) of mass approximately 1025 MeV which should be stable against the strong interaction (a good candidate for a stable hybrid state). 17 refs.; 8 figs.; 1 tab.

17147 (JINR—R-2-85-343) On pair production of Majorana particles in collisions of polarized e/sup +/ and e/sup -/. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701333.

Submitted to the journal Phys. Lett. and 8. Warsaw symposium on elementary particle physics, 1985.

Production of two different Majorana fermions in collisions of longitudinally polarized e/sup +/ and e/sup -/ is considered on the basis of general invariance principles. Polarization characteristics of the process are discussed in detail. Possible methods for checking CP and CPT-invariance are suggested. Some tests which would allow to distinguish whether the final particles are of Majorana or Dirac type are proposed. 6 refs.

17148 (JINR—R-2-86-147) Gluon bremsstrahlung in supersymmetric QCD. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1986. 6p. (In Russian). (CONF-8604294—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701145.

From International seminar quark; Tbilisi, USSR (1 Apr 1986).

Submitted to the journal Theor. Math. Phys. .

In the lowest a/sup 3/ order perturbation theory of supersymmetric QCD a gluon bremsstrahlung in the scalar quark pair production is calculated. The factorization of corresponding Born cross section and generalized infrared factors is shown. 9 refs.; 2 tabs.

17149 (JINR-R—1-85-228) Differential cross section of the π/sup -/p -> eta/sup 0/Δ/sup 0/(1232) reaction at the momentum of 3.3 Gev/s. Arkhipov, V.V.; Astvatsaturov, R.G.; Knapik, E.; Plyashkevich, S.N.; Khachaturyan, M.N.; Chvyrov, A.S.; Aslanyan, P.Zh.; Khudaverdyan, A.G.; Ioan, I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1985. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700789.

Submitted to the journal Sov. J. Nucl. Phys. .

The differential cross section of the reaction πp -> eta/sup 0/Δ/sup 0/ (1232) has been measured in the region of momentum transfers from tsub(min) to 0.3 (GeV/c)/sup 2/. A significant minimum observed in the forward direction in the differential cross section indicates a dominance of the helicity flip amplitude. The experimental data were fitted by the formula dσ/dt=A(1-gCt)esup(Ct), where g is the ratio of the spin flip and spin nonflip amplitudes. The following values were found for A, g and C: A=(65.7 +- 2.3) νb(GeV/c)/sup 2/; g=(3.7 +- 0.2); C=7.3 +- 0.6 (GeV/c)sup(-2). The total cross section for the reaction π/sup -/ -> ν/sup 0/Δ/sup 0/(1232) within the experimental errors, agrees, with the isotopic invariance prediction. 10 refs.; 5 figs.; 3 tabs.

17150 (JINR-R—2-85-152) Bag model from the preons. Matveev, V.A.; Chizhov, A.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700793.

Submitted to the journal Sov. J. Nucl. Phys. .

A dynamic bag-like model is suggested for composite quarks and leptons. A special compensation condition ensures that chiral violations are small while sizes and energy levels of composite fermions are quantized. An expression for the magnetic moment of the composite system is obtained in the small-size limit with the collective motion taken into account. It is shown that for the Harari rishon model one is unable to get satisfactory values of the magnetic moments for all composite fermions simultaneously. 10 refs.; 1 tab.

17151 (JINR-R—2-85-767) Pseudoscalar and vector meson masses in the quark loop model. Volkov, M.K.; Ivanov, A.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700798.

Submitted to the journal Teor. Mat. Fiz. .

On an example of calculating vector and pseudovector mass spectra self-consistency of the superconductive quark model (the quark loop model) is proved. By fixing the mass difference of u, s-quarks and u, d-quarks from the mass difference of rho-, phi-mesons and decay ω -> π/sup +/π/sup -/ width it is possible to describe correctly both the vector and pseudovector meson mass spectrum, as well as such a subtle effect as the mass difference of K/sup 0/- and K/sup +/-mesons. Besides, a correct value is found for the dif-

ference of decay constants of π- and K-mesons (Fsub(π) and Fsub(K)). 12 refs.

17152 **(JINR-R—2-85-831) Electromagnetic corrections to elastic radiative tail in deep inelastic lepton-nucleon scattering.** Akhundov, A.A.; Bardin, D.Yu.; Shumejko, N.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700800.

Submitted to the journal Sov. J. Nucl. Phys. .

Higher-order radiative effects in the deep inelastic lepton-nucleon scattering are discussed. One of such effects, the electromagnetic radiative correction to the elastic radiative tail, is completely calculated. As is shown, this correction gives everywhere, except of the infrared region, a rather small contribution of an order of O(α). 26 refs.; 1 fig.

17153 **(LAPP-TH—147) Higgs boson production by W and Z collisions.** Lindfors, J. (Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules). Oct 1985. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750585.

We present a general formulation for the WW → H and ZZ → H mechanisms of heavy Higgs boson production in hadron colliders. The known results in the effective W approximation are obtained from the quark-parton model limit of the double inelastic scattering configuration. In addition we estimate contributions from the elastic scattering configurations and from αsub(s)-processes of QCD.

17154 **(LAPP-TH—152) Magnetic monopoles: from classical to quantum physics.** Seixas, J. (Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules). Jan 1986. 10p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750580.

We develop a modified Metropolis algorithm and use it to construct axial-symmetric and multimonopole classical solutions in the (lattice-regularized) SO(3) Georgi-Glashow model outside the BPS limit. As an example we then use one of those solutions as an ansatz to study the quantum stability of the configuration.

17155 **(SLAC-PUB—4144) Heavy flavors.** Cox, B.; Gilman, F.J.; Gottschalk, T.D. (Fermi National Accelerator Lab., Batavia, IL (USA); Stanford Linear Accelerator Center, Menlo Park, CA (USA); California Inst. of Tech., Pasadena (USA)). Nov 1986. 13p. (CALT—68-1411; FNAL/C—86/166; CONF-8606215—28). NTIS, PC A02/MF A01. File Number DE87004559.

From Summer study on the physics of the superconducting super collider ↑; 0.

A range of issues pertaining to heavy flavors at the SSC is examined including heavy flavor production by gluon-gluon fusion and by shower evolution of gluon jets, flavor tagging, reconstruction of Higgs and W bosons, and the study of rare decays and CP violation in the B meson system. A specific detector for doing heavy flavor physics and tuned to this latter study at the SSC, the TASTER, is described. 36 refs., 10 figs.

17156 **Production of mirror fermions near the Z/sup 0/ peak.** Banks, T.; Karliner, M. (Stanford Linear Accelerator Center, CA, USA; Tel Aviv Univ., Israel; Stanford Linear Accelerator Center, CA, USA). *Nuclear Physics [Section] B;* **281**: No. 3/4, 399-410(2 Feb 1987). Contract AC03-76SF00515.

Several attractive theories predict the existence of mirror fermions. There is a good theoretical reason to expect that the lightest mirror fermions might have relatively long lifetimes. We explore the experimental consequences of such a possibility, focusing on mirror lepton production at the SLC near the Z/sup 0/ resonance. We find that by going slightly off resonance or by polarizing the electron beam one can clearly distinguish the mirror leptons from ordinary leptons.

17157 **CP violation in heavy flavor decays: Predictions and search strategies.** Bigi, I.I.; Sanda, A.I. (Stanford Linear Accelerator Center, CA, USA; Rockefeller Univ., New York, USA). *Nuclear Physics [Section] B;* **281**: No. 1/2, 41-71(19 Jan 1987). Contract AC03-76SF00515;AC02-81ER40033.

We present a comprehensive analysis of the phenomenology relevant for CP violation in exclusive B and D decays. Some of the CP asymmetries can be calculated rather reliably in the standard model, while others contain large uncertainties. We point out that studies of inclusive decays will have to deal with partial cancellations occurring between different exclusive channels. None of the measurements will be easy. Yet a realistic evaluation f the promise the various searches hold out cannot be given at present; first, one has to build a data base on the production and decay properties of heavy flavor decays. We try to identify the required information.

17158 **(CEA-CONF—8513) Conformal invariance and finite size effects in critical two dimensional statistical models.** Itzykson, C. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). May 1986. 31p. (CONF-8605207—1). NTIS (US Sales Only), PC A03/MF A01. File Number DE87750578.

From 9. Sitges conference; Sitges, Spain (26 May 1986).

A systematic review of the recent achievements in conformal invariant two-dimensional field theories would already require a volume size. Here we discuss some finite size effects, because they reveal important features. The computation of the partition function in a finite geometry - a torus - enables one to understand the spectrum of the theory. The later is a compendium of the critical dimensions of the various operators. Two simple examples, namely bosonic or fermionic free fields (respectively the Gaussian and the Ising model) serve as a pedagogic introduction, although the corresponding computations are not without some subtleties. We then proceed to considerations related to modular invariance.

17159 **(JINR—E-2-85-794) Construction of finite N=1 supersymmetric Yang-Mills theories.** Ermushev, A.V.; Kazakov, D.I.; Tarasov, O.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 6p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700779.

Submitted to the journal Pis'ma Zh. Ehksp. Teor. Fiz. .

We propose an algorithm to construct ultraviolet finite N=1 supersymmetric gauge theories. Necessary and sufficient conditions for divergences to cancel in all orders of perturbations theory are exhausted in one-loop order. 7 refs.

17160 **(LA-UR—86-4144) More on the first order chiral symmetry transition in QCD.** Gupta, R. (Los Alamos National Lab., NM (USA)). Sep 1986. Contract W-7405-ENG-36. 9p. (CONF-8609142—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003726.

From Lattice gauge theory meeting; Upton, NY, USA (15 Sep 1986).

We present evidence from numerical simulations for a first order chiral symmetry restoration transition in QCD at finite temperature. Also, for quarks in the fundamental representation, there is a simultaneous deconfinement transition. These transitions are present only for small quark masses. We use an exact algorithm to incorporate the dynamical quarks.

(Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 15p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700729.

Submitted to the jornal Z. Phys.,C.

On the basis of the infrared asymptotics of the lower QCD Green functions obtained before a definition and elaborate a technique for calculating nonperturbative vacuum expectations of gluon and quark fields are proposed. In calculations the known QCD parameters was used: constituents quark masses, the confining potential slope and the QCD parameter Λ. The values obtained for the vacuum expectations agree well with the experiment. 26 refs.

17164 (ITEF—182(1984)) On the anomalous supermultiplet in th Wess-Zumino model. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1984. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701321.

An anomalous multiplet construction technique is suggested; it doesn't contain axial anomaly in the Wess-Zumino model. In this technique supercurrent anomaly is determined by a surface term. 9 refs.; 1 fig.

17165 (ITEP—45(1985)) Instantons versus SUSY. Shifman, M.A.; Vainstejn, A.I.; Zakharov, V.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 58p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87700751.

This survey is a written version of lectures given at the Bakuriani Workshop on High Energy Physics, January, 1985. The authors discuss the recent discovery on a new phenomenon - dynamical symmetry breaking in supersymmetric gauge theories with matter - which is generated by instantons. Under a certain choice of the matter multiplets the gauge invariance is inevitably spontaneously broken, gauge bosons acquire masses, the evolution of the running coupling constant is frozen and there is a weak coupling regime. Sometimes the pattern includes also spontaneous supersymmetry breaking. Both basic aspects of the mechanism and particular dynamical scenarios realized in typical models are described. 33 refs.; 4 figs.; 1 tab.

17166 (ITEP—156(1985)) Multiinstantons and monopoles in SU(2) gluodynamics. Simonov, Yu.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 23p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700756.

Specially constructed multiinstantonic solutions - called tau-monopoles - are shown to possess properties both of instantons and monopoles. In the limit of infinite length in x/sub 4/ direction they go over into Rossi monopoles with colormagnetic field similar to that of 'tHooft-Polyakov monopole. A model of vacuum stochastically populated with tau-monopoles is constructed which provides an area law for spacial Wilson loops. 23 refs.

17167 (ITF—86-4-R) Quantum field theory renormalization in curved space-time and renormalization group equations. Bukhbinder, I.L. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1986. 21p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700758.

The structure of quantum field theory renormalization in curved space-time is investigated. The renormalization group equations for vacuum energy and vertex functions in an external gravitational field are established. It is shown that the asymptotically free theories may be asymptotically conformal invariant. The properties of the effective potential in an external gravitational field are studied. 43 refs.

17168 (ITF—86-18-R) Chiral anomalies and finite-mode regularization of the fermion integral. Andrianov, A.A. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1986. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700759.

The dynamical frame method in the space of spinor wave functions is applied to determine and regularize the fermion functional integral in a gauge-invariant way. Both topological and non-topological anomalies are obtained in a manifest form by means of the finite-mode regularization of generating functional for fermion currents. The requirement of generalized unitarity gives unambiguously the anomaly structure. A non-local extension of chiral transformations and conservation laws for axial currents is considered. 28 refs.

The problem concerning a continuum limit in the lattice gluon field thermodynamic with SU(N) gauge group is considered. An examination of exactly solvable models provides a receipt for the lattice and finite volume effects to be eliminated. 22 refs.; 4 figs.; 3 tabs.

17170 (JINR—E-2-85-779) Infrared asymptotics of perturbative QCD. Renormalization properties of the Wilson loops in higher orders of perturbation theory. Korchemskij, G.P.; Radyushkin, A.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 20p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700778.

Submitted to the journal Yad. Fiz. .

The approach based on the loop space formalism is applied for the investigation of renormalization properties of the Wilson loop in higher orders of perturbation theory. The properties are considered of the subtraction procedure for the cusp singularities of path-ordered exponentials. The cusp anomalous dimension is calculated in the order asub(s)sup(2). The general form of its perturbative expansion is obtained in the limit of large Minkowski cusp angles y. The analyticity properties with respect to y of the results obtained are investigated. The relation of these results to the non-leading infrared behaviour of the quark form factor is demonstrated. The final expressions can be applied for construction of the anomalous dimensions of the renormalization group equations de-

scribing the infrared asymptotics of perturbative QCD. 18 refs.; 5 figs.

17171 **(JINR—E-2-85-865) Dualities in the d=2 asymmetric chiral field sigma models.** Ivanov, E. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700781.

Continuous dual symmetry of equations of asymmetric chiral field (ACF) in d=2 (equations of non-linear σ-models with ambiguous effect) and realization of duality transformations in explicit geometrical language of Cartran form is disclosed. Connection of this symmetry with ACF integrability is clarified. Both simple and supersymmetrical cases are considered. Notions of dual algebra and dual σ-model are introduced, their significance for understanding classical and quantum structure d=2 of ACF models is revealed. It is shown, in particular, that transition to points of infrared ACF stability can be described purely algebraically as constraction of dual algebra bringing about the fact that space-factor of the corresponding dual σ-model becomes plane. Equations of asymmetrical n vector-field model are analyzed from the similar view point. The Cartran form method permits to state that classical dynamics of this model is trivial. 28 refs.

17172 **(JINR—R-2-85-729) Quantum principles in field interactions.** (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 22p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701334.

The concept of quantum principle is introduced as a principle, the formulation of which is based on specific quantum ideas and notions. Three of such principles are considered: the principle of quantizability; the principle of local gauge symmetry; the principle of supersymmetry; and their role in development of the quantum field theory (QFT). Concerning the first of them formal aspects and physical contents of the renormalization procedure in QFT, its relation to ultraviolet divergences and the renorm-group are analyzed. The renormalizability property, formulated as an existence condition of a self-consistent quantum version with a given mechanism of the field interaction, turns out to be equivalent to quatizability. It is shown that the consecutive, from a historical point of view, use of these quantum principles puts still larger limitations on possible forms of field interactions. 21 refs.

17173 **(JINR-R—2-85-420) Fock representation for quaternion fields.** Govorkov, A.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700794.

Submitted to the journal Theor. Math. Phys. .

The Fock representation for a nonrelativistic hermitian (Majorana) quaternion field is established and the corresponding quantum mechanics of parafermions of third order is formulated. The difference between gauge pseudocolour SO(3)-symmetry, the automorphism group of quaternions, and the global SU(3)-symmetry of parafermion states in the Fock-space is emphasized. 18 refs.

17174 **(JINR-R—2-85-520) Is it necessary to prove the "potential" confinement in QCD.** Pervushin, V.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700795.

Submitted to the journal Found. Phys. .

The minimal approach to quantization scheme of non-Abelian theory in terms of physical gauge-invariant variables is discussed. It is shown that such a minimal quantization scheme already in the framework of perturbation theory contains the theoretical basis for nonobservation of free colour particles and for the method of measuring their quantum numbers in deep inelastic processes. The proof of the potential nonperturbative confinement in such an approach is unnecessary. 18 refs.

17175 **(JINR-R—2-85-723) Metric nature of spinor field.** Chernikov, N.A.; Shavokhina, N.S. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700797.

Connection is studied between the following algebraic, geometric, and physical objects (taken in a historical sequence): triples of Pythagoras numbers, Grassmann algebras, Cliffford algebras, cartan spinors the Dirac equation, the Fock-Ivanenko covariant derivative, fermion and boson fields. Pythagoras formulae for a right triangle are shown to lead immediately to a spinor representation of the Lorentz orthochronous group. The state vector in quantum fermion theory is proved to be a spinor of the Euclidean space, and in quantum boson theory a spinor of the symplectic space. A metric nature of the spinor field is to be emphasized: no metric tensor, no spinor fields. The practical problem of ancient ages, to draw a right triangle on the Earth surface, appears to be closely related with basic physical theories of modern times. 8 refs.

17176 **(JINR-R—2-85-942) Fermionic string model in spaces of Lie group.** Isaev, A.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700801.

Submitted to the journal Teor. Mat. Fiz. .

Theory of string (with fermionic degrees of freedom) moving in a curved space-time (in Lie group space) is discussed. Dynamics of fermionic string in the noncompact simple group Lie spaces is studied using field theory methods. The general solution of Cauchy problem is obtained, and a complete set of integrals of motion is constructed. The classical analogues of physical particles operators are obtained by the collective coordinate method. It enables one to construct dual scattering amplitudes in the theory considered. 21 refs.

17177 **(JINR-R—4-85-816) Solution of Faddeev differential equations for scattering problem in three identical particle system. Calculation algorithm. The finite-dimensional approximation method.** Belyaev, V.B.; Kochkin, V.I.; Kartavtsev, V.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1985. 4p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700802.

A Faddeev equation for a radial part the Faddeev component of a three-particle wave function was solved in order to determine the length of scattering of a particle on a bound pair. The method of solution is based on finite-dimensional approximation of the Laplacian by a linear combination of projection operators. For the potential averages over the hyperspherical angle the scattering length was found to be 3.59 F within the 4-rank approximation. 3 refs.; 1 tab.

17178 **(JINR-R—9-85-271) Relativistic theory of forming space charge laminar flows.** Aleksakhin, Yu.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of New Acceleration Methods). 1985. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700806.

Submitted to the journal Sov. Phys. - Tech. Phys. .

The set of equations of O.Buneman's self-consistent electrodynamics which describes the non-vortical laminar flow is completed with an equation for the charge scalar density. A non-geometrical approach to the problem of forming the azially symmetric Brillouin flow is formulated. Based on paraxial expansion a synthesis method for the design of solid Brillouin flow sources is developed. An example of computation in the first paraxial approximation is given. 14 refs.

17179 **(LA-UR—86-4152) Supersymmetry and model building.** Raby, S. (Los Alamos National Lab., NM (USA)). Jun 1986. Contract W-7405-ENG-36. 49p. (CONF-8606259—1). NTIS, PC A03/MF A01; GPO Dep. File Number DE87003727.

From Theoretical Advanced Study Institute conference; Santa Cruz, CA, USA (1 Jun 1986).

An introductory review of supersymmetry and supersymmetric model building is presented. The topics discussed include, a brief introduction to the formalism of supersymmetry, the gauge hierarchy problem, the minimal supersymmetric standard model and supersymmetric grand unified theories.

17180 **(LBL—22277) String theory and holomorphic line bundles.** Alvarez, O. (Lawrence Berkeley Lab., CA (USA)). 29 Sep 1986. Contract AC03-76SF00098. 8p. (UCB-PTH—86/30; CONF-8604202—3). NTIS, PC A02. File Number DE87002562.

From 7. workshop on grand unification; Toyama City, Japan (16 Apr 1986).

Some elementary facts about holomorphic line bundles are discussed along with some applications to string theory.

17181 **(NBI-HE—84-39) Chiral order parameter of Wilson fermion formulation in a lattice CP/sup N-1/ model.** Abdalla, E.; Abdalla, M.C.B.; Kawamoto, N. (Niels Bohr Inst., Copenhagen (Denmark)). Oct 1984. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750533.

We study the Wilson formulation of fermions in the CP/sup N-1/ model by means of a non-standard definition of the vacuum.

17182 **(NUB—2663) Solving QCD using Monte Carlo Renormalization Group method.** Gupta, R.; Patel, A. (Northeastern Univ., Boston, MA (USA). Dept. of Physics; Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA)). 1984. Contract AS03-81ER40029. 8p. (UCSD—10P10-240; CONF-8411288—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87002875.

From DPF meeting; Santa Fe, NM, USA (1 Nov 1984).

The need for the use of Monte Carlo Renormalization Group method for solving QCD is stressed. MCRG results for the non-perturbaive β-function and the improved action for SU(3) are presented using the $\sqrt{3}$ blocking transformation introduced by Cordery, Gupta and Novotny. The existing Monte Carlo results are analyzed to check for scaling in the range of couplings in which the β-function shows a dip. Finally a status report of MCRG calculations using an improved action is given. 10 refs.

17183 **Energy-momentum tensor on a Riemann surface.** Sonoda, H. (Lawrence Berkeley Lab., CA, USA). *Nuclear Physics [Section] B;* **281**: No. 3/4, 546-572(2 Feb 1987). Contract AC03-76SF00098.

The tecniques of conformal field theory developed for a Riemann sphere by Belavin, Polyakov, and Zamolodchikov are generalized to any Riemann surface. We especially consider the energy-momentum tensor in the bosonic string theory of Polyakov. The correlation functions of the energy-momentum tensor with local fields are studied in detail. As an application we compute the scattering amplitudes of null physical states explicitly to show that they vanish.

17184 **Thirring strings.** Neuberger, H.; Niemi, A.J.; Semenoff, G.W. (Lawrence Berkeley Lab., CA, USA; Ohio State Univ., Columbus, USA. Dept. of Physics; California Univ., Berkeley, USA. Dept. of Physics; British Columbia Univ., Vancouver, Canada. Dept. of Physics). *Physics Letters [Section] B;* **181**: No. 3/4, 244-248(4 Dec 1986). Contract FG05-86ER40265;AC03-76SF00098;AC02-76ER01545.

Previously it has been observed that a squeeze transformation modifies the central charge of the Virasoro algebra of closed bosonic strings. Here it is shown that this transformation maps a free bosonic string to a string based on the massless Thirring model. Diagonalization of the mass operator of the Thirring redefines the central charge back to its canonical value, and the squeeze parameter assumes the role of the compactification radius of a bosonic coordinate of the string.

17185 **Low energy superstring theory.** Ovrut, B.A. (Rockefeller Univ., New York, NY). pp 21-28 of Particles and the universe. Lazarides, G.; Shafi, Q. (eds.). Amsterdam, Netherlands; North-Holland Physics Publishing (1986). (CONF-8506195—). Contract AC02-81ER40033.

From International symposium on particles and the universe; Thessaloniki, Greece (24 Jun 1985).

The spontaneous breakdown of the E_8 gauge group of low energy superstring theory is discussed, and a method given for determining the residual gauge group. They show that certain chiral supermultiplets can be naturally light and that, as a consequence, the residual gauge group SU(3)/sub C/ x SU(2) /sub L/ x SU(2)/ sub R/ x U(1)/sub Y/ x U(1) is singled out.

17186 **Scalar sector of gauge theories and the quest for a unified theory.** Beg, M.A.B. (Rockefeller Univ., New York, NY). pp 61-78 of Particles and the universe. Lazarides, G.; Shafi, Q. (eds.). Amsterdam, Netherlands; North-Holland Physics Publishing (1986). (CONF-8506195—). Contract AC02-81ER40033.

From International symposium on particles and the universe; Thessaloniki, Greece (24 Jun 1985).

The state of the scalar sector in gauge theories is critically examined. Much of the discussion is predicated on the generally accepted - albeit not rigorously proven - result that self-coupled scalar fields constitute a trivial dynamical system characterized by a unit S-matrix. A process of elimination leads to the conclusion that canonical electroweak theory can find consistency only after grand unification embedding is followed by a further synthesis; if there be but four basic forces, this would mean with gravity. Alternatives considered include a provisional scenario that permits one to live with the standard model over a substantial energy domain, and a bold proposal to dispense with elementary scalars altogether by introducing hypercolor-based dynamical symmetry breaking. Experimental implications of these constructs are reviewed; it is suggested that they are sufficiently interesting to warrant investigation even if the theories that yielded them fail to survive. Prospects of the unification program, with each of its steps evidently needed to solve embarrassing theoretical problems, are briefly discussed in the light of recent attempts to tame gravitation.

17187 **Problem of families.** Senjanovic, G. (Brookhaven National Lab., Upton, NY). pp 103-114 of Particles and the universe. Lazarides, G.; Shafi, Q. (eds.). Amsterdam, Netherlands; North-Holland Physics Publishing (1986). (CONF-8506195—). Contract AC02-76CH00016.

From International symposium on particles and the universe; Thessaloniki, Greece (24 Jun 1985).

The authors review attempts to unify fermionic families and discuss the question of quark and lepton masses.

17188 **Fermion masses in GUTs with intermediate scales.** Panagiotakaopoulos, C. (Rockefeller Univ., New York, NY). pp 139-142 of Particles and the universe. Lazarides, G.; Shafi, Q. (eds.). Amsterdam, Netherlands; North-Holland Physics Publishing (1986). (CONF-8506195—). Contract AC02-81ER40033.

From International symposium on particles and the universe; Thessaloniki, Greece (24 Jun 1985).

The relation m/sub t//m/sub c/ $\approx$ m/sub b//m/sub s/, with m/sub s/ not equal to m/sub μ/, which predicts a top quark mass close to 40 GeV is consistently derived in the context of SO(10) and E_8 grand-unified theories with appropriate intermediate scales.

REFER ALSO TO CITATION(S) 16160, 17105, 17264

17190 **(BARC—1253) Annual report of the Nuclear Physics Division [for] period ending December 31, 1982.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 130p. NTIS (US Sales Only), PC A07/MF A01. File Number DE87701249.

The research and development work of the Nuclear Physics Division of the Bhabha Atomic Research Centre, Bombay for the period ending on 31 December 1982 is reported in the form of individual summaries arranged under the headings: (1) nuclear physics, (2) solid state physics, and (3) instrumentation and techniques. A

list of papers by the staff-members of the Division published in journals and presented at conferences during the report period is also given.

17191 **(BARC—1297) Progress report on nuclear data activities in India for the period from July 1984 to December 1985.** Anand, R.P. (comp.). (Bhabha Atomic Research Centre, Bombay (India)). 1986. 52p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87700666.

Nuclear data activities in the Bhabha Atomic Research Centre, Bombay and the Indira Gandhi Centre for Atomic Research (formerly known as the Reactor Research Centre), Kalpakkam are reported in the form of summaries. The report contains information about nulcear data measurements, compilations, evaluations and other related work. (M.G.B.).

17192 **(CONF-861193—2) Covariances of evaluated nuclear data based upon uncertainty information of experimental data and nuclear models.** Poenitz, W.P.; Peelle, R.W. (Argonne National Lab., Idaho Falls, ID (USA); Oak Ridge National Lab., TN (USA)). 17 Nov 1986. Contract W-31109-ENG-38. 6p. NTIS, PC A02. File Number DE87004688.

From IAEA specialists' meeting on covariance methods and practices in the field of nuclear data; Rome, Italy (17 Nov 1986).

A straightforward derivation is presented for the covariance matrix of evaluated cross sections based on the covariance matrix of the experimental data and propagation through nuclear model parameters. 10 refs.

17193 **(DOE/ER/40159—113) The structure of nuclei far from beta stability: Progress report for the period May 15, 1986 to May 14, 1987.** Zganjar, E.F. (Louisiana State Univ., Baton Rouge (USA). Dept. of Physics and Astronomy). 1987. Contract FG05-84ER40159. 39p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004849.

Investigations of the Z = 78-82 region involve gold, mercury, and thallium isotopes. A great deal of effort is being directed at a description of shape coexistence in this region. Additional research in the neutron deficient rare earth region and the Z = 36, N approximately equal to Z regions concerns nuclear deformation. The Z = 36 region research has been conducted using an in-beam gamma-ray spectroscopy system using a recoil mass spectrometer. Structure studies of Ba-145 are also being conducted. 31 refs., 7 figs.

17194 **(HMI-B—429) HMI Section of Nuclear and Radiation Physics - Annual report 1985.** (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.). Bereich Kern- und Strahlenphysik). 1986. 196p. (In German and English). NTIS (US Sales Only), PC A09/MF A01. File Number DE87750520.

This annual report contains extended abstracts about the work performed at the named institute concerning theoretical physics, nuclear reactions, hyperfine structure, atomic collisions, and developments of the VICKSI accelerator together with a list of publications and talks. (HSI).

17195 **(IAEA-TECDOC—385) International Centre for Theoretical Physics. Scientific activities in 1985.** (International Atomic Energy Agency, Vienna (Austria)). Aug 1986. 129p. NTIS (US Sales Only), PC A07/MF A01. File Number DE87701287.

A review of the scientific activities of the Centre, including workshops, research, and training-for-research is presented. The scientific program consists of ten main fields, Physics and Energy, Fundamental Physics, Physics of Condensed Matter, Applied Physics, Physics of the Living State, Physics of the Environment, Mathematics, Physics Teaching, Experimental Physics Training, and Physics and Development. In addition to a brief description of each workshop, symposium, college, and meeting, tables summarizing the participation at ICTP activities are given. A list of preprints and internal reports issued in 1985 is included. Tabs.

17196 **(INDC(NDS)—182/GE) Co-ordination of the international network of nuclear structure and decay data evaluators. Summary report of a consultants' meeting held at the Centre d'Etudes Nucleaires de Grenoble, France, 2-5 June 1986.** Lorenz, A. (ed.). (International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee). Oct 1986. 72p. (CONF-8606171—Summ.). NTIS (US Sales Only), PC A04/MF A01. File Number DE87700915.

From IAEA meeting on the coordination of the international nuclear structure and decay data evaluation network; Grenoble, France (2 Jun 1986).

The seventh meeting of the International Network of Nuclear Structure and Decay Data (NSDD) Evaluators concentrated on the organizational aspects of the coordination of the NSDD network and on the presentation and discussion of papers related to the physics of evaluation of NSDD. The report contains short status reports from NSDD Network members, the status of the mass-chain and nuclear structure data, a discussion of evaluation rules and procedures and a short presentation of the next activities.

17197 **(ITEF—25(1985)) Inclusive cross sections of π/sup +/, p, /sup 2/H, /sup 3/H, /sup 3/He yields at angle 3.5 deg in 6.37 and 8.08 GeV/c proton interactions with Be, Al, Cu, Ta nuclei.** Aref'ev, A.S.; Vorontsov, I.A.; Ergakov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700742.

Inclusive differential cross sections of π/sup +/, p/sup 2/H, /sup 3/H, /sup 3/He yields at the angle of 3,5 degree are measurered in secondary 1.25 + 7.06 GeV.c momentum interval during 6.37 and 8.08 GeV/c proton interaction with Be, Al, Cu, Ta nuclei. The data obtained are presented in tables. 5 refs.; 5 figs.

17198 **(ITEF—121(1985)) Isotope and isotonic effects in nucleon inclusive production at high energies.** (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 15p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701320.

Proton, neutron and deuteron yields as well as spectrum shape of protons, produced in π/sup -/(5 GeV/c) and p(7 GeV/c) interactions with different nuclei are analysed. A special attention is paid to data, obtained at separated /sup 6/Li, /sup 7/Li, /sup 10/B, /sup 11/B, /sup 58/Ni, /sup 64/Ni, /sup 112/Sn, /sup 124/Sn isotopes. Isotope-effect, which consists in the fact, that protonyields do not depend on isotope neutron composition and the isotope-effect, which consists in the fact that neutron yields do not depend on Z in isotopes are confirmed for heavy nuclei. It isshown, that the isotope-effect is realised only averagely: in the range of T=80-180 MeV. Minor dependence (of the order of 3%) of proton spectrum slope on the isotope neutron composition is observed. 12 refs.; 6 figs.

17199 **(ITEF—130(1985)) Some topological characteristics of π/sup -/meson interactions with nuclei.** Vorob'ev, I.I.; Perepelitsa, V.F.; Ismatova, F.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 15p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700747.

Some topological characteristics of π/sup -/-meson interactions with 2.9 and 4 GeV/c momenta with C and Xe nuclei such as distributions by the number of prongs, proton multiplicities and net charge including two-dimensional ones are presented. All the data are obtained under conditions of 4π-geometry. 9 refs.; 4 figs.; 4 tabs.

17200 **(JAERI-M—86-067) Report of the joint seminar on heavy-ion nuclear physics and nuclear chemistry in the energy region of tandem accelerators (II).** (Japan Atomic Energy Research Inst., Tokyo). Apr 1986. 121p. (CONF-8601103—). NTIS (US Sales Only), PC A06/MF A01. File Number DE87701064.

From 2. joint seminar on heavy-ion nuclear physics and nuclear chemistry in the energy region of tandem accelerators; Tokai, Ibaraki, Japan (9 Jan 1986).

A meeting of the second joint seminar on Heavy-Ion Nuclear Physics and Nuclear Chemistry in the Energy Region of Tandem Accelerators was held after an interval of two years at the Tokai Research Establishment of the JAERI, for three days from January 9 to 11, 1986. In the seminar, about 70 nuclear physicists and nuclear chemists of JAERI and other Institutes participated, and 38 papers were presented. These include general reviews and topical subjects which have been developed intensively in recent years, as well as the new results obtained by using the JAERI tandem accelerator. This report is a collection of the papers presented to the seminar.

17201 **(JINR-R—1-85-820) Four-dimentional hadron jets-universal characteristics of particle multiple production.** Baldin, A.M.; Batyunya, B.V.; Gramenitskij, I.M.; Grishin, V.G.; Didenko, L.A.; Kuznetsov, A.A.; Metreveli, Z.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1985. 15p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700790.

Submitted to the journal Yad. Fiz. .

The data on multiple particle production in pp-, anti pp-, π/sup -/p-, π/sup -/C-pC and pTa interactions from 6 to 205 GeV/c momentum are analysed in the framework of a new relativistic invariant method. The hadron distributions (π/sup -/, Ksub(s)sup(0), LAMDAsub(0)) on squared four-velocity relative to jet axis have been obtained. It is shown that these distributions are independent on the energy and are the same for quark and multiquark system hadronization at Psub(lab) >22 GeV/c momentum. The observed universal properties of four-dimensional jets are perhaps fundamental characteristics of the interactions of colour charges with vacuum. 14 refs.; 6 figs.; 6 tabs.

17202 **(LA-UR—86-3786) The evaluation and application of redundant-cross-section covariances.** Muir, D.W. (Los Alamos National Lab., NM (USA)). 1986. Contract W-7405-ENG-36. 8p. (CONF-861193—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE87002917.

From IAEA specialists' meeting on covariance methods and practices in the field of nuclear data; Rome, Italy (17 Nov 1986).

Certain multigroup covariance libraries, notably COVFILS-2, omit all redundant (or summed) reactions on the grounds that the information content of a well-measured total cross section, for example, is implicitly contained in the covariances of the component, or partial, reactions that add up to the total. It is shown that, while redundant reactions can play an important role in cross-section and covariance evaluation, their emission from libraries intended for applications is justifiable. 3 refs.

17204 **(CEA-CONF—8542) Measurement of the muon capture rate in liquid deuterium by the lifetime technique.** Martino, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). Jul 1986. 3p. (CONF-860741—19; CEA-DPH-N-S—2364). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750463.

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

A new measurement was performed at Saclay in ultra-pure liquid deuterium and the neutron detection difficulties have been avoided by using the lifetime technique. Comments on the results are given.

17205 **(CEA-CONF—8546) Pion multiplicity in α-nucleus reactions from 200 to 800 A. MeV.** Alard, J.P.; Augerat, J.; Babinet, R. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). Aug 1986. 2p. (CONF-860802—4-Summ.). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750469.

From International nuclear physics conference; Harrogate, UK (25 Aug 1986).

Published in summary form only.

17206 **(CONF-8610196—5) Variational Monte Carlo calculations of few-body nuclei.** Wiringa, R.B. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004933.

From European workshop on few body physics; Rome, Italy (7 Oct 1986).

The variational Monte Carlo method is described. Results for the binding energies, density distributions, momentum distributions, and static longitudinal structure functions of the ^{3}H, ^{3}He, and ^{4}He ground states, and for the energies of the low-lying scattering states in ^{4}He are presented. 25 refs., 3 figs.

17207 **(LBL—22560) Recent results of μCF experiments at SIN [Swiss Institute For Nuclear Research].** Breunlich, W.H.; Cargnelli, M.; Bistirlich, J.; Crowe, K.M.; Justice, M.; Kurck, J.; Petitjean, C.; Sherman, R.H.; Bossy, H.; Daniel, H. (Lawrence Berkeley Lab., CA (USA); Oesterreichische Akademie der Wissenschaften, Vienna; Schweizerisches Inst. fuer Nuklearforschung, Villigen; Los Alamos National Lab., NM (USA); Technische Univ. Muenchen, Garching (Germany, F.R.). Physikdepartment). Sep 1986. Contract AC03-76SF00098. 39p. (CONF-8609135—7). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004475.

From International symposium on muon-catalyzed fusion; Tokyo, Japan (1 Sep 1986).

Important topics concerning Muon Catalyzed Fusion were investigated in experiments at the Swiss Institute for Nuclear Research (SIN), including transient and steady state rates for the main dμt cycle as well as detailed information about the competing dμd and tμt fusion branches. The basic kinetic parameters were determined and striking features of the resonant dμt formation process were revealed (density effect, epithermal behavior). DT sticking was measured with independent techniques, i.e., detection of fusion neutrons as well as μHe x-rays after fusion. Fusion yields per muon of 113 +- 10 were observed at liquid conditions, yields exceeding 200 are anticipated for optimal conditions from our results. 43 refs., 8 figs., 3 tabs.

6513 Nuclear Properties And Reactions, A=6-19, Experimental

17208 **(CEA-CONF—8468) Fragmentation of the projectile near the Fermi energy.** Dayras, R. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). May 1986. 17p. (CONF-860506—9; CEA-DPH-N-S—2352). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750449.

From International conference on heavy ion nuclear collisions in the Fermi energy domain; Caen, France (12 May 1986).

The experimental data about projectile fragmentation around the Fermi energy are reviewed. Comparisons with low and high energy data suggest that this energy domain is indeed a transition region. Reaction mechanisms dominated by the mean field at low energy progressively give way to individual n-n collisions. In the present case, this transition manifests itself by a rapid decrease of transfer reactions for the benefit of fragmentation processes. A coherent description of the observed results requires to take into account mean field effects as well as individual n-n collisions.

17209 **(DOE/ER/10420—8) Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987.** Prosser, F.W. (Kansas Univ., Lawrence (USA). Dept. of Physics and Astronomy). Jan 1987. Contract AC02-79ER10420;W-31109-ENG-38. 46p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005092.

The analysis of the fusion-evaporation cross section for $^{24}Mg + ^{24}Mg$ has been completed. As with other symmetric heavy-ion systems, this cross section appears to follow the prediction of a limitation imposed by the onset of fission. Much time has been spent on investigations of target-projectile systems leading to the ^{56}Ni compound nucleus, $^{16}O + ^{40}Ca$, $^{32}S + ^{24}Mg$, and $^{28}Si + ^{28}Si$. Status reports on earlier experiments in the final stages of analysis or being prepared for publication are given, as well as a description of a recent experiment on $^{16}O + ^{40}Ca$ at 15 MeV/A. In this experiment, coincidences between light nuclei and heavy residues and between pairs of heavy residues were obtained, as well as inclusive spectra of heavy residues and of complex light nuclei. A continuation of the search for production of n-p pairs emitted from fusion reactions in the $^1S_0$ deuteron state is reported. While this search is still unsuccessful, interesting information about the emission of nucleons from the ^{28}Si compound nucleus has been obtained. An investigation of incomplete fusion, using ^{12}C on heavy targets from ^{90}Zr to ^{197}Au, has been extended to ATLAS energies. While the initial run was not very successful, some useful data were obtained and a future run is planned. Efforts in the development and improvement of scintillation detectors for identification of Z = 1 and 2 nuclei from heavy-ion interactions have continued. 37 refs., 13 figs., 2 tabs.

17210 **(INS—550) Measurements of interaction cross sections and nuclear radii of Li isotopes.** (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study). Aug 1985. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701314.

Interaction cross sections(σ sub(I)) for all known Li isotopes (/sup 6/Li - /sup 11/Li) and /sup 9/Be on targets Be, C, and Al have been measured at 790 MeV/nucleon. Nuclear radii(R sub(I)) of these isotopes have been deduced from the σ sub(I). The differences of radii among isobars(/sup 6/He - /sup 6/Li, /sup 8/He - /sup 8/Li, and /sup 9/Li - /sup 9/Be) have been found for the first time. A comparison of R sub(I) with the rms radii obtained from electron-scattering is presented.

17211 **(JINR—E-1-85-861) γ-production in peripheral interactions of relativistic carbon nuclei in propane and the anomalon problem.** Cheplakov, A.P.; Chubarian, M.Y.; Gasparian, A.P.; Grigalashvili, N.S. (Joint Inst. for Nuclear Research, Dubna (USSR)). 1985. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700775.

Peripheral interactions of /sup 12/C nuclei with protons and carbon nuclei have been investigated in a 2m-propane bubble chamber at 4.2 GeV/c per nucleon. Energetic and angular characteristics of γ-quanta accompanying the production of multicharged fragments with Zsub(f)=5 and 6 have been analyzed. It is shown that in the fragment rest system there is an excess of γ-quanta with Esub(γ) < 40 MeV over the background from known sources (π/sup 0/ -> 2γ decays, bremsstrahlung and so on). 11 refs.

17212 **Observation of energetic protons in coincidence with pion-induced double charge exchange on /sup 12/C and /sup 48/Ca.** Morris, C.L.; Jones, K.W.; McGill, J.A.; Bryan, M.A.; Moore, C.F.; Gilman, R.; Glashausser, C.; Seestrom-Morris, S.J. (Los Alamos National Lab., NM, USA; Texas Univ., Austin, USA; Pennsylvania Univ., Philadelphia, USA; Rutgers - the State Univ., University Park, NJ, USA; Minnesota Univ., Minneapolis, USA). *Physics Letters [Section] B;* **182**: No. 2, 151-154(18 Dec 1986).

Angular distributions of recoil protons in coincidence with the scattered pions from the reaction (π/sup +/,π/sup -/p) on targets of /sup 12/C and /sup 48/Ca are reported. The measurements were made at an incident pion energy of 250 MeV, for a scattered pion angle of 80/sup 0/ and energy of 139 MeV. The angular distribution of recoil protons is broader than expected from a model in which the reaction is assumed to proceed by two sequential pion charge-exchange scatterings from nucleons in a Fermi gas.

17213 **(FEI—1722) Measurement of inelastically scattering neutron spectra from the (n,n'γ) reaction on iron nuclei.** Lychagin, A.A.; Devkin, B.V.; Zhuravlev, B.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1985. 17p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700699.

The time-of-flight method was applied to measure spectrum of inelastically scattered neutrons in coincidence with 0.845 MeV γ-quanta at initial energy of neutrons equal to 14.1 MeV. Corrections necessary for processing experimental results and obtaining neutron from the reaction /sup 56/(n,n'γ)/sup 56/Fe are analyzed. 5 refs.; 7 figs.

17214 (INIS-mf—10558, pp 14) **Neutron scattering on light even-even nuclei.** Schmidt, D.; Seeliger, D. (Technische Univ., Dresden, German Democratic Republic). Jun 1985. NTIS (US Sales Only), PC A03/MF A01. File Number DE87700739. (CONF-850635—Absts.).

From 4. international symposium on neutron induced reactions; Smolenice, Czechoslovakia (17 Jun 1985).

17215 **(ITEF—191(1984)) Secondary particle multiplicity in the π/sup -/Ne interactions at psub(π)=6.2 Gev/c.** Kiselevich, I.L.; Kolesnikov, V.V.; Lapushkin, S.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1984. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700750.

Experimental data on multiplicity of secondary charged particles in π/sup -/Ne interactions at Psub(π)=6,2 GeV/c obtained by means of the 2 m neon-hydrogen ITEP bubble chamber are presented. Calculations of the model of multiple rescatterings are carried out. Comparison of experimental data with predictions of the model points out the necessity of additional accounting of cascade type process. 9 refs.; 3 figs.; 2 tabs.

17216 **(BNL-NCS—38907) Uncertainties in scientific measurements.** Holden, N.E. (Brookhaven National Lab., Upton, NY (USA)). 16 Nov 1986. Contract AC02-76CH00016. 11p. (CONF-861102—36). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004605.

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Some examples of nuclear data in which the uncertainty has been underestimated, or at least appears to be underestimated, are

reviewed. The subjective aspect of the problem of systematic uncertainties is discussed. Historical aspects of the data uncertainty problem are noted. 64 refs., 6 tabs.

17217 **(CENBG-R—8601) Application of the PFIS method to the LISE spectrometer at GANIL: (Experiment beta performed at the GANIL National Laboratory in Caen (France)) beta decay of light neutron rich exotic nuclei.** Hubert, F.; Dufour, J.P.; Del Moral, R. (Bordeaux-1 Univ., 33 - Gradignan (France). Centre d'Etudes Nucleaires). Jan 1985. 16p. (CONF-850173—17). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750476.

From 23. international winter meeting on nuclear physics; Bormio, Italy (21 Jan 1985).

Radioactive studies of light neutron rich exotic nuclei have been performed on the LISE line at GANIL. These isotopes were produced via projectile nuclear fragmentation of 60 MeV/nucleon ^{40}Ar on Be. Physical separation of the nucleides was achieved through the Projectile Fragment Isotopic Separation (PFIS) method (magnetic analysis and differential stopping power effects). At least 8 nuclei were observed for the first time through β-γ coincidence measurements (^{40}S, ^{36}P, ^{37}P, ^{36}Si, ^{35}Si, ^{34}F, ^{23}O) as well as already known half-lives to provide a check of the procedure (^{36}P, ^{30}Mg, ^{32}Al).

17218 **(CRN-PN—84-44) Coulomb displacement energies between analog levels for 44 < = A < = 239.** Antony, M.S.; Britz, J.; Pape, A. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires). Aug 1985. 41p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750454.

Experimental Coulomb displacement energie ΔEsub(C) between isobaric analog levels are tabulated for 44 <- A <- 239, extending recent work in which similar data were presented for 3 <- A <- 45. An overall parametrization in anti-Z/A sup(1/3) and uniform radius parameters rsub(o) are given.

17219 **(GANIL-P—86-02) Search for impact parameter dependence of two-particle correlations using exclusive observables in nucleus-nucleus collisions at intermediate energies.** Ardouin, D.; Delagrange, H.; Doubre, H. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). Jan 1986. 22p. (CONF-860160—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750584.

From 14. international workshop on the gross properties of nuclei and nuclear excitation; Hirschegg, Austria (13 Jan 1986).

The present analyzing status of two light particle correlations combined with exclusive observables from argon induced reactions on gold and titanium targets at 60 MeV/A.

17220 (INIS-mf—10558, pp 15) **/sup 52/Cr(n,xnγ)reactions at 14.6 MeV studied by coincident in-beam techniques.** Hlavac, S.; Oblozinsky, P.; Pivarc, J. (Slovenska Akademia Vied, Bratislava, Czechoslovakia. Fyzikalny Ustav). Jun 1985. NTIS (US Sales Only), PC A03/MF A01. File Number DE87700739. (CONF-850635—Absts.).

From 4. international symposium on neutron induced reactions; Smolenice, Czechoslovakia (17 Jun 1985).

17221 (INIS-mf—10558, pp 17) **Analog giant dipole excitation in /sup 58/Ni(n,p)/sup 58/Co reaction at 17.3 MeV neutron energy.** Rondio, J.; Marianski, B.; Czerski, K.; Korman, A.; Zemlo, L. Jun 1985. NTIS (US Sales Only), PC A03/MF A01. File Number DE87700739. (CONF-850635—Absts.).

From 4. international symposium on neutron induced reactions; Smolenice, Czechoslovakia (17 Jun 1985).

17222 **Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements.** Wohlfahrt, H.D.; Shera, E.B.; Hoehn, M.V.; Yamazaki, Y.; Steffen, R.M. (Los Alamos Scientific Lab., NM). *Physical Review [Section] C: Nuclear Physics;* **23**: No. 1, 533-548(Jan 1981).

Precise 2p-1s muonic x-ray transition energies and energy shifts were measured for the 1integral/sub 7/2/-shell nuclei /sup 39,41/K, /sup 40,42,43,44,46,48/Ca, ^{45}Sc, /sup 46,47,48,49,50/Ti, ^{51}V, /sup 50,52,53,54/Cr, ^{55}Mn, and ^{56}Fe. The data were analyzed in terms of the Barrett moments <r/sup k/e$^-$/sup ar/> of the nuclear charge distribution, from which equivalent nuclear radii R/sub k/ and isotopic and isotonic differences ΔR/sub k/ were computed. For those nuclei for which electron-scattering data were available, model-independent rms radii and radius differences were deduced from a combined analysis of the present data and elastic electron-scattering data. The ΔN = 2 isotope shifts between even-A nuclei decrease nearly linearly with increasing N and become negative in the second half (24 ≦ N ≦ 28) of the 1integral/sub 7/2/ shell; a strong shell-closure effect is evident at N = 28. The isotope shifts are independent of Z, suggesting that the added neutrons interact with the entire proton core rather than with the valence protons. The ΔZ = 2 isotone shifts between even-A nuclei decrease smoothly and uniformly with increasing Z for 20 ≦ Z ≦ 28 and are essentially independent of N. Like the isotope shifts, the isotone shifts display a sudden increase at Z = 28. Both the ΔN = 1 isotope shifts and the ΔZ = 1 isotone shifts show pronounced odd-even staggering. A strong correlation is found between nuclear deformation, as revealed by experimental B(E2) values, and the measured isotope and isotone shifts. The measured isotope and isotone shifts, including those for odd-A nuclei, are satisfactorily described by a simple empirical formula. The experimental results were compared with Hartree-Fock calculations; some calculations that include ground-state correlations display improved agreement with experiment through the inclusion of these deformation-related effects.

17223 **Muonic isotope shifts in the stable Ca nuclei.** Wohlfahrt, H.D.; Shera, E.B.; Hoehn, M.V.; Yamazaki, Y.; Fricke, G.; Steffen, R.M. (Los Alamos Scientific Lab., NM). *Physics Letters [Section] B;* **73B**: No. 2, 131-134(13 Feb 1978).

Precise isotope shifts of the 2p - 1s muonic transition energies for the stable Ca isotopes have been measured. Model-independent radius differences are derived from combined analysis of the present data and elastic scattering data. The precise new /sup 48-40/Ca isotope shift disagrees with Hartree-Fock predictions. 19 references, 2 figures, 2 tables.

17224 **Muonic isotope shifts in the even Fe nuclei.** Shera, E.B.; Ritter, E.T.; Rinker, G.A. Jr.; Bennett, M.J.; Perkins, R.B.; Wohlfahrt, H.D.; Fricke, G.; Wagner, L.K.; Kleinheinz, P.; Sheline, R.K.; Steffen, R.M. (Univ. of California, Los Alamos). *Physical Review Letters;* **34**: No. 9, 535-538(3 Mar 1975).

Isotope shifts of the 2s → 1s muonic transition energies in /sup 54, 56, 58/Fe have been measured. The results indicate that the charge radii of these isotopes vary approximately as A/sup 1/3/. Whereas spherical Hartree-Fock calculations can account for less than one third of the observed isotopes shifts, deformed Hartree-Fock results reproduce two thirds of the observed shifts. It is suggested that the remaining discrepancy is primarily due to neglected neutron-proton residual interactions. 7 references, 1 figure, 2 tables.

6516 Nuclear Properties And Reactions, A=59-89, Experimental

17225 **(IAE—4132/2) Application of hot spot conception to analysis of spectra from reactions with light bombarding nuclei.** Korsheninnikov, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1985. 32p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700706.

Data collection on the "hot spot" formation in nucleus-nuclear collisions and light particle emission from it is obtained. Some indications of the "hot spot" existence are received in the course of experimental data analysis - yield cross section of pre-equilibrium neutron escaping forward and spectra of light particles at backward angles. Calculations through the "hot spot" mechanism are compared with spectra. The forecast in respect to correlation experiment which may be considered as a critical one for the "hot spot" conception is drawn. 36 refs.; 7 figs.; 2 tabs.

17226 **(KIYI—85-31) Results of underground experiment of neutrinoless double beta-decay of /sup 76/Ge.** Zdesenko, Yu.G.; Kropivyanskij, B.N.; Kuts, V.N.; Nikolajko, A.S.; Tretyak, B.I. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 9p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700837.

The experiment is carried out in the underground laboratory in salt mine at the depth of 43 Om from the earth surface. Ge(Li) detector 35 cm/sup 3/ in volume is shielded by mercury, lead and polyethylene layers. The background level at energy of 2β-decay of /sup 76/Ge (2040.7 keV) is (1.7 +- 0.5) x 10/sup -4/ counts/h keV. The processing of data per 1478 hour measurements makes it possible to define that the half-life of 2β-decay of /sup 76/Ge at 68% confidence level is more than 1.1 x 10/sup 22/ years for neutrinoless mode. 17 refs.; 6 figs.; 3 tabs.

17227 **(CEA-CONF—8503) Evolution of the fusion like process around the Fermi energy.** Pollacco, E.C.; Cassagnou, Y.; Alarja, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). May 1986. 4p. (CONF-860506—10; CEA-DPH-N-S—2355). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750589.

From International conference on heavy ion nuclear collisions in the Fermi energy domain; Caen, France (12 May 1986).

The study of evaporation residue from the Ne + Ag system shows that there is qualitative change in the reaction mechanism in the Fermi energy domain. At 20 MeV/u the projectile is mostly absorbed by the target, while at 30-37 MeV/u a continuous range of mass transfer with a large transverse momentum is observed.

17228 **(CENBG—8528) Structure effects in (n,α) reactions on Nd and Zr isotopes.** Augustyniak, W.; Glowacka, L.; Jaskola, M.; Turkiewicz, J.; Zemto, L.; Gadioli, E.; Gadioli Erba, E.; Dalmas, J. (Bordeaux-1 Univ., 33 - Gradignan (France). Centre d'Etudes Nucleaires). 1985. 7p. (CONF-8506120—3). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750451.

From 4. international conference on nuclear reaction mechanisms; Varenna, Italy (10 Jun 1985).

The investigation of effects related to the structure of nuclei in (n,α) reactions might provide useful information for elucidating the reaction mechanism. In this article are presented studies on (n,α) processes on ^{143}Nd^{144}Nd and on ^{90}Zr^{91}Zr.

17229 **(INIS-mf—10282) Ground-state proton radioactivity in the region of neutron-deficient nuclei above the tin.** Gillitzer, A. (Technische Univ. Muenchen, Garching (Germany, F.R.). Fakultaet fuer Physik). 23 Jul 1985. 81p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE87750523.

With a 250-MeV /sup 58/Ni beam at the post-accelerator SchweIN /sup 58/Ni, /sup 54/Fe, and /sup 50/Cr targets were irradiated. In the reaction with /sup 58/Ni delayed protons in a line at an energy of (0.98 +- 0.08) MeV were observed with a half-line of (33 +- 77) μs. In the irradiation of the /sup 54/Fe target a further delayed proton line was found for which an energy of (0.83 +- 0.08) MeV and a half-life of (109 +- 17) μs was measured. The intensity of the proton lines corresponds to nearly equal production cross sections of 30 μb respectively 40 μb. In the reaction /sup 58/Ni+/sup 50/Cr in a sensitive energy range between 0.5 MeV and 1.5 MeV at an experimentally accessible window in the half-life between about 10 ns and 5 s no delayed protons were observed. Thereby a detection limit of 0.5 μb was reached. The proton radioactivities were because of the analysis of the Q/sub p/-value systematics, the quantity of the cross sections, and the comparison of the results of all three reactions assigned to the residual nuclei of the (p2n) evaporation channel /sup 113/Cs respectively /sup 109/I. For /sup 105/Sb under the condition of a pure d/sub 5/2/ ground state a range between 0.55 and 1.1 MeV in the decay energy could be excluded.

17232 **(JINR—6-84-819) Probabilities of electromagnetic transitions in odd thulium nuclei.** Adam, I.; Alikov, B.A.; Askarkhodzhaev, A.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1985. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700765.

Submitted to the journal Bull. Acad. Sci. USSR, Phys. Sci. .

Lifetimes of /sup 165/Tm excited states at 129.9, 315.5, 362.3 and 419.8 keV have been measured by means of delayed $\gamma\gamma$-coincidences in the /sup 165/Yb decay. The following half-lives unknown so far were obtained: Tsub(1/2) (129 keV) $<=$0.2 ns, Tsub(1/2) (315 keV)=0.25(10) ns, Tsub(1/2) (362 keV)$<$0.2 ns and Tsub(1/2) (419 keV)$<=$0.1 ns. Probabilities of M1, E2, E1 intra- and interband γ-transitions have been obtained on the basis of the known from literature obtained on the excited states of Tm isotopes. Behaviour of probabilities of M1, E2 and E1 transitions in Tm isotopes has been analysed in adiabatic approach for ground state bands, and also within the framework of the nonadiabatic description of electromagnetic transition probabilities. The influence of pairing correlations on probabilities of E1(ΔK=0) transitions has been discussed as well as the role of K-mixing in calculations of K-forbidden E1(ΔK=3) transitions. Results of the analysis has shown that it is possible to describe rather well a great number of resolved and K-forbidden electromagnetic transitions in the framework of the nonadiabatic rotational model. Consideration of quasiparticle-phonon interaction allows one to improve appreciably agreement of the results with the experiment. 36 refs.; 5 figs.; 9 tabs.

Published in summary form only.

17234 **(CENBG—8602) Two-particle correlations in ^{40}Ar + ^{197}Au at 60 MeV/A.** Quebert, J. (Bordeaux-1 Univ., 33 - Gradignan (France). Centre d'Etudes Nucleaires). Jan 1986. 18p. (CONF-860158—6). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750452.

From 25. international meeting on nuclear physics; Bormio, Italy (20 Jan 1986).

Two-particle correlations have been measured at GANIL with a multidetector array of 21 telescopes (a part of which was set-up in a close-packed geometry). Simultaneously a plastic wall, made of 96 scintillators, set-up at foward angles, was triggered

either by coincidence events or single events. The correlation functions R, are measured for different sets of light particles. They are also studied versus collective data given by the plastic wall detection of each event. We deduce different informations concerning the spatial extent of the emitting source, as well as the population of particle unstable states of light nuclei.

17235 **(CONF-8605150—3) High-spin states and coexisting states in the Pt-Au transition region.** Riedinger, L.L.; Carpenter, M.P.; Courtney, L.H.; Janzen, V.P.; Schmitz, W. (Tennessee Univ., Knoxville (USA)). 1986. Contract AS05-76ER04936. 7p. NTIS, PC A02. File Number DE87005498.

From Beijing symposium on physics at tandem; Beijing, China (26 May 1986).

High-spin states in the N = 104 to 108 region have been studied by in-beam spectroscopy techniques in a number of Ir, Pt, and Au nuclei. These measurements have been performed at tandem Van de Graaff facilities at the Oak Ridge National Laboratory and at McMaster University. Through comparison of band crossings in a variety of odd-A and even-A nuclei, we are able to assign the first neutron and first proton alignment processes, which are nearly degenerate for ^{184}Pt. These measurements yield the trend of these crossing frequencies with N and Z in this region. Knowledge of this trend is important, since these crossing frequencies can give an estimate of how the shape parameters vary across this transitional region. 22 refs., 7 figs., 1 tab.

17236 **(GANIL-P—86-12) Multiplicity dependent light particle correlations in ^{40}Ar + ^{197}Au reaction at E/A = 60 MeV^0.** Kyanowski, A.; Saint-Laurent, F.; Ardouin, D. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). 1986. 12p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750582.

Correlations between light particles in ^{40}Ar induced reactions on ^{197}Au at E/A = 60 MeV have been measured in coincidence with a multidetector system. The correlations decrease monotonously with increasing charged particle multiplicity. With the help of a participant-spectator model, this multiplicity is tentatively connected to the impact parameter. The correlation function is analyzed in the framework of the final state interaction model in order to extract the space-time extent of the emitting source.

From 4. international symposium on neutron induced reactions; Smolenice, Czechoslovakia (17 Jun 1985).

17238 **(ITEP—118(1985)) Correlations between neutrons with small relative momenta produced in p-Pb interactions at 7,5 GeV/c.** Bayukov, Yu.D.; Degtyarenko, P.V.; Efremenko, Yu.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 11p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700752.

Correlations between neutrons with small relative momenta have been studied in p-Pb interactions at 7.5 GeV/c. The 10-100 MeV neutrons emerging at the angles of 75-90 degrees with respect to the beam direction were recorded. Two-neutron final-state interaction effect carrying information about space-time characteristics of a neutron source has been observed. Magnitude of the effect has been found to depend on the mean neutron momentum in the pair. As the spatial extent of the neutron source is assumed to be limited by the size of the target nucleus, the source lifetime has been found to decrease with the increasing mean neutron momentum. This fact is explained by considerable contribution of the evaporation process to the emission of slow secondaries. 21 refs.; 3 figs.

17239 **(BNL—38491) Energy dependence of the neutron multiplicity P/sub nu/ in fast neutron induced fission of /sup 235,238/U and ^{239}Pu.** Zucker, M.S.; Holden, N.E. (Brookhaven National Lab., Upton, NY (USA)). 1986. Contract AC02-76CH00016. 36p. (CONF-860610—34). NTIS, PC A03/MF A01; GPO Dep. File Number DE86015078.

From American Nuclear Society annual meeting; Reno, NV, USA (15 Jun 1986).

Certain applications require knowledge of the higher moments of the neutron multiplicity probability. It can be shown that the second factorial moment is proportional to the fission rate in the sample, and that the third factorial moment can be of use in disentangling spontaneous fission from induced fission. Using a source of unpublished work in which neutron multiplicities were derived for the fast neutron induced fission of U-235, U-238, and Pu-239, the multiplicity probability has been calculated as a function of neutron energy for the energy range 0 to 10 MeV. From Symposium on the many facets of heavy ion fusion reactions; Argonne, IL, USA (24 Mar 1986).

The aim of the present investigation is to determine the entrance channel conditions to form nuclei as hot as possible and also to study their decay properties. The experiment has been realised at the GANIL facility using ^{14}N, ^{40}Ar, and ^{58}Ni projectiles at intermediate energies and with beam intensities ranging from 100 to 500 nA. The technique we used to determine the linear momentum imparted to the target nucleus is the angular correlation of the fission products, whereas energies deposited in nuclei were deduced from the measurement of masses and velocities of both fission fragments. In summary, important amount of momentum transfers and excitation energies have been imparted to composite-like-nuclei with A approximately 270. A scaling for momentum transfer with the projectile mass is evidenced up to the Ni ions for central collisions. Velocity and size of projectiles play an important role as well as excitation energies deposited in fissioning nuclei, in fixing the central collision cross sections. Finally, high relative velocities of fission fragments have been measured and open an interesting problem on the fission properties of nuclei at high excitation energies and angular momenta.

17241 **(CEA-CONF—8440) Formation and decay of hot nuclei.** Mostefai, M.; Cassagnou, Y.; Conjeaud, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Fondamentale (IRF)). May 1986. 4p. (CONF-860506—8; CEA-DPH-N-S—2347). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750448.

From International conference on heavy ion nuclear collisions in the Fermi energy domain; Caen, France (12 May 1986).

Fission fragment angular correlations for the system ^{58}Ni + ^{232}Th at 20, 25 and 30 MeV/u show still a bump for large momentum transfers which suggest that its disappearance for the ^{40}Ar + ^{232}Th system at 44 MeV/u is not due to a limitation in the excitation energy and that the size and velocity of projectiles are also important. High relative velocities of fission fragments are measured for large transfers (approximately 9.5 GeV/c), this could be due to more exotic fission of hot nuclei.

17242 **(CONF-8609159—6) Competition between fusion and quasi-fission in heavy ion induced reactions.** Back, B.B. (Argonne National Lab., IL (USA)). Sep 1986. Contract W-31109-ENG-38. 24p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004983.

From International school-seminar on heavy ion physics; Dubna, USSR (23 Sep 1986).

Quantitative analyses of angular distributions and angle-mass correlations have been applied to the U + Ca reaction to obtain upper limit estimates for the cross sections for complete fusion near or below the interaction barrier. Extrapolating to the systems Ca + Cm and Ca + Es using the well established scaling properties of the extra push model, an estimate of the cross sections relevant to the efforts of synthesizing super-heavy elements in the region Z = 116 and N = 184 via heavy-ion fusion reactions are obtained. A simple evaporation calculation using properties of the super heavy elements shows that the failure to observe super-heavy elements with the Ca + Cm reaction is consistent with estimates of the complete fusion process. 33 refs., 9 figs., 1 tab.

From Symposium on the many facets of heavy ion fusion reactions; Argonne, IL, USA (24 Mar 1986).

A review of the linear momentum transfer is made, considering essentially heavy targets and two important parameters in the entrance channel: the projectile energy and its mass. Over a broad mass range, and for energies up to 30A MeV, the momentum transfer scales with the mass of the projectile. At 30A MeV, the most probable value of projectile momentum transferred to the fused system is 80%, and this represents roughly 180 MeV/c per projectile nucleon. At higher bombarding energies, the momentum distribution in the fused systems, as observed from binary fission events, seems to depend on the mass of the projectile. Further studies are still needed to understand this behaviour. Finally, the decay of highly excited (E^* approximately 500-800 MeV) fused systems, with masses close to 270 amu, is studied from the characteristics of both fusion fragments and light charged particles. It is shown that thermal equilibrium is reached before fission, even for such high energy deposition. However, the decay sequence is sensitive to dynamical effects and does not depend only on available phase space.

A setup for neutron scattering and total cross-section measurements by using high flux filtered reactor beams was created at the WWR-M reactor of the Institute for Nuclear Research in Kiev. Scattering neutrons are detected by a hydrogen proportional proton recoil counter. Total neutron cross-sections are measured by transmission. The measured total neutron cross-sections of carbon, lead and uranium-238 at 55 keV, 144 keV neutron energy are given. Filtered neutrons were got by means of silicon filter. Total and differential neutron scattering cross-sections of /sup 238/U both elastic and inelastic at 144 keV neutron energy are given. 5 figs.; 15 figs.; 1 tab.

(CEA Centre d'Etudes de Bruyeres-le-Chatel, 92 - Montrouge (France)). Nov 1985. 14p. (In French). (CONF-851157—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750439.

From Specialists' meeting on the use of the optical model for the calculation of neutron cross sections below 20 MeV; Paris, France (13 Nov 1985).

During the past ten years, a large amount of experimental data has been accumulated which gives information with regard to the sizes of the nucleus and the distribution of nuclear matter. Some particularly relevant results are presented. From a theoretical point of view, the contribution of the microscopic models is shown and particularly the results obtained by Hartree-Fock (HF) and Hartree-Fock-Bogoliubov (HFB) methods using D1 effective interaction. The limitations of static calculations are also shown making necessary to take into account the dynamical effects, especially in shape transition regions. The densities obtained by the HF + RPA and HFB + Bohr hamiltonian theories are presented and compared to the experimental results.

17254 (CNIC—00006) Calculation of the reaction cross sections of neutrons on /sup 10/B, /sup 11/B by using optical model and Hauser-Feshbach theory. (China Nuclear Information Centre, Beijing, BJ). Apr 1986. 12p. (In Chinese). (IAE—0006). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701276.

The reaction cross sections of neutron on /sup 10/B, /sup 11/B were calculated by using optical model and Hauser-Feshbach theory. The total cross sections, elastic scattering cross sections and angular distributions, the inelastic scattering cross sections and angular distributions of low excitation state of the 9.72 MeV neutrons on /sup 10/B and 9.97, 12.06, 14.10, 18.12 MeV neutrons on /sup 11/B, and the reaction cross sections and angular distribution of (n, p), (n, d), (n, t) and (n, α) reactions, as well as the branching ratio of /sup 11/B(n, α/sub 0/) /sup 8/Lisub(g. s.) and /sup 11/B(n, α/sub 1/) /sup 8/Lisub(ist) were obtained. The optical parameters of α particles on the short-life /sup 8/Li were deduced. The calculation results were compared with the experimental data.

17255 (CNIC—00007) Measurement of thermal-neutron-induced /sup 235/U fission spectrum by threshold detectors. (China Nuclear Information Centre, Beijing, BJ). Apr 1986. 13p. (In Chinese). (IAE—0007). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701277.

The unfolding spectrum capacity of SAND-II and RDMM methods was investigated using threshold detectors to determine the thermal neutron induced /sup 235/U fission spectrum. A Monte Carlo error analysis code was used to analyse the input data errors. The errors of solution uniqueness for SAND-II and the effect of the weighting function for RDMM have been discussed. The sensitivity of both methods for the structure of the unknown spectra has been tested briefly. The results showed that SAND-II and RDMM are better methods for determinating the fast neutron spectra with smooth variation. The SAND-II is more suitable for unknown spectra with simple structure.

17256 (CONF-861193—4) Covariances for measured activation and fission ratios data. Smith, D.L.; Meadows, J.W.; Watanabe, Y. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 15p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004748.

From IAEA specialists' meeting on covariance methods and practices in the field of nuclear data; Rome, Italy (17 Nov 1986).

Methods which are routinely used in the determination of covariance matrices for both integral and differential activation and fission-ratios data acquired at the Argonne National Laboratory Fast-Neutron Generator Facility (FNG) are discussed. Special consideration is given to problems associated with the estimation of correlations between various identified sources of experimental error. Approximation methods which are commonly used to reduce the labor involved in this analysis to manageable levels are described. Results from some experiments which have been recently carried out in this laboratory are presented to illustrate these procedures. 13 refs., 1 fig., 5 tabs.

17257 (CONF-8610164—2) Neutron scattering on nuclei near A = 60 and A = 90. Lawson, R.D.; Smith, A.B. (Argonne National Lab., IL (USA)). 10 Oct 1986. Contract W-31-109-ENG-38. 26p. NTIS MF A01; 2; GPO Dep. File Number DE87004962.

From International Atomic Energy Agency conference; Bologna, Italy (6 Oct 1986).

Over a wide range of incident energies, the total cross section and angular distributions for elastic scattering of neutrons from nuclei in these mass regions are analyzed using the spherical-optical-statistical model. The effect of a real-surface-peaked potential, predicted by dispersion relations, is considered. It is found that when the data on a given nucleus between say, 4.5 and 10 MeV, are analyzed simultaneously one obtains a smooth energy variation of the optical model parameters. Moreover, this parameterization may be used to predict, quite accurately, at least the total cross sections up to 20 MeV. The parameters characterizing the model are quite different in the two mass regions. However, a comparison of the optical model results for (^{89}Y and ^{93}Nb indicates that near A = 90 the real well parameters are nearly the same for the two nuclei and that the volume integrals of the imaginary potentials are similar. 16 refs., 9 figs., 2 tabs.

17258 (DOE/ER/40154—3) Research in theoretical nuclear physics: Annual report, 1985/1986. Liu, K.F. (Kentucky Univ., Lexington (USA)). 1986. Contract FG05-84ER40154. 24p. NTIS, PC A02. File Number DE87005520.

Investigations are proposed in the following areas: Chiral soliton description of hadron physics, Monte Carlo lattice gauge simulation, detection of quark gluon plasma in relativistic heavy ion collisions, phenomenology of exotic mesons and fermi-liquid theory of nuclei. An effective σ model lagrangian is used to study the nucleon static properties, the NN static potential and the baryon spectrum with vibration and rotation coupling in πN scatterings. In the projects involving Monte Carlo calculations, plans are made to evaluate the vacuum to glueball transition amplitudes and the nucleon form factors in the physical SU(3) case. Calculations are made of the ionization and regeneration rates of various high mass mesons to examine a proposal of detecting the quark gluon plasma via di-leptons and quadra-leptons. Efforts continue in searching for exotic mesons (Q^2 anti Q^2 mesons and glueballs in $\gamma\gamma$ reactions, hadronic collisions, J/psi radiative decays and anti NN annihilations. Last but not least, a proposal is made to employ a new Skyrme interaction to study the spin modes in nuclei, the particle-particle interactions, the optical potentials and carry out the renormalized random phase approximation calculations via particle-phonon coupling mechanism. 73 refs., 1 fig.

17259 (EFI—781(8)-85) Electron scattering from light nuclei in the regions of quasi-elastic peak and Δ-isobar excitation. Aznauryan, I.G.; Troshenkova, I.A. (Erevanskij Fizicheskij Inst. (USSR)). 1985. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700676.

The cross sections of the (e,e') reaction on nuclei are considered in the identical form for the quasi-elastic electron scattering and the quasi-free pion electroproduction. The cross sections on single nucleon in the Δ-isobar excitation region are obtained using the dispersion relations being in good agreement with the experiment. A consistent set of parameters for the shell model with the oscillator potentials is obtained for Li, Be, C, Mg, Al and Si nuclei. The mean square radii of the nuclei charge distribution calculated with the use of these parameters agree with the rms obtained from the electron-nuclei elastic scattering experiments. 20 refs.; 5 figs.

17260 **(GANIL-P—86-08) Particle emission but also fission in the decay of very excited nuclei.** Delagrange, H.; Gregoire, C.; Abe, Y.; Carjan, N. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)). 1986. 12p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750590.

An extension of the statistical model for the study of very excited nuclei is presented. The temperature and angular momentum dependences of the fission barriers are obtained in a liquid drop picture. It provides us with the relevant potential landscapes for some collective variables which evolve during the decay according to a generalized transport equation. The light particle evaporation during the fast fission process and the fission after compound nucleus formation is calculated and compared with some available experimental results, e.g. for $^{40}Ar + ^{238}U$ at 27 MeV/u. The competing process of particle emission (cooling) during the thermal equilibrium prevents a complete transfer of excitation energy along the whole evolution of the system. Such nuclei should be called warm instead of hot.

17261 **(GSI—86-32-Prepr.) Sub-barrier fusion.** Reisdorf, W. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Aug 1986. 23p. (CONF-860802—6). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750500.

From International nuclear physics conference; Harrogate, UK (25 Aug 1986).

Measured fusion excitation functions in the vicinity of the barrier reveal nuclear structure effects, due in particular to the coupling of the fusion process to direct-reaction channels.

17262 **(IFVE-OTF—85-112) Do multinucleon clusters exist in a nucleus.** Smirnov, A.Yu. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 7p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700728.

Submitted to the journal Pis'ma Yad. Phys. .

A Method of extracting nuclear constituent masses by compairing the structure functions of a nucleus and of a free nucleon is proposed. It is shown that the existing data do not confirm the significant admixture of multinucleon clusters in a nucleus. At the same time, these data do not contradict the nucleon color oscillation model. 3 refs.; 3 figs.

17263 (INIS-mf—10556-Vol.1, pp 76-83) **Dynamic symmetries in nuclei and molecules.** Iachello, F. (Yale Univ., New Haven, CT, USA. Wright Nuclear Structure Lab.). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

A survey is published of the use of the concepts of dynamic symmetries for the description of spectra of complex atomic nuclei and the description of molecular spectra. In nuclear physics the application is based on the interacting boson model (IBM). In molecular physics it is based on the so-called vibron model whose algebraic structure is similar to the IBM structure but whose physical interpretation is completely different (molecular spectra are characterized by dipole deformation, nuclear spectra by quadrupole deformation). The extension of these ideas is mentioned to comprise mixed systems of bosons and fermions in nuclear physics (odd nuclei) and in condensed matter physics (superconductivity). (S.P.).

In Experimental and theoretical physics. Collection.

Calculations of reaction cross sections under the action of protons on /sup 12/C, /sup 40/Ca, /sup 90/Zr, /sup 120/Sn, /sup 208/Pb nuclei are performed at 40-1000 MeV energies in the frame-fork of the optical model with provision for noneikonal effects. The obtained cross sections are compared with precise calculational results. Relative Coulomb correction is close to the W/E factor (where W is the Coulomb barrier), usually used for consideration of the Coulomb interaction contribution to reaction cross section. The results obtained show that nuclear noneikonal correction is to be taken into account along with the Coulomb one, in particular for intermediate mass nuclei.

17283 (INIS-SU—370, pp 49-52) **Quasi-free scattering of pions on nuclei in the region of Δ/sub 33/-resonance.** Zavarzina, V.P.; Sergeev, V.A.; Stepanov, A.V. (AN SSSR, Moscow. Inst. Yadernykh Issledovanij). 1984. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87780078.

In Experimental and theoretical physics. Collection.

Differential cross sections of direct knock out of nucleons by pions and quasi-free scattering of pions on nuclei at enegries above Δ/sub 33/ resonance are calculated and compared with experimental values. Calculated cross sections describe available experimental data with provision for introduced approximations and also the errors, related to separation of contributions of direct knock out and quasi-free scattering from measured values. The mechanism of quasi-free scattering dominates (constitutes 65-70%) in the (π/sup +/π/sup +1/) inclusive reaction at Esub(π)=245 MeV for all nuclei under study, while the contribution of the processes of direct knock out decreases with A growth.

17284 (INIS-SU—370, pp 58-61) **Energy spectra of secondary electrons with E>100 MeV at altitudes of 300-500km for shells of L=2-4.** Kurnosova, L.V.; Razorenov, L.A.; Fradkin, M.I. 1984. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87780078.

In Experimental and theoretical physics. Collection.

Problem of secondary electrons energy spectra obtained from measurings at heights of 300-500 km for shell of L=2-4 is considered for the energy range of 100-1000 MeV. It is shown that there are some captured electrons forming under the action of primary cosmic rays at heights of 300-500 km in a rarefied medium. The flux of captured electrons is approximately equal to the albedo electron flux generated at stratosphere heights.

17285 (INS—553) **Isoscalar quadratic energy weighted sum rules and quadrupole moment of giant quadrupole resonance.** (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study). Aug 1985. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701315.

Isoscalar sum rules homogeneous quadratic in energy weighting are derived for the electric multipole operators. Except for scaling factors the sum rule values for the pure quadrupole and monopole transitions are the same as that for the corresponding linear energy weighted sum rules. Through these sum rules the electric quadrupole moment of giant quadrupole resonance is found to be -2.7 Asup(1/3) efm/sup 2/.

From Winter school on fundamental nuclear physics; Trieste, Italy (7 Feb 1984).

I will therefore try to a large extent to concentrate on more formal aspects of the theory not treated in the standard literature. Numerical applications and comparison with experiments can also be found in the complementary lectures.

17287 (ITEP—154(1985)) Quarks degrees of freedom and deuteron static moments. Kalashnikova, Yu.S.; Narodetskij, I.M.; Veselov, A.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 24p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700755.

The probability of the six-quark bag part of the deuteron is defined within recently formulated quark compound bag (QCB) model.An upper limit of about 1% for admixture of the confined bag in the deuteron is found for the QCB potential supplied by the long range Paris interaction. The six-quark bag corrections to the static multipole moments of the deuteron are estimated to be < or approximately 1% for μsub(α) and < or approximately 6% for Qsub(d). 16 refs.; 4 figs.; 2 tabs.

17288 (ITP—85-117-E) Phenomenologic consideration of quark degrees of freedom in potential description approach. Petrov, N.M. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1985. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700762.

Potential description of an interaction in a system of two hadrons with their internal structure taken into account is discussed. The interaction parameters are estimated in the region of a compound quark bag. The problem of underboundness in few-nucleon systems and the scattering by resonance levels are discussed. 18 refs.; 1 fig.

17289 (JINR—E-2-85-748) Excitation of target residues in the firestreak model. Avdejchikov, V.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1985. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700777.

The nuclear firestreak model is used to calculate the excitation energy of residual nuclei in nucleus-nucleus collisions. The incorporation of diffuseness of interacting nuclei has introduced the dependece of nucleus excitation on the energy of the projectile. Viscosity of nuclear matter is also taken into account. "Nuclear thermometer" is proposed to measure the temperature of target residues. 27 refs.; 4 figs.

17290 (JINR—E-4-85-706) Quasiparticle-phonon nuclear model. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701329.

Submitted to the International school on nuclear structure (Alushta, 1985).

Basic assumption of the quasiparticle-phonon nuclear model (QPNM) and its two applications are presened. The introduction of tensor forces in the QPNM is described and the results of studying the fragmentation of charge-exchange resonances in spherical nuclei are given. The low-lying Ksup(π)=0sup(+), 2/sup +/, 3/sup +/ and 4/sup +/ states in doubly even deformed nuclei are described. The results calculated in the QPNM are compared with those obtained in the interacting boson model. 52 refs.; 4 figs.

17291 (JINR—E-4-85-728) Investigation of two-phonon pole shift in deformed nuclei by the boson expansion method. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 8p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701330.

Submitted to the journal Theor. Math. Phys. .

New phonons are constructed by the boson expansion method. The model Hamiltonian is expressed through the new phonon operators up to the forth order terms. The two-phonon pole shift is calculated. It coincides up to the main terms with that calculated with the phonons calculated in random phase approximation and strict inclusion of the Pauli principle. It is concluded that the two-phonon collective states in the even-even deformed nuclei are absent. 16 refs.

17292 (JINR—E-7-85-431) Half-lives and kinetic energies for the spontaneously emitted heavy ions from nuclei. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1985. 140p. NTIS (US Sales Only), PC A07/MF A01. File Number DE87701331.

The partial half-lives, branching ratios relative to the alpha-decay, kinetic energies and Q-values for the most probable spontaneously emitted heavy ions from 766 nuclides with Z=47-106 and total half-lives longer than 1 μs are estimated by using the analytical superasymmetric fission model, a semiempirical formula for α-decay life-time, which are not measured, and the Wapstra-Audi new mass tables. Even the so-called stable nuclides with Z>40 are metastable relative to the new decay modes. The experimental evidences are briefly reviewed. 43 refs.; 3 tabs.

17293 (JINR—R-7-86-6) Study of cluster emission by excited compound nuclei. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1986. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701166.

From Workshop on 4π-detector for Heavy ion reaction products (FOBOS installation); Dubna, USSR (1986).

Submitted to the journal Sov. J. Nucl. Phys. .

On the basis of the evaporation model calculations have been done for the cross sections of cluster formation in the decay of excited compound nuclei with Z = 49, 65, 80 and 97 formed in the reactions Ag + He/sup 3/ in the He/sup 3/ ion energy range between 50 and 130 MeV and in the reactions Arsup40 + Ag, Arsup40 + Sm(154) and Arsup(40) + Ausup(197) at an Arsup(40) ion energy of 336 MeV. The influence of various factors (shell effects in the level density, changes in the angular momentum and in the equilibrium deformation in cluster emission, etc) on the cluster emission cross section has been considered in detail. Good agreement between the calculated results and experimental data has been obtained without using the additional factors associated with the probability of cluster formation in compound nuclei. 15 refs.; 6 figs.

17294 (JINR-R—2-85-830) Statistical methods of the description of quark degrees of freedom. Baldin, A.M.; Shumovskij, A.S.; Yukalov, V.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700799.

An investigation of quark degrees of freedom by means of statistical-mechanics methods is illustrated by two examples. In one a possibility for the coexistence of clusters composed of different numbers of quarks is analysed, phase transitions in the model of coexisting multiquark clusters under changes of temperature and nuclear-matter density are studied. It is shown that such temperature and density intervals exist, when it is thermodynamically profitable for a system to pass on a state that is a mixture of nucleons, six-, nine- and even twelve- quark components. In the other example the principle of correlation weakening in the space of relative four-dimensional velocities is established, being analogous to the Bogolubov principle of correlation weakening formulated for the usual space. The validity of the relativistic principle of correlation weakening is based on experimental data on multiparticle production under collisions of nuclei. 32 refs.; 4 figs.

17295 (JINR-R—4-85-876) Closer of the chain of kinetic equation moments and description of the negative-parity collective excitations. Bal'butsev, E.B.; Vajshvila, Z.; Mikhajlov, I.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700803.

It is shown that for a consistent description of the evolution of Jsub(isub(1)isub(2)...isub(n))= ∫rhoxsub(isub(1)xsub(isub(2))...xsub(isub(n))dr vector tensor by means of the kinetic

equation it is necessary to take into account the Fermi surface deformation (FSD) with multipolarity up to rank n. Inclusion of the octupole FSD considerably influence the estimation of the energy of the giant octupole resonance and allows one to describe the low-lying octupole excitations. 11 refs.

17296 **(JINR-R—4-86-115) Basic equations of the quasiparticle-phonon nuclear model for deformed even-even nuclei.** Nesterenko, V.O.; Solov'ev, V.G.; Sushkov, A.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1986. 14p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700804.

The equations of the quasiparticle-phonon nuclear model for the description of nonrotational states in deformed even-even nuclei are given in the general form. The Pauli principle is taken into account in the two-phonon components of the states. 9 refs.

17297 **(KIYI—85-25) Deuteron break up in Coulomb field of nuclei.** Verbitskij, V.P.; Terenetskij, O.K. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1985. 31p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700834.

An influence of electric deuteron breakup on its elastic scattering has been considered in adiabatic approximation. The formulas free of the varied parameters for differential cross-sections of scattering and total cross-sections of deuteron breakup have been obtained in semiclassical approximation. Z- and E-behaviour of total cross-sections of deuteron electric breakup has been investigated. 58 refs.; 11 figs.; 1 tab.

17298 **(LA-UR—86-4264) [International conference and symposium on unified concepts of many-body problems]: Symposium summary.** Garvey, G.T. (Los Alamos National Lab., NM (USA)). 1986. Contract W-7405-ENG-36. 10p. (CONF-8609163—8). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003743.

From International conference and symposia on unified concepts of many-body problems; Stony Brook, NY, USA (4 Sep 1986).

A review is given of the topics presented at the symposium. 12 refs., 5 figs. (DWL)

17299 **(TRI-PP—86-100) SIGMA hypernuclei: A theoretical review.** Gal, A. (TRIUMF, Vancouver, British Columbia (Canada)). Oct 1986. 9p. (CONF-8608135—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE87900322.

From INS international symposium on hypernuclear physics; Tokyo, Japan (20 Aug 1986).

The Σ-hypernuclear data are briefly reviewed and production of continuum states is discussed. Difficulties in relating the structures observed in stopped K^- reactions, and in flight, to Σ-nuclear interaction parameters are mentioned. In particular, the interplay between spin (including spin orbit) and isospin dependence of the ΣN effective interaction is demonstrated by a recent extensive shell-model study of the $^{12}C(K^-,\pi)$ reactions. 22 refs., 9 figs., 2 tabs.

17300 **Probing for Dirac vacuum structure in nuclei.** Auerbach, N.; Goldhaber, A.S.; Johnson, M.B.; Picklesimer, A.; Miller, L.D. (Los Alamos National Lab., NM, USA; Virginia Univ., Charlottesville, USA. Inst. for Nuclear and Particle Physics). *Physics Letters [Section] B;* **182**: No. 3/4, 221-225(25 Dec 1986).

Recent Dirac-equation analyses of nucleon-nucleus interactions indicate weak dependence of the effective potentials on nucleon energy, and suggest that associated with any large nucleus is an 'island' of ≃ 10/sup 3/ discrete negative-energy nucleon bound states. Experimental searches for this structure would be a critical test of the Dirac-equation picture. Possible experiments as well as open theoretical issues are discussed.

17301 **Dispersive effects in low energy pion-nucleus scattering.** Ernst, D.J.; Giebink, D.R.; Johnson, M.B. (Texas A and M Univ., College Station, USA. Dept. of Physics; Los Alamos National Lab., NM, USA). *Physics Letters [Section] B;* **182**: No. 3/4, 242-246(25 Dec 1986).

Dispersive effects on intermediate nucleons and deltas in the pion-nucleon scattering amplitude are shown to be very important for low energy (T/sub π/≦80 MeV) pion-nucleus reactions. The inclusion of this interaction in comparison with familiar three-body approaches is shown to alter the predicted differential cross sections of a first-order optical potential by more than an order of magnitude and total cross sections by more than a factor of four. In the presence of a second-order potential which incorporates the effect of pion true absorption, differential cross sections differ by a factor of more than three and total cross sections by a factor of two. The large effect is caused by the rapid energy dependence of the imaginary part of the two-body amplitude near the elastic threshold.

17302 **Supersymmetry in nuclear physics.** Iachello, F. (A.W. Wright Nuclear Structure Lab., Yale Univ., New Haven, CT). pp 607-622 of Supersymmetry. Dietz, K.; Flume, R.; Gehlen, C.; Rittenberg, V. New York, NY; Plenum Press (1985). (CONF-8408127—).

From NATO advanced study institute on supersymmetry; Bonn, F.R. Germany (20 Aug 1984).

About 10 years ago a new concept (supersymmetry) was introduced in physics. Originally developed for applications in elementary particle physics, this concept has been recently applied to a variety of problems, both in relativistic and non-relativistic physics. Up to now, the only field in which experimental examples of supersymmetries have been found is nuclear physics. Supersymmetry here has been used to classify simultaneously spectra of even-even and odd-even nuclei. In this paper the author briefly reviews applications of supersymmetry considerations to problems in nuclear physics.

17303 **First forbidden beta decay in light nuclei.** Millener, D.J.; Warburton, E.K. (Brookhaven National Lab., Upton, NY 11973). pp 365-376 of International symposium on nuclear shell models. Vallieres, M.; Wildenthal, B.H. Philadelphia, PA; World Scientific Pub. Co. (1984). (CONF-8410144—).

From International symposium on nuclear shell model; Philadelphia, PA, USA (31 Oct 1984).

Beta decay matrix elements for the operators σ . del and σ . r are calculated for eight J/sup +/ 1/n J/sup -/ beta transitions. Results using harmonic oscillator wave functions differ markedly from those using more realistic Woods-Saxon wave functions. A substantial contribution to the σ . del matrix elements from pion exchange currents is required to reproduce the experimental beta decay rates.

17304 **(BARC—1259) SHARDA - a program for sample heat, activity, reactivity and dose analysis.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 41p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87701252.

A computer program SHARDA (Sample Heat, Activity, Reactivity and Dose Analysis) has been developed for safety evaluation of Pile Irradiation Request (PIR) for various nonfissile materials in the research reactor CIRUS. The code can also be used, with minor modifications, for PIR safety evaluations for the research reactor DHRUVA, now being commisioned. Most of the data needed for such analysis like isotopic abundances, their various nuclear cross-sections, gamma radiation and shielding data have been built in the code for all nonfissile naturally occuring elements. The PIR safety evaluations can be readily carried out using this code for any sample in elemental, compound or mixture form irradiated in any location of the reactor. This report describes the calculational model and the input/output details of the code. Some earlier irradiations carried out in CIRUS have been analysed using

this code and the results have been compared with available operational measurements. 7 refs., 4 tables.

17305 **(BARC—1293) Calculation of damage cross section.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 9p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701258.

In radiation embrittlement studies the density of the atomic displacement is an appropriate measure of the damage produced in the material rather than the integrated neutron number fluence. The measured neutron number fluence can be converted to atomic displacement using damage cross sections. A computer programe DAMCROSS was therefore developed for the calculation of damage cross-section. This report gives the damage cross-section for iron and carbon for elastic scattering, inelastic scattering and radiative capture of neutrons.

17306 **(EFI—780(7)-85) Nuclear-optical methods for production of polarized photons with energies of a few hundred GeV.** Ispiryan, K.A.; Ispiryan, M.K. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 20p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700675.

The absorption coefficients of linearly polarized photons passing through a crystal in parallel to its crystallographic planes are calculated. The methods of determination of the obtainable degree of polarization as well as of the intensity losses for the cases when non-polarized photon beams pass through various crystals in parallel to the planes (110) are described. The energy dependence of the thickness of the quarter-wave plate crystals transforming the linear polarization of the beam into circular one is obtained. 21 refs.; 5 figs.; 1 tab.

17307 **(FEI—1548) Temperature dependence of the generalized frequency water spectrum.** (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1984. 25p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701282.

From experimental data on inelastic scattering of slow neutrons by water the generalized frequency spectrum (GFS) of hydrogen atom of water molecule in the 300-600 K temperature range is obtained. The iteration method has been used which is based on adequate comparison of experimental and calculated double-differential cross sections of slow neutrons scattering by water taking into account multiple neutron scattering effects in a sample and spectrometer resolution. A qualitative discussion of GFS temperature dependence using other experimental and calculation data is outlined. 35 refs.; 9 figs.; 1 tab.

17308 **(FEI—1551) Collective excitation of a target by high-density electron beam.** Yudin, G.L. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1984. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700693.

Collective inelastic forced bremsstrahlung in high-density (dsub(c)) electron beam collisions with arbitrary quantum target is considered. For each N/sub 1/ approximately n/sub 0/ (V/Ω)/sup 3/ neiboughring beam electrons excitation amplitudes are superimposed in a coherent manner. For each N/sub 12/ approximately/ sub 0/ (c/νsub(0)ω)sup(3) neiboughring electrons processes of external field quantum absorption and emission coinside (n/sub 0/) is mean electron beam density, V-electron cluster velocity, Ω-excitation frequency, ν/sub 0/-effective number of emitted (absorbed) quanta, ω-electromagnetic wave frequency. Relation of excitation cross-sections of photoabsorbed target at collective effect to total sections for separate beam electrons is g=1+Nc, where effective number of collective scattering electrons. Nc = min (N/sub 1/, N/sub 2/, Nsub(e). In concrete channels of atom excitation collective effects are more convenient for observation for transtions between high-excited states, and also fine or hyperfine structure componets. General relations for effective ion cluster slowing-down in arbitrary medium, generalizing the known Bethe formula, are obtained. Analysis of interferential terms in analogous task at superlight beam motion in a medium shows that collective effects are present in Cherenkov radiation as well, where Nsub(c)=min (N/sub 1/, Nsub(e)). At this multiplier is included in spectral Tamm-Frank distribution. Behaviour of scattering cross-sections of hard electromagnetic radiation on heavy atom and dense plasma electrons is the same. 11 refs.

17309 **(FEI—1554) Investigation of time evolution of leakage neutron spectra from the surface of a molybdenum sphere in the nanosecond range.** Bezhunov, G.M.; Matusevich, E.S.; Dubinin, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1984. 30p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700694.

The technique of experimental investigation of time evolution of neutron spectra in medium in the nanosecond region during a short neutron pulse, using a californium chamber as a statistic pulse neutron source and a multichannel analyzer in the regime of multiple analysis, is considered. The results of investigation of nonstationary neutron spectra of leakage from the surface of the molybdenum sphere in the neutron energy range from 10.5 to 0.4 MeV and within the time interval from 0 to 130 ns are given. Experimental results are given in comparison with the calculation by the kinetic ROZ-V-1 program using group neutron BNAB constants. Considerable difference between calculated and experimental results is observed in the neutron energy range from 2.5 to 0.4 MeV. The difference observed is supposed to be connected with doubtfullness of neutron inelastic scattering constants for molybdenum in the used library. 14 refs.; 5 figs.; 1 tab.

17310 **(FEI—1630) On the method of separation of regions in the framework of the neutron transport theory.** Abramov, B.D.; Shikhov, S.B. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1984. 28p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700695.

The series of algorithms for the method of region separation is suggested and investigated to solve the neutron transport equation in geometrically complex regions. Convergence conditions are explained, convergence rate evaluations are given, and algorithms with the increased convergence rate are detected. These algorithms can be also used as algorithms for convergence acceleration of the iterative process by collisions. 14 refs.

17311 **(IAE—4110/2) Difference equation of neutron thermalization in vibrational-nonequilibrium medium.** Soldatov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1985. 25p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700704.

Neutron thermalization in heavy molecular gas at arbitrary population of vibrational levels of energy is considered. Differential type equation describing stationary spectrum of thermal neutrons in such media is obtained. The solution method is developed and the calculation results are compared with solution of a corresponding integral transport equation. 14 refs.

17312 **(INDC(AUS)—011/LI) Calculation of the energy spread and the average neutron energy of 14 MeV neutrons produced via the T(d,n)/sup 4/He reaction in solid Ti-T targets.** (International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee). Jul 1986. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701290.

A Monte Carlo code was developed in order to calculate the energy distribution profile of 14 MeV neutrons produced via the T(d,n)/sup 4/He reaction with solid titanium-tritium targets. The slowing down and the angular straggling of the deuterons in the target as well as the finite size of the irradiated sample and the neutron source are taken into account. 17 refs, 10 figs, 2 tabs.

17313 (INIS-SU—370, pp 35-39) **Asymptotic solution of transport equation with an arbitrary indicatrix.** Serezhnikov, S.V. (AN SSSR, Moscow. Inst. Yadernykh Issledovanij). 1984. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87780078.

In Experimental and theoretical physics. Collection.

Asymptotic solution of the transport equation with arbitrary scattering indicatrix is obtained in the framework of approximations of forward-ahead and constant total cross section.

17314 (PNL—5500-Pt.4, pp 15-16) **Double differential ionization cross sections.** Toburen, L.H.; DuBois, R.D.; Manson, S.T. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The importance of charged particle track structure on the subsequent chemical and biological processes initiated by ionizing radiation is well recognized. An accurate representation of the detailed track structure relies on an accurate knowledge of the production and transport of secondary electrons. A major task of this program is to understand the mechanisms responsible for secondary electron production such that theoretical techniques can be used to reliably extrapolate cross sections to regions where data are unavailable. These studies involve measurements over as wide a range of experimental parameters as possible to obtain cross section systematics; these data can then be compared to theoretical calculations to better understand the interaction process. The authors have now compiled relatively extensive experimental cross sections for ionization of neon by protons.

17315 (PNL—5500-Pt.4, pp 16-17) **Theoretical single differential cross sections for bare ions.** Miller, J.H.; Wilson, W.E. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Semiempirical models that extend the data base of differential ionization cross sections have proved quite useful in applying these data to radiological atmospheric and plasma physics. In recent years, the authors have been particularly successful in developing models that are based on Bethe's theory of energy loss by fast charged particles. The theory requires evaluation of coefficients in Bethe's asymptotic expansion of the first born approximation to the inelastic scattering cross section of high velocity ions. These coefficients can be calculated from quantum mechanics; however this approach is laborious and of questionable accuracy for molecular targets. Recognizing that the desired coefficients are independent of projectile properties, they developed a semiempirical method to evaluate them that is based on measured optical oscillator strengths and proton impact ionization data at a single ion energy. They can then use the coefficients to predict the energy spectrum of secondary electrons ejected by any bare ion at any energy that is sufficiently large to make the Bethe theory valid.

17316 (PNL—5500-Pt.4, pp 18) **Structured ion impact: double differential cross sections.** DuBois, R.D. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

For structured ion impact, the projectile arrives at the collision region with its own electron(s). Hence the electrons observed emanating from the collision region can arise from 1) target ionization or 2) projectile ionization. Since the electrons arising from projectile ionization predominantly have very low energies in the projectile frame, they are strongly peaked in angle and energy in the laboratory frame. Hence, in some cases, it is possible to graphically separate them from the smooth underlying continuum of electrons due to target ionization. To provide some information in this subject, the authors have initiated a new series of experiments in which the emitted electrons are observed in coincidence with another collision product. Using He^+ - Ar collisions as an initial test, they measured coincidences between emitted electrons and the direct beam (e^-, He^+) as well as between electrons and the stripped beam (e^-, He^{++}). These should correspond to target ionization and projectile ionization, respectively.

17317 (PNL—5500-Pt.4, pp 18-19) **Theoretical cross sections for ionization structured ions.** Miller, J.H.; Toburen, L.H.; Manson, S.T. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Most of the energy deposited in tissue by ionizing radiation is delivered by structureless, charged particles (bare ions). At low velocity, positive ions may capture electrons from medium to form structured ions. The cross sections for ionization by structured ions are usually derived from bare ion data through the use of an effective charge. This approximation cannot explain the difference between the energy spectra of secondary electrons ejected by bare ions and that of structured ions. The Born approximation provides a conceptual framework for understanding the features of differential cross sections for ionization by structured ion, but ab initio calculations are only practical. The authors have discovered that the characteristics of Bethe's theory for bare ions that make it amenable to semiempirical calculations can be carried over to structured ions. By including the form-factor of the orbital electron on the projectile in the integration over momentum transfer, the single differential cross section for target ionization can be expressed.

17318 (PNL—5500-Pt.4, pp 19-20) **Total ion and electron yields.** DuBois, R.D.; Rudd, M.E. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

In 1981, in collaboration with Prof. M.E. Rudd (University of Nebraska), the authors began an experimental investigation of total ion and electron production cross sections. The study emphasized absolute cross sections over a broad energy range for many atomic and molecular targets. Such cross sections are essential in evaluating their existing double differential cross sections and provide accurate normalizations for track structure calculations. Initially the work concentrated on proton impact ionization. Cross sections from 5-4000 keV were measured and fitted to empirical equations. This greatly facilitates their incorporation into track structure computer codes. These data for ten atomic and molecular targets were published in Physical Review A in January 1984. The H_2O data were missing from this initial study. These data have since been evaluated in the same manner. In addition, this year they have turned their attention to He^+ impact.

17319 (PNL—5500-Pt.4, pp 20-21) **Multiple target ionization by proton impact.** DuBois, R.D.; Toburen, L.H.; Manson, S.T. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The experimental total and double differential cross section measurements provide no information about the final target ion charge state. It is generally assumed that single ionization dominates and that any multiple ionization occurs via the Auger channel. However, in measurements of multiple ionization due to proton impact, the authors found that approximately 60% of the electron production for high energy H^+ - Kr collisions was the result of multiple ionization. Thus it is essential to incorporate multiple ionization into the theoretical picture of the collision; but to do so, one must determine what multiple ionization mechanisms are important. Hence, last year the authors determined cross sections for all relevant channels leading to double ionization of Ne by high energy proton impact.

17320 (PNL—5500-Pt.4, pp 23-25) **Measurement of energy deposition near heavy ion tracks.** Metting, N.F.; Brady, L.A.; Rossi, H.H.; Kliauga, P.J.; Howard, J.; Wong, M.; Schimmerling, W.; Rapkin, M. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

In November of 1982 work was begun in collaboration with Columbia University and Lawrence Berkeley Laboratory to use microdosimetric methods to measure energy deposition of heavy ions produced at LBL's Bevalac Biomedical Facility. Last year the authors reported preliminary results indicating that secondary

charged particle equilibrium was probably obtained using this experimental setup, but that there seemed to be poor spatial resolution in the solid state position-sensitive detector. Further analysis of the measurements taken in August 1983 shows that because of this electronic noise in the position-sensitive detector, only the ^{56}Fe data yielded useful microdosimetric spectra.

17321 (PNL—5500-Pt.4, pp 25-26) **Effects of phase on differential ionization cross sections.** Miller, J.H.; Wilson, W.E.; Brenner, D.J. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The data base for understanding interactions of radiation with matter is obtained primarily from experiments in the gas phase; however, in radiological physics the authors are mostly concerned with energy deposition in a condensed medium. Hence, it is important to understand how intermolecular forces in condensed matter effect energy transfer and degradation. Phase effects can be divided into two categories. 1) effects of phase on the transfer of energy from radiation to matter and 2) the phase dependence of energy degradation and formation of chemical species. The former, which is much better understood at present, is discussed in this section.

17322 (PNL—5500-Pt.4, pp 26-27) **Ion yields in liquid water.** Miller, J.H.; Brenner, D.J.; Ritchie, R.H. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

Progress in modeling the phase dependence of differential ionization cross sections has provided some of the basic information needed to calculate ion yields in liquid water. However, since little is known about the physical mechanisms that determine the yield of chemical species in condensed matter, many assumptions must be made before one can connect the basic cross section data with picosecond yield measurements. This paper summarizes their current model. Most ions are formed in glancing collisions with small momentum and energy transfer to the medium. In liquid water the final state of such collisions is expected to be a low energy, quasi-free electron and a residual ion with a vacancy in one of the valence orbitals. Multiple ionization is neglected in the current model.

17323 (PNL—5500-Pt.4, pp 29-30) **Application of microdosimetry techniques in health physics.** Braby, L.A.; Metting, N.F. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

In recent years tissue equivalent proportional counters (TEPC) an microdosimetric concepts have provided valuable insights into the nature of the interaction of various radiations with biological material. It is now becoming evident that these same techniques can be extended to improve measurements of mixed radiation fields for the purpose of radiation protection. A prototype instrument that the authors developed for NASA under a related services agreement has shown that it is possible to automate all of the necessary functions and to provide the required sensitivity in a compact portable instrument. Subsequent analysis of data collected with this instrument has shown that it produces dose equivalent and mean quality factor values in good agreement with calculated values for monoenergetic neutrons.

17324 (PNL—5500-Pt.4, pp 53-54) **Monte Carlo calculation of energy deposition and ionization yield for high energy protons.** Wilson, W.E.; McDonald, J.C.; Coyne, J.J.; Paretzke, H.G. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

The stochastic distributions of ionization and energy deposition in small volumes (volumes less than a few tenths of a micron in diameter) by charged particles are of importance to the dosimetry of internal alpha emitters. The calculation of these distributions and parameterization of their systematics is a major activity since the results will be useful in other dosimetry areas as well. One such application is introducing straggling into event-size spectra for neutrons. Recent calculations of event-size spectra for neutrons use of continuous slowing down approximation model for the energy losses experienced by secondary charged particles (protons and alphas) and thus do not allow for any straggling effects. Discrepancies between the calculations and experimental measurements are thought to be, in part, due to the neglect of straggling. A tractable method for including stochastics in the radiation transport calculations is the Monte Carlo method; a number of efforts toward simulating positive ion track structure have been initiated. Major emphasis has been on calculating energy deposition and ionization yield spectra for recoil proton crossers since they are the most prevalent event type at high energies for small volumes. Neutron event-size spectra can then be obtained from them by numerical summing folding techniques.

17325 (SLAC-PUB—4203) **Properties of the EM cascade: A tutorial utilizing high resolution 3D color graphics.** Nelson, W.R. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Feb 1987. 22p. (CONF-870219—8). NTIS, PC A02. File Number DE87005596.

From Midyear topical symposium of the Health Physics Society: health physics of radiation-producing machines; Reno, NV, USA (8 Feb 1987).

The fundamental interactions of electrons and photons are reviewed that are important to shower physics. The shower is then described, including a simple model, an advanced analytic model, and Monte Carlo approaches. Examples of real, as well as simulated, EM showers are discussed, and some "rules of thumb" are provided. (LEW)

17326 (UCRL—95946) **Modeling the behavior of optical elements in radiation environments.** Barlow, T.A.; Rhoades, C.E. Jr.; Merker, M.; Triplett, J.R. (Lawrence Livermore National Lab., CA (USA); S-Cubed, La Jolla, CA (USA)). 3 Nov 1986. Contract W-7405-ENG-48. 9p. (CONF-8611116—3). NTIS, PC A02. File Number DE87005053.

From Nuclear explosives code developers conference; Albuquerque, NM, USA (16 Nov 1986).

Calculation of heating caused by the deposition of x-rays in thin film optical elements is complicated because the mean free path of photo and autoionization electrons is comparable to the thin film thickness and thus the electron deposition cannot be considered local. This paper describes the modeling in a 1-D code of: (a) x-ray deposition and transport; (b) electron production, deposition and transport; and (c) thermal conduction and transport. X-ray transport is handled by multigroup discrete ordinates, electron transport is done by the method of characteristics, applied to the two term spherical harmonics expansion approximation (P1) to the Spencer-Lewis transport equation, and thermal transport is computed by a simple Richardson extrapolation of a backward Euler solution to the heat conduction equations. Results of a few test cases are presented. 8 refs., 26 figs., 2 tabs.

17327 **Evaluation and testing of double differential Fe(n,n') cross sections.** Fu, C.Y.; Hetrick, D.M. (Oak Ridge National Lab., TN). *Transactions of the American Nuclear Society;* 53: 409-410(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

Analyses of integral experiments that include thick (>15-cm) iron regions have shown a consistent underprediction of neutron transmission. One explanation that has been offered is that the angular distributions of the inelastically scattered neutrons in the continuum in the current ENDF/B-V iron evaluation were assumed to be isotropic. In reality, these distributions are forward peaked, especially if the incident neutron energies (E/sub n/) are a few MeV greater than the continuum Q-value. The forward peaking also increases with increasing outgoing neutron energies (E/sub n'), giving rise to correlated energy-angle distributions. To understand their effects on neutron penetration through iron, the authors generated such correlated distributions in a special update of the ENDF/B-V Mod-3 iron evaluation and reanalyzed an iron sphere problem. Results are presented.

17328 **Conversion of radionuclide transport codes to IBM-compatible microcomputers.** Pon, W.D.; Marschke, S.F. (Envirosphere Co.). *Transactions of the American Nuclear Society;* 53: 416-419(1986). (CONF-861102—).

From American Nuclear Society and Atomic Industrial Forum joint meeting; Washington, DC, USA (16 Nov 1986).

This paper presents an approach for modifying select US Nuclear Regulatory Commission (NRC) computer codes for use on an IBM microcomputer and/or compatibles. The three codes selected are GALE, GASPAR, and LADTAP. These codes are used by utilities, architect/engineering firms, and various governing bodies for estimating normal operational radiological releases and impacts. Originally written for large mainframe computers, they have been transferred to smaller minicomputer systems without any real conversion of the structure of the codes.

17329 **(BARC—1303) Calibration of high-dose radiation facilities (Handbook).** (Bhabha Atomic Research Centre, Bombay (India)). 1986. 107p. NTIS (US Sales Only), PC A06/MF A01. File Number DE87701266.

In India at present several high intensity radiation sources are used. There are 135 teletheraphy machines and 65 high intensity cobalt-60 sources in the form of gamma chambers (2.5 Ci) and PANBIT (50 Ci). Several food irradiation facilities and a medical sterilization plant ISOMED are also in operation. The application of these high intensity sources involve a wide variation of dose from 10 Gy to 100 kGy. Accurate and reproducible radiation dosimetry is essential in the use of these sources. This handbook is especially compiled for calibration of high-dose radiation facilities. The first few chapters discuss such topics as interaction of radiation with matter, radiation chemistry, radiation processing, commonly used high intensity radiation sources and their special features, radiation units and dosimetry principles. In the chapters which follow, chemical dosimeters are discussed in detail. This discussion covers Fricke dosimeter, FBX dosimeter, ceric sulphate dosimeter, free radical dosimetry, coloured indicators for irrdiation verification. A final chapter is devoted to practical hints to be followed in calibration work.

17330 **(EGG-M—19086) SKYSHIN: A computer code for calculating radiation dose over a barrier.** Atwood, C.L.; Boland, J.R.; Dickman, P.T. (EG and G Idaho, Inc., Idaho Falls (USA); USDOE Nevada Operations Office, Las Vegas; REECo, Las Vegas, NV (USA)). Nov 1986. Contract AC07-76ID01570. 9p. (CONF-870219—3). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87002100.

From Midyear topical symposium of the Health Physics Society: health physics of radiation-producing machines; Reno, NV, USA (8 Feb 1987).

SKYSHIN is a computer code for calculating the radioactive dose (mrem), when there is a barrier between the point source and the receptor. The two geometrical configurations considered are: the source and receptor separated by a rectangular wall, and the source at the bottom of a cylindrical hole in the ground. Each gamma ray traveling over the barrier is assumed to be scattered at a single point. The dose to a receptor from such paths is numerically integrated for the total dose, with symmetry used to reduce the triple integral to a double integral. The buildup factor used along a straight line through air is based on published data, and extrapolated in a stable way to low energy levels. This buildup factor was validated by comparing calculated and experimental line-of-sight doses. The entire code shows good agreement to limited field data. The code runs on a CDC or on a Vax computer, and could be modified easily for others.

17331 **(PB—87-109872/XAB) Calibration of beta-particle ophthalmic applicators at the National Bureau of Standards.** Pruitt, J.S. (National Bureau of Standards, Washington, DC (USA)). 27 Aug 1986. 6p. NTIS, PC A05/MF A01).

The method used at the National Bureau of Standards for the calibration of strontium-90 + yttrium-90 beta-particle ophthalmic applicators in terms of absorbed dose to water, is described. The method involves measurement of ionization density at the applicator surface with an extrapolation chamber, correction for the difference in backscatter between the collection electrode and water, and application of the Bragg-Gray equation. The calibration obtained is an average over the active surface of the applicator. The overall uncertainty of the surface calibration is about + or - 15 percent.

17332 **(PNL—5500-Pt.4, pp 52-53) Averaging dose in inhomogeneously irradiated tissue.** Roesch, W.C. Feb 1985. NTIS, PC A05/MF A01. File Number DE85009285.

In Pacific Northwest Laboratory annual report for 1984 to the DOE Office of Energy Research. Part 4. Physical sciences.

In doing dosimetry for radiation protection, time and cost usually lead the authors to settle for just one, or a few measurements of the dose a person might receive. These single doses sometimes have to represent situations in which the dose throughout an individual or an individual organ may be quite inhomogeneous, i.e., the dose may have a wide range of values. In many cell-culture experiments, if the dose is not too high, the effect is found to be a linear-quadratic function of the dose. In these experiments, the dose is uniform throughout the culture. If similar expressions are assumed to hold for cells receiving the same dose in vivo, then the average effect in a tissue where the dose is inhomogeneous can be found only when the corresponding averaged for both the dose and the square of the dose are known. Then the observed effects can be related to that found in vitro or to compare effects in different tissues.

17333 **Two example applications of optimization techniques to radiation protection programmes of United States Department of Energy Contractors.** Merwin, S.E.; Martin, J.B.; Selby, J.M.; Vallario, E.J. (Battelle Pacific Northwest Labs., Richland, WA, USA; Department of Energy, Washington, DC, USA. Office of Nuclear Safety). pp 193-203 of Optimization of radiation protection. Proceedings of an international symposium held in Vienna, 10-14 March 1986. Vienna, Austria; IAEA (1986). (CONF-860315—).

From International symposium on the optimization of radiation protection; Vienna, Austria (10 Mar 1986).

Six numerical examples of optimization of radiation protection are provided in the appendices of International Commission on Radiological Protection (ICRP) Publication 37. In each case, the calculations are based on fairly well defined parameters and assumptions that were well understood. In the paper, the authors examine two numerical examples that are based on empirical data and less certain assumptions. These examples may represent typical applications of optimization principles to the evaluation of specific elements of a radiation protection programme. In the first example, the optimum bioassay frequency for tritium workers was found to be once every 95 days, which compared well with the recommendations of ICRP Publication 10. However, this result depended heavily on the assumption that the value of a potential undetected rem was US$1000. The second example showed that the optimum frequency for recalibrating Cutie-Pie-type (CP) ionization chamber survey instruments was once every 102 days, which compared well with the Hanford standard frequency of once every 90 days. This result depended largely on the assumption that an improperly operating CP instrument could lead to a serious overexposure. These examples have led us to conclude that optimization of radiation protection programmes must be a very dynamic process. Examples must be recalculated as empirical data grow and improve and as the uncertainties surrounding assumptions are reduced. 5 refs, 3 figs.

17334 **Task group on Reference Man to revise ICRP Publication 23.** Richmond, C.R. (Oak Ridge National Lab., TN). *Health Physics;* 49: No. 5, 1015(Nov 1985).

In 1975 the International Commission on Radiological Protection (ICRP) published ICRP Publication 23, the Report of the Task Group on Reference Man. ICRP Publication 23 is about 15 y out of date, because the references cited end around 1970. At its 1984 meeting, the ICRP approved the formation of a new task group to revise and update this publication, with completion expected in about 3 y. The revision will include more emphasis on variations due to age, sex, and other individual differences in anatomical and physiological data and in the gross and elemental composition of tissues. The emphasis in Publication 23 is on data for

radiation workers, and the new emphasis reflects that radiation doses to the whole population are of increasing interest to the ICRP and national bodies interested in radiation protection.

17335 **Dose rate conversion factors.** Beck, H.L.; de Planque, G. (Dept. of Energy, New York, NY). *Health Physics;* 49: No. 5, 1015-1016(1985).

A letter to the editor comments on a recent Health Physics article in which dose-rate conversion factors were presented for external exposure to monoenergetic photon emitters in soil for various source depth distributions. The buildup factors are discussed.

17336 **(BARC—1294) Radiation enhanced self diffusion in silver.** (Bhabha Atomic Research Centre, Bombay (India)). 1985. 9p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701259.

Radiation enhanced self diffusion in silver has been studied at room temperature as a function of defect production rate J(J varies between 0.90 dpa s/sup -1/ to 2.25 dpa s/sup -1/). The results show that the main mechanism of annihilation of point defects is by mutual recombination rather than migration to fixed sinks. 5 refs., 6 figures.

17337 **(BNL—39054) Spin-waves in the uniaxial spin-glass system Fe/sub 1-x/Mg/sub x/Cl$_2$.** Wong, P.Z.; Yoshizawa, H.; Shapiro, S.M. (Schlumberger-Doll Research Center, Ridgefield, CT (USA); Tokyo Univ. (Japan). Inst. for Solid State Physics; Brookhaven National Lab., Upton, NY (USA)). 12 Nov 1986. Contract AC02-76CH00016. 13p. (CONF-861111—20). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004246.

From Conference on magnetism and magnetic materials; Baltimore, MD, USA (17 Nov 1986).

We report as inelastic neutron scattering study of the uniaxial dilute antiferromagnets Fe/sub 1-x/Mg/sub x/Cl$_2$, for $x = 0.3$, 0.45 and 0.6. The first two samples have long-range AF order. Their spin-wave peaks are broadened by the exchange fluctuations. The $x = 0.6$ sample oders like an Ising spin-glass with a very short AF correlation length ($\xi \approx 10$ A). For wavelength $\lambda \leq \xi$, the spin-wave peaks are similar to the dilute antiferromagnets, but for $\lambda \leq 2\xi$, the peak shapens up and becomes resolution limited at the zone center. We give a simple explanation of this behavior. 13 refs., 1 fig.

17338 **(CONF-850484—) Photon emission from irradiated solids: Proceedings of the Werner Brandt workshop on penetration phenomena.** (Oak Ridge National Lab., TN (USA)). Nov 1986. Contract AC05-84OR21400. 181p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE87002878.

From Penetration phenomena workshop; Oak Ridge, TN, USA (14 Apr 1985).

The workshop was concerned with photon emission from irradiated solids and the present record of the proceedings consists of material solicited from each participant. The results range from detailed and complete manuscripts to skeletal remnants of Vugraph transparencies. Individual papers have been cataloged separately.

17339 **(CONF-861111—21) Induced magnetic form factor of CeCu$_6$.** Vrtis, M.L.; Loong, C.K.; Hinks, D.G.; Stassis, C.; Arthur, J.R. (Argonne National Lab., IL (USA); Ames Lab., IA (USA); Oak Ridge National Lab., TN (USA)). 1986. Contract W-31109-ENG-38. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004698.

From Conference on magnetism and magnetic materials; Baltimore, MD, USA (17 Nov 1986).

Polarized neutron scattering techniques have been used to study the spatial distribution and temperature dependence of the magnetization induced by an externally applied magnetic field in a single crystal of CeCu$_6$, a heavy-fermion compound that remains paramagnetic and non-superconducting down to ~10 mK. The measurements were performed at 4.2 K and 92 mK in an applied magnetic field of 50 kOe. We find that the induced magnetization is predominately of 4f electronic character and exhibits Pauli-like behavior in the 4.2 K to 92 mK temperature region. 17 refs., 2 figs.

17340 **(CONF-870144—1) The effects of heavy doping on the electronic states in semiconductors.** Sernelius, B.E. (Oak Ridge National Lab., TN (USA); Tennessee Univ., Knoxville (USA). Dept. of Physics). Jan 1987. Contract AC05-84OR21400. 90p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87004421.

From International solid state physics workshop; Santiago, Chile (1 Jan 1987).

The physics of semiconductors is reviewed. Topics included in the discussion are energy of the dopant system (kinetic energy in a many-valley semiconductor, exchange energy in an ellipsoidal Fermi volume, energy in a polar semiconductor), self energy shifts, band-gap narrowing, and piezo experiments. 31 refs., 27 figs.

17341 **(CONF-8508107—3) Chemical potential in a stressed solid.** Li, J.C.M. (Rochester Univ., NY (USA). Dept. of Mechanical Engineering). 1985. Contract FG02-85ER45201. 7p. NTIS, PC A02/MF A01. File Number DE87003666.

From International seminar on solute defect interaction: theory and experiment; Kingston, Ontario, Canada (5 Aug 1985).

The chemical potential in a stressed solid is discussed in general. A chemical potential is defined whose gradient can be used as the driving force for diffusion. This potential is the same as that defined by Gibbs for fluids or solids under hydrostatic pressure and for his "fluid" or mobile components in a generally stressed solid. For crystalline solids, the chemical potential is the same as that of the interstitialcy. However, the definition avoids the need for atomistic details of the diffusion mechanism as long as the external work is well defined upon the addition or removal of the atom by the diffusion process. Hence it is applicable to diffusion along coherent or incoherent interfaces including grain boundaries, in an amorphous soild or in crystalline solids such as Si in which the diffusion mechanism is uncertain.

17342 **(DOE/ER/13007—1) Thin-film chemical sensors based on electron tunneling: Final report.** Khanna, S.K.; Lambe, J.; LeDuc, H.G.; Thakoor, A.P. (Jet Propulsion Lab., Pasadena, CA (USA)). 15 Nov 1985. Contract AI01-82ER13007. 37p. (JPL-PUB—85-85). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87004646.

The physical mechanisms underlying a novel chemical sensor based on electron tunneling in metal-insulator-metal (MIM) tunnel junctions were studied. Chemical sensors based on electron tunneling were shown to be sensitive to a variety of substances that include iodine, mercury, bismuth, ethylenedibromide, and ethylenedichloride. A sensitivity of 13 parts per billion of iodine dissolved in hexane was demonstrated. The physical mechanisms involved in the chemical sensitivity of these devices were determined to be the chemical alteration of the surface electronic structure of the top metal electrode in the MIM structure. In addition, electroreflectance spectroscopy (ERS) was studied as a complementary surface-sensitive technique. ERS was shown to be sensitive to both iodine and mercury. Electrolyte electroreflectance and solid-state MIM electroreflectance revealed qualitatively the same chemical response. A modified thin-film structure was also studied in which a chemically active layer was introduced at the top Metal-Insulator interface of the MIM devices. Cobalt phthalocyanine was used for the chemically active layer in this study. Devices modified in this way were shown to be sensitive to iodine and nitrogen dioxide. The chemical sensitivity of the modified structure was due to conductance changes in the active layer. 32 refs., 24 figs.

17343 **(DOE/ER/25009—371) Optimization by a computational neural net.** Williams, R.D. (California Inst. of Tech., Pasadena (USA)). 20 Nov 1986. Contract FG03-85ER25009;AC03-81ER40050. 21p. (CALT—68-1409). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005033.

A computational neural net is a fast analogue device that solves the mean-field equations for a spin glass, and can thus find a

local minimum of the spin-glass Hamiltonian. Many difficult combinatorial optimization problems can be cast in the form of spin glass minimization, and in this paper we contrast the quality of the minima achieved by a neutral net with those from simulated annealing. 12 refs., 3 figs.

17344 **(EFI—774(1)-85) Defects and color centers induced in corundum and ruby by high energy electrons. 3. Optical properties of corundum irradiated by high energy electrons.** Atabekyan, R.R.; Gevorkyan, V.A.; Ezoyan, R.K.; Eritsyan, G.N.; Sarkisov, V.Kh. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700670.

Experimental results of the investigation of the kinemacs of storage, isochronous and isothermic annealing of coloraters induced in corundum by 50 MeV electrons are presented. The order of the reaction $\gamma=3$ and activation enegy epsilon = 1.1 eV are calculated basing on the data obtained. 13 refs.; 4 figs.

17345 (INIS-mf—10556-Vol.1, pp 90-100) **Electron and ion beams in surface investigation of solids.** Delong, A. (Ceskoslovenska Akademie Ved, Brno. Ustav Pristrovoje Techniky). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Attention is devoted to methods of the study of solid surfaces, especially to those which allow to image the studied surface by electron and ion microscopy. Experimental possibilities are summed up and indicated of the different methods. The paper deals with the configuration of electron and ion optical systems for surface studies; with imaging and analysis of surfaces using transmission electron microscopy and scanning transmission electron microscopy; with reflection and diffraction electron microscopy; with scanning electron microscopy; with emission electron microscopy; and with the use of ions for studies of solid surfaces. (S.P.).

17346 (INIS-mf—10556-Vol.2, pp 459-464) **Surface studies by sputtering.** Sigmund, P. (Odense Univ., Denmark). 1984. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700738. (CONF-8408138—Vol.2).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

The article presents an overview of the study of materials surfaces by sputtering, i.e., using the method of materials erosion under particle bombardment. The phenomenon is described in general terms, of sputtering by ion beams and possible practical applications are indicated. The techniques used in experimental investigations of the sputtering effect are dealt with and the mechanism of processes contributing to the effect is described. The emission of molecules and clusters in particle bombardment of surfaces is also discussed. Attention is then devoted to sputtering processes in multicomponent materials under the impact of ion bombardment of surfaces. (S.P.).

17347 **(INS—543) Monte Carlo study of anisotropic Heisenberg chain with spin 1.** (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study). Jun 1985. 22p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701313.

A Monte Carlo method of quantum spin 1 systems is presented. The internal energy and longitudinal correlation functions are computed in the antiferromagnetic region. Some exponents and phase diagram are derived in good accuracy.

17348 **(ITEF—81(1985)) Dynamic processes when irradiating of solids.** (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 51p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87701318.

General results of scientific-technical colaboration of the Institute of Theoretical and Experimental Physics and A.A. Baykov Metallurgy Institute of AS of USSR are given. The purpose of combined investigations is to develop ideas about dynamic processes when irradiating of solids, from a position of search of ways for the solution of applied problems of radiation material-science and radiation technology. The research program is given; the means of its security are enumerated; the most important information on dynamic processes, obtained by means of different experimental methods, is given too. The possible fields of practical using of this work results are shown; the prospects of subsequent investigations and the role of field ion microscopic analysis of defect structural of irradiated metallic specimens in these investigations are outlined. 58 refs.; 5 figs.; 3 tabs.

17349 **(ITEF—186(1984)) Symmetrized coordinate method in profile analysis for commensurable structure phase transformations.** Sikora, V.; Smirnov, P.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1984. 28p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700749.

Models of possible crystal structures of low-symmetric phase in cerium and lanthanum trihydrides are plotted. Topological peculiarity of fermi-surface of highly symmetric phase is used for determination of wave vector stars over which phse transition proceeds and possible crystal lattices of the low-symmetric phase. The theoretical-group analysis was used to identify hydrogen deuterium atom positions in new Brave HC-cells as shifts of BC-phase. The observed additional reflections on neutron powdergrams are shown to be conditioned by these shifts. 10 refs.; 3 tabs.

17350 **(LA-UR—86-3745) The spatial dependence of spin and charge correlations in a one-dimensional, single impurity, Anderson model.** Gubernatis, J.E. (Los Alamos National Lab., NM (USA)). 1986. Contract W-7405-ENG-36. 11p. (CONF-8611111—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87002927.

From Taniguchi symposium on Quantum Monte Carlo; Shizuoka, Japan (13 Nov 1986).

Summarized are the results of a series of quantum Monte Carlo calculations of the spatial dependence of spin and charge correlations in a one-dimensional, single impurity, symmetric Anderson model. We corroborated several features of the model of Gubernatis, Hirsch, and Scalapino, and because we achieved lower temperatures, we were able to identify several additional unusual features in the behavior of the correlations as functions of U and β. We also showed the existence of a charge compensation sum role and found a power law decay of the correlations at low temperatures.

17351 **(LA-UR—86-4187) Nuclear interlevel transfer driven by collective outer shell electron oscillations.** Rinker, G.A.; Solem, J.G.; Biedenharn, L.C. (Los Alamos National Lab., NM (USA); Duke Univ., Durham, NC (USA)). 20 Oct 1986. Contract W-7405-ENG-36. 13p. (CONF-861038—6). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003734.

From OSA/APS international laser science conference ↑; 0.

The general problem of dynamic electron-nucleus coupling is discussed, and the possibility of using this mechanism to initiate gamma-ray lasing. Single-particle and collective mechanisms are considered. The problems associated with accurate calculation of these processes are discussed, and some numerical results are given. Work in process in described. 10 refs., 7 figs.

17352 **(LA-UR—86-4339) Analysis of picosecond pulsed laser melted graphite.** Steinbeck, J.; Braunstein, G.; Speck, J.; Dresselhaus, M.S.; Huang, C.Y.; Malvezzi, A.M.; Bloembergen, N. (Los Alamos National Lab., NM (USA); Massachusetts Inst. of Tech., Cambridge (USA); Harvard Univ., Cambridge, MA (USA)). 1986. Contract W-7405-ENG-36. 10p. (CONF-861207—45). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003755.

From Materials Research Society fall meeting; Boston, MA, USA (1 Dec 1986).

A Raman microprobe and high resolution TEM have been used to analyze the resolidified region of liquid carbon generated by picosecond pulse laser radiation. From the relative intensities of the zone center Raman-allowed mode for graphite at 1582 cm^{-1}

and the disorder-induced mode at 1360 cm^{-1}, the average graphite crystallite size in the resolidified region is determined as a function of position. By comparison with Rutherford backscattering spectra and Raman spectra from nonosecond pulsed laser melting experiments, the disorder depth for picosecond pulsed laser melted graphite is determined as a function of irradiating energy density. Comparisons of TEM micrographs for nanosecond and picosecond pulsed laser melting experiments show that the structure of the laser disordered regions in graphite are similar and exhibit similar behavior with increasing laser pulse fluence.

17353 **(ORNL/M—295) Soft x-ray emission spectra of lithium fluoride excited by synchrotron radiation.** Tsang, K.L.; Zhang, C.H.; Callcott, T.A.; Arakawa, E.T.; Ederer, D.L. (Tennessee Univ., Knoxville (USA). Dept. of Physics; Oak Ridge National Lab., TN (USA); National Bureau of Standards, Washington, DC (USA). Synchrotron Ultraviolet Radiation Facility). [1986]. Contract AC05-84OR21400. 2p. NTIS, PC A02. File Number DE87005231.

A core excited Li atom is perhaps the simplest cation defect that can be introduced into LiF. It frequently binds an electron in an electronic state, whose properties dominate both the soft x-ray absorption and soft x-ray emission properties of LiF. This phenomena was examined using a new, very high efficiency, emission spectrometer. Exciton and valence band peaks were observed which decay with time and are replaced by a metallic Li peak at 54 eV.

6561 Superconductivity

17354 **(CONF-860914—31) Nature of coupling and dimensional crossover in superconducting multilayers.** Locquet, J.P.; Sevenhans, W.; Bruynseraede, Y.; Homma, H.; Schuller, I.K. (Argonne National Lab., IL (USA); Louvain Univ. (Belgium). Lab. voor Vaste Stof-Fysika en Magnetisme). Sep 1986. Contract W-31109-ENG-38. 5p. NTIS, PC A02. File Number DE87004676.

From Applied superconductivity conference (ASC '86); Baltimore, MD, USA (28 Sep 1986).

A comparison of the temperature dependent upper critical fields in Josephson and proximity coupled multilayers is presented. The results are in good agreement with theoretical expectations which predict that the main determining factor is the spatial variation of the electronic density of states.

17355 **(IAE—4027/10) On the stability of superconducting systems under slightly chance thermal perturbations.** Levchenko, E.B.; Chechetkin, V.R. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1984. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700701.

Mean time of transient to the normal state is calculated for a superconductor with transport current and forced cooling under the action of weak random heat release. Perturbations are considered in the form of given external noise source and are simulated by the Gaussian white noise and shot white noise. In the limits of "dense" noise mean time of transient may be found from the solution of the functional Fokker-Plank equation (the Gaussian noise) or from the solution of the functional Kholmogorov-Feller equation (shot noise). Two limiting cases of spatialy homogeneous and spatially localized heat perturbations are under study. In the latter case a transient to the normal state is accomplished by means of fluctuation formation and the following propagation of the minimum propagating zone. 27 refs.; 2 figs.

17356 **(CEA-CONF—8514) Numerical solution of transport equations with particle correction.** Sentis, R. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). May 1986. 4p. (In French). (CONF-8605206—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750564.

From National congress on numerical analysis; Port Barcares, France (26 May 1986).

In particle transport phenomena, particle density verifies an equation basis of a whole series of physics modelling and which is used in numerous applications such as neutronics, astrophysics, lasers, plasmas, electron beams, etc. A resolution method of such equations is proposed here, based on moments method in which the flux is calculated thanks to an estimation made with a particle method.

17357 **(CONF-860789—3) What underlies the Anderson Hamiltonian.** Koelling, D.D. (Argonne National Lab., IL (USA)). Oct 1986. Contract W-31109-ENG-38. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004991.

From International workshop on condensed matter theories; Argonne, IL, USA (21 Jul 1986).

The Anderson Hamiltonian characterizes a model in which local orbitals interact with each other through Coulomb interactions and with a bath of itinerant states through hybridization. In trying to find a prescription for the parameters of the model, one simultaneously develops some understanding of the states involved and studies whether the model incorporates enough of the essential physics. One useful tactic is to compare this model with other models and ask how different effects are accommodated. This paper compares results from the model with atomic, band, and modified band calculations for f-electron materials. It did not appear to incorporate effects that seemed to be significant. Specifically, it is difficult to see the relation of this model to the multiple-screening-mode model which is a natural interpretation of our band calculations. The computations are represented as a surrogate for the experiment.

17358 **(CONF-861247—1) Excitations in small spherical particles.** Rojas, R.; Claro, F. (Oak Ridge National Lab., TN (USA); Universidad Tecnica Federico Santa Maria, Valparaiso (Chile); Universidad Catolica de Chile, Santiago). Oct 1986. Contract AC05-84OR21400. 9p. (In Spanish). NTIS, PC A02/MF A01; GPO Dep. File Number DE87001941.

From 5. simposio Chiceno de Fisica; Santiago, Chile (18 Dec 1986).

The multipolar polarizability of a small metallic sphere with an oxide coating is obtained within the semiclassical infinite barrier method. The optical absorption and the energy loss spectrum are calculated for Al/Al_2O_3 spheres. A Lindhard-Mermin dielectric function is assumed for the response of the metal. 14 refs., 2 figs.

17359 **(EFI—775(2)-85) Gravitation and vacuum field.** Tevikyan, R.V. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 16p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700671.

Equations are proposed that describe particles with the spins s=0, 0.5, 1 completely, i.e. 2s+2 limiting fields at E -> infinity too. It is proved that the ordinary Gilbert-Einstein action for the gravitation field should be complemented by an action for the Bose-vacuum field. This implies that a cosmological term proportional to the square strength of the bose-vacuum field shoul be introduced in gravitation equations. A table of possible interactions of elementary particles is proposed on the basis of Poincare groups. A third form of matter, the vacuum field, is introduced in the field theory. 14 refs.; 1 fig.

17360 **(IFVE-OTF—85-56) Scalar multiplets in N=2 supergravity.** Zinov'ev, Yu.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700725.

Submitted to the journal Phys. Lett. .

A simple explicit construction of three types of models for scalar multiplets interaction with N=2 supergravity is proposed. Their scalar sectors correspond to the non-linear σ-models Sp(2, 2n)/Sp(2) x Sp(2n) sectors SU(2,n)/SU(2) x SU(n) x U(1) and O(4,n)/O(4) x O(n). 3 refs.

17361 **(IFVE-OTF—85-70) Baryon string model. Part 3. Quantum theory of single-mode configurations of three-string.** Plyushchaj, M.S.; Pron'ko, G.P.; Razumov, A.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700726.

Submitted to the journal Theor. Math. Phys. .

The model, obtained by freezing the infinite number of degrees of freedom of a relativistic three-string is considered. Two possible one-mode configurations of a baryonic string are quantized, and the relativistic invariance of the resulting quantum systems is proved. 12 refs.; 2 figs.

17362 **(IFVE-OTF—85-167) Gravitational collapse in relativistic theory of gravitation.** Vlasov, A.A.; Logunov, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1985. 20p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700730.

Submitted to the journal Theor. Math. Phys. .

It is shown that in the relativistic theory of gravitation, unlike GTR, the process of the massive body compression by gravitational forces has been stopped at the finite density of matter for the final period of the proper time. This phenomenon of gravitational kernel may be understood when analysing the motion of a probe particle in the gravitational field of the sphericlly symmetric body in Minkowski space. 5 refs.; 4 figs.

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

It was in Prague in 1911 and 1912 when Einstein started systematically on the way to the general theory of relativity. His Prague papers on gravitation are analyzed with an emphasis on new ideas and concepts but also on false turns he temporarily took. Einstein learned much about gravitation during this period, in particular in formulating new principles and in understanding the features which relativistic theory of gravitation should possess. In several "intermezzos from the present" some results of present-day physics connected with Einstein's ideas from the time of 1911 and 1912 are noted. The atmosphere of Einstein's days in Prague was briefly described in the booklet "Physics and Prague" published on the occasion of the Sixth General Conference of the European Physical Society by the Union of Czechoslovak Mathematicians and Physicists.

File Number DE87700744.

Kaehler-Einstein invariant metrics on compact homogeneous manifolds are described. An exact Gell-Mann-Low function in considered cases is given by one-loop approximation. 22 refs.

17367 **(ITEF—102(1985)) Kaehler-Einstein invariant metrics on compact homogeneous manifolds.** Alekseevskij, D.V.; Perelomov, A.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 18p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700745.

Kaehler-Einstein invariant metrics on compact homogeneous manifolds are described. An exact Gell-Mann-Low function in considered cases is given by one-loop approximation. 2 refs.

17368 **(ITEF—109(1985)) Radiation gasodynamics equations in the tetrad form for astrophysical applications.** (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 52p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87701319.

The paper deals with the presentation of radiation gasodynamics relativistic equations with account of general relativity theory in the form accepted and widely applied in special relativity theory. With this purpose a strict formal determination of non-inertial accompanying reference system without rotation is given on the base of tetrad formalism using the Fermi-Walker four-momentum transfer rules. In this system derived are equations of physical kinetics relativistic collapse, the Einstein equations, equations of relativistic radiation gasodynamics for perfect and dissipative gases, Taub equation for shock waves with account for radiation and electron-positron pairs. On the base of the use of Lorentz local transformations and Ricci rotation coefficients these equations are recorded in the laboratory reference system to demonstrate the possibility of a relatively simple account of general relativity theory effects in equations having a form accepted in special relativity theory. 49 refs.

17369 **(ITEF—120(1985)) On the particle capture cross section in the Schwarzschild metric.** Zakharov, A.F. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 4p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700746.

An expression for the capture cross section of particle moving with arbitrary velocity at infinity is obtained. Cases of slow and ultrarelativistic motions of particles are considered. A comparison with Mielnik-Plebansky results is carried out. 8 refs.

17370 **(ITF—85-134-R) Reduction of integral equations for four identical particles in the case of finite range forces.** Levashev, V.P.; Navrotskij, M.A. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1985. 43p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700757.

An approach to investigating the four-particle systems is suggested. It is based on integral formulation of the equations of motion in a coordinate representation and uses effectively the short-

range character of nuclear forces. The system of two-dimensional integral equations whose kernels are determined by simpler subsidiary three-dimensional equations is obtained for the four identical spinless particles. 8 refs.; 3 figs.

17371 **(ITP—86-20-E) Study of the P-matrix structure using a potential description of two-particle interaction.** Babenko, V.A.; Petrov, N.M. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1986. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700763.

General relations are obtained for the P-matrix using a potential description. In different approximations for the P-matrix these relations lead to a correct asymptotic behaviour of the scattering phase at high energies. 15 refs.

17372 **(ITP—86-25-E) Generating matrix elements of the Hamiltonian of the algebraic version of resonating group method on intrinsic wave functions with various oscillator lengths.** Badalov, S.A.; Filippov, G.F. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1986. 12p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700764.

The receipts to calculate the generating matrix elements of the algebraic version of resonating group method (RGM) are given for two- and three-cluster nucleon systems, the center of mass motion being separeted exactly. For the Hamiltonian with Gaussian nucleon-nucleon potential dependence the generating matrix elements of the RGM algebraic version can be written down explictly if matrix elements of the corresponding system on wave functions of the Brink cluster model are known. 8 refs.

17373 **(JINR—E-2-85-930) Higher hypercomplex numbers and quantum mechanics.** Polubarinov, I.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 28p. (CONF-8505333—1). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700782.

From 3. seminar group theoretical methods in physics; Jurmala, USSR (22 May 1985).

Algebras of hypercomplex numbers following octonion algebra are considered. These algebras are connected with finite projective geometries. Their main properties are derived from properties of structure constants sub(epsilon)jkl). A derivation of the identity is given that generalizes the law of composition of quadratic forms. Quantum mechanics corresponding to these algebras are formulated, equations of motion are written. Matrix representations are constructed (in the sense of the Dirac representation theory). In these terms the equations of motion take the standard quantum-mechanical Hamiltonian form. Except for the octonian algebra, others are in fact reducible. 56 refs.; 5 figs.; 6 tabs.

17374 **(JINR—E-4-85-527) Kronecker products which decompose into two irreducible representations.** Iosifescu, M.; Scutaru, H. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 9p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700783.

The aim of the work is to determine, for the semisimple Lie algebra of types Bsub(n), Csub(n) and Dsub(n) sets of pairs of irreducible representations having the property that the Kronecker product of the representations of each pair decomposes into a direct sum of two irreducible representations. The proof uses Dynkin theorem and a calculation of dimensionalities. The pairs of representations obtained in this way are ((mΛ/sub 1/), (Asub(n)) for algebras of type Bsub(n), ((Λ/sub 1/), (mAsub(n)) for algebras of type Csub(n), and ((mΛ/sub 1/), (Asub(n-1)), ((mΛ/sub 1/), (Asub(n)), ((Λ/sub 1/), (mAsub(n-1)), ((Λ/sub 1/), (mAsub(n)) for algebras of type Dsub(n)3/where Λ sub(i) denotes the highest weig.ht of the fundamental representation (Asub(i)) and m is an arbitrary positive integer. 9 refs.

17375 **(JINR—E-4-86-40) Approximate two-soliton solution of a generalized Schroedinger equation in nuclear hydrodynamics.** Funke, H. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1986. 6p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700784.

Submitted to the journal Theor. Math. Phys. .

The construction of an approximate two-soliton solution of a nonlinear Schroedinger equation with nonlinearity proportional to αchemical bonduchemical bond/sup 2/u - βchemical bonduchemical bond/sup 4/u via Baecklund transformation known from the cubic Schroedinger equation is proposed. It is shown that this solution has a minimal error and may be used for description of elastic nucleus-nucleus scattering in the hydrodynamic limit. 15 refs.

17376 **(JINR—E-5-85-867) Joint distributions of observables and measures with infinite values.** Dvurecenskij, A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1986. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700785.

Submitted to the Annales d'Institut Henri Poincare Sect. Physique theorique.

In the frame of the quantum logic approach to axiomatization of quantum mechanics the joint distribution of observables in measures attaining infinite values is studied. The necessary and sufficient conditions to existence of the joint distribution are given. The Hilbert space quantum logic model is investigated in more detail. 23 refs.

17377 (JINR—R-2-85-667, pp 130-142) **Gravitational waves with topological charge.** Nikolaenko, V.M. (Gosudarstvennyj Komitet Standartov Soveta Ministrov SSSR, Moscow). 1985. (In Russian). NTIS (US Sales Only), PC A08/MF A01. File Number DE87780075. (CONF-8506332—).

From Conference on the history of particle physics; Dubna, USSR (25 Jun 1985).

A criterion for existence of gravitational radiation bound with the wave equation $\Delta\Omega=0$ is studied. All the solutions of this equation describing plane gravitational waves are classified. It is revealed that plane gravitational waves can be characterized by a gravitational topological charge determining stability of these waves relatively to their continuous deformations. A special case of harmonic plane waves is investigated. The given type of gravitational radiation simulates existence of the pseudoparticle - antiparticle pair. The method of expansion into wave constituents was used to studythe principal possibility of generalization of the basic results obtained for other gravitationalfields.

17378 **(JINR—R-4-85-239) Natural coordinates for the three-body problem in adiabatic approximation.** (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1985. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701335.

Submitted to the journal J. Phys. B (Lett.).

Coordinates are introduced for the system of a, b and c particles with Msub(a), Msub(b) and Msub(c) masses. The coordinates are called natural for they transfer to Jacobi coordinates of these channels in asymptotic regions of configuration space corresponding to channels of (ac)+b, a+(bc) and (ab)+c reactions. Wave functions of adiabatic basis are coordinated with physical boundary conditions in new coordinates. 17 refs.

17379 **(JINR-R—2-85-712) On permissible space anisotropy.** Strel'tsov, V.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1985. 5p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700796.

The concept of distance (coordinate) in the relativity theory is defined on the basis of radar experiment. Here the sum of distances passed by a light signal in forward and back directions is measured directly. Usually these distances are supposed to be equal. By the gauge transformation of space coordinate the permissible space anisotropy is introduced. The generalized Lorentz transformations, expressions for one-way velocities, right and left distances for nonlight signals etc. are considered. 6 refs.

17380 **(JINR-R—11-85-764) Approximate calculation of the conditional Winer integral in quantum mechanics problems. Harmonic oscillator.** Zhidkov, E.P.; Lobanov, Yu.Yu.; Sidorova, O.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1985. 19p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700811.

Application of the functional integration method to obtaining some values of quantum mechanic system in the Euclidean formulation of theory is considered. The conditional Wiener integrals are calculated using our approximate formulas, which are exact for the functional polynomials of certain degree. The use of the method is demonstrated taking the harmonic oscillator as an example. The E/sub 0/, E/sub 1/ energies of the ground and first excited states of this system, propagator G(r)=<0chemical bondx(0)x(r)chemical bond0> and wave function squared of the ground state chemical bondphi/sub 0/(x)chemical bond/sup 2/ are calculated. The results are proved to be in good agreement with the theory. The evaluation of the integrals is performed using the Gauss and Chebyshev quadrature formulas. The comparison of our numerical results with the values obtained by other authors using both Monte Carlo method on the lattice and approximation of the path in the Feynman integral is presented. This comparison shows that our method is more effective. 24 refs.; 3 figs.; 4 tabs.

17381 **(JINR-R—11-85-765) Approximate calculation of the conditional Wiener integral in quantum mechanics problem. Anharmonic oscillator.** Zhidkov, E.P.; Lobanov, Yu.Yu.; Sidorova, O.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1985. 16p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700812.

Application of the functional integration method to obtain some characteristics of quantum mechanics system in the Euclidean formulation of theory is considered. The conditional Wiener integrals are calculated using our approximate formulas, which are exact for the functional polynomials of certain degree. The use of the method is demonstrated taking the anharmonic oscillator with Hsub(g)=1/2(psup(2)+xsup(2))+gxsup(4) and Hsup(f)=1/2(psup(2)+xsup(2))+1/2(xsup(2)-fsup(2))sup(2) as an example. The E/sub 0/, E/sub 1/ energies of the ground and first excited states of this system, propagator G(r)=<0chemical bondx(0)x(r)chemical bond0> and wave function squared of the ground state chemical bondphi/sub 0/(x)chemical bond/sup 2/ are calculated. The evaluation of the integrals is performed using the Gauss and Chebyshev quadrature formulas. The comparison of our numerical results with the values obtained by other authors using both Monte Carlo method on the lattice and approximation of paths in the Feynman integral is presented. This comparison demonstrates a higher efficiency of the method used. 28 refs.; 5 figs.; 8 tabs.

17382 **(KFKI—1986-37/A) Comment to the reanalysis of the Eoetvoes experiment.** Vecsernyes, P. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1986. 4p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700819.

A recent reanalysis of the classical Eoetvoes experiment - concerning the relation between the inertial and gravitational mass - shows strong correlation between the baryon number per unit mass of the samples and the deviations from the strict linearity measured by Eoetvoes. This result can be interpreted as an evidence for the existence of a new basic interaction of medium range, 'the fifth force'. Another possible candidate for carrying a new interaction is the lepton charge, the symmetric pair of the baryon charge in grand unified models. It is pointed out that the deviations from the null results in the Eoetvoes experiment do not correlate with the lepton charge per unit mass of the samples used by Eotvoes, only with their baryon charges. (D.Gy.). 4 refs.

17383 **(KFKI—1986-47/A) External field Dirac equation with separable potential.** Foeldy, L.; Toth, A.; Revai, J. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1986. 14p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700822.

The general form of the rotation, space reflection, time reversal and charge conjugation invariant separable potential for the Dirac equation is investigated. A concrete potential is constructed which reproduces the 1s/sub 1/2/ and 2p/sub 1/2/ eigenvalues of the nuclear Coulomb potential. 3 refs.; 4 figs.

17384 **(KFKI—1986-48/A) Coulomb pair-creation.** Hrasko, P.; Foeldy, L.; Toth, A. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Jul 1986. 58p. NTIS (US Sales Only), PC A04/MF A01. File Number DE87700823.

Electron-positron pair production in strong Coulomb fields is outlined. It is shown that the singular behaviour of the adiabatic basis can be removed if solutions of the time dependent external field Dirac equation are used as a basis to expand the fermion field operator. This latter 'asymptotic basis' makes it possible to introduce Feynman-propagator. Applying the reduction technique, the computation of all of the basic quantities can be reduced to the solution of an integral equation. The positron spectrum for separable potential model with Lorentzian time dependence and for potential jump is analyzed in the pole approximation. 21 refs.; 6 figs.

17385 **(KFKI—1986-51/B) Asymptotic behaviour of Robinson-Trautman pure radiation solutions.** Bicak, J.; Perjes, Z. (Hungarian Academy of Sciences, Budapest. Central Research Inst. for Physics). Aug 1986. 4p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87700825.

It is shown that spherical Robinson-Trautman space-times filled with a homogeneous time-varying radiation field approach the Vaidya metric as the retarded time goes to infinity. This is a generalization of an earlier result on the vacuum Robinson-Trautman space-times. 5 refs.

17386 **(LA-UR—87-22) A self-similar approach to the explosion of droplets by a high energy laser beam.** Chitanvis, S.M. (Los Alamos National Lab., NM (USA)). 30 Dec 1986. Contract W-7405-ENG-36. 4p. (CONF-861038—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005124.

From OSA/APS international laser science conference ↑; 0.

A model has been constructed in which a small droplet is exploded by the absorption of energy from a high energy laser beam. The beam flux is so high that it is assumed that a plasma is formed. A single-fluid model of a plasma droplet interacting with laser radiation is used. Selfsimilarity is invoked to reduce the spherically symmetric problem involving hydrodynamics and Maxwell's equations to quadrature. It is shown analytically that the model reproduces in qualitative manner certain features observed experimentally.

17387 **(NORDITA—85/16-Prepr.) Propagator of quantum gravity in minisuperspace.** Louko, J. (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)). Apr 1985. 23p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750530.

We study the quantum gravitational propagation amplitude between two spacelike three-surfaces in minisuperspaces where the supermomentum constraints are identically satisfied. We derive a well-defined path integral formula for the propagator and show that the propagator is an inverse of the canonical Hamiltonian operator. In an exactly solvable deSitter minisuperspace model the propagator is found to obey semi-classically correct boundary conditions. We discuss the implications for the full theory and suggest an approach to unravelling the physical meaning of the propagator.

17388 **General dimensional reduction of ten-dimensional supergravity and superstring.** Ferrara, S.; Porrati, M.; Kounnas, C. (California Univ., Los Angeles, USA. Dept. of Physics; California Univ., Berkeley, USA. Dept. of Physics; Lawrence Berkeley Lab., CA, USA). *Physics Letters [Section] B;* **181**: No. 3/4, 263-268(4 Dec 1986). Contract AA03-76SF00034.

Dimensional reductions of supergravity theories are shown to yield to specific glasses of four-dimensional no-scale models with N = 4, 2 or 1 residual supersymmetry. N = 1 "maximal" supergravity lagrangian, corresponding to the "untwisted" sector of orbifold

compactification of superstrings, contains nine families and has a no-scale structure based on the Kaehler manifold [SU(3, 3+3n)/ SU(3) x SU(3+3n)] x [SU(1, 1)/U(1)]. The quantum consistency of the resulting theories give information on the non Kaluza-Klein (string) "twisted" sector.

17389 **The new inflationary universe, 1984.** Guth, A.H. (Center for Theoretical Physics, MIT, Cambridge, MA 02139). pp 287-301 of Inner space/outer space. The interface between cosmology and particle physics. Kolb, E.W.; Turner, M.S.; Lindley, D.; Olive, K.; Seckel, D. Chicago, IL; University of Chicago Press (1986).

This article reviews the new inflationary universe scenario, placing particular emphasis on the basic features and motivations. This article summarizes some of the recent developments, and gives a simple explanation for the generation of density fluctuations.

17390 **Supersymmetric inflation: Recent progress.** Ovrut, B.A.; Steinhardt, P.J. pp 302-324 of Inner space/outer space. The interface between cosmology and particle physics. Kolb, E.W.; Turner, M.S.; Lindley, D.; Olive, K.; Seckel, D. Chicago, IL; University of Chicago Press (1986).

The new inflationary universe scenario is, in principle, a simple and powerful approach to resolving a large number of fundamental cosmological problems. However, in order for the scenario to be considered a complete theory, one critical question remains to be answered: What is the physics responsible for the phase transition that triggers the exponential expansion (inflation) of the universe? One possibility that the authors and several other groups have been pursuing is that the physics responsible for the phase transition involves (local) supersymmetry. The goal of this paper is to review the present status of "Supersymmetric Inflation", particularly emphasizing some very exciting results that they recently obtained.

17391 **The behavior of the Higgs field in the new inflationary universe.** Guth, A.H.; Pi, S. (Center for Theoretical Physics, MIT, Cambridge, MA 02139). pp 345-351 of Inner space/outer space. The interface between cosmology and particle physics. Kolb, E.W.; Turner, M.S.; Lindley, D.; Olive, K.; Seckel, D. Chicago, IL; University of Chicago Press (1986).

This article summarizes research concerning the quantum-mechanical treatment of the Higgs field in the context of the new inflationary universe. The research in this area is continuing, but so far a toy model is described which has been constructed and solved.

17392 **Inflation in a wall dominated universe.** Seckel, D. (MS # 209, Fermilab, P.O. Box 500, Batavia, IL 60510). pp 367-370 of Inner space/outer space. The interface between cosmology and particle physics. Kolb, E.W.; Turner, M.S.; Lindley, D.; Olive, K.; Seckel, D. Chicago, IL; University of Chicago Press (1986).

The authors examine the possibility that the Universe was, at some time in its past, dominated by topological domain walls. In particular, they discuss the possibility that such an epoch could solve the flatness and horizon problems. They conclude that such a model would not work. The problems of baryogenesis and density perturbations are discussed.

17393 **More dimensions - Less inflation.** Lindley, D. (MS# 209, Fermilab, P.O. Box 500, Batavia, IL 60510). pp 593-596 of Inner space/outer space. The interface between cosmology and particle physics. Kolb, E.W.; Turner, M.S.; Lindley, D.; Olive, K.; Seckel, D. Chicago, IL; University of Chicago Press (1986).

Even if the extra dimensions are stable today, it is an exciting idea that at an earlier cosmological time they may have been dynamically important. The major problem that arises is that somehow the extra dimensions must stop evolving, and settle into a stable, static configuration. In this simple model, this allows quantitative estimates of the consequences of such an unusual period in the early history of the Universe.

17394 **Supergravity: The basic and beyond.** de Wit, B.; Freedman, D.Z. (Inst. for Theoretical Physics, Utrecht). pp 135-210 of Supersymmetry. Dietz, K.; Flume, R.; Gehlen, G.; Rittenberg, V. New York, NY; Plenum Press (1985). (CONF-8408127—).

From NATO advanced study institute on supersymmetry; Bonn, F.R. Germany (20 Aug 1984).

The authors present the basics of supergravity in detail, assuming only some previous knowledge of Lagrangian field theory and some exposure to general relativity and tensor calculus. This is followed by an introduction to supergravity in antideSitter space, some of the ideas of the off-shell multiplet structure important for the construction of phenomenological models based on matter-coupled supergravity, and a recent Kaluza-Klein solution to 11-dimensional supergravity which clarifies the relation to gauged $\nu=8$ supergravity in four dimensions.

17395 **Towards a theory of fermion masses: A two-loop finite $\nu=1$global SUSY GUT.** Jones, D.R.T.; Raby, S. (Univ. of Colorado, Boulder, CO). pp 647-665 of Supersymmetry. Dietz, K.; Flume, R.; Gehlen, C.; Rittenberg, V. New York, NY; Plenum Press (1985). (CONF-8408127—).

From NATO advanced study institute on supersymmetry; Bonn, F.R. Germany (20 Aug 1984).

The authors discuss the constraints on fermion masses resulting from the requirement of finiteness in an $\nu=1$ supersymmetric theory. The presentation includes: conditions for finiteness, construction of a two-loop finite SU_5 gut, fermion masses, top quark mass, and a generalized two-loop finite SU_5 gut.

17396 **(CEA-CONF—8489) Electron acceleration by a localized electric field.** Galmiche, D.; Nicolle, J.P.; Pesme, D. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Nov 1985. 38p. (CONF-851128—4). NTIS (US Sales Only), PC A03/MF A01. File Number DE87750565.

From 17. European conference on laser interaction with matter; Rome, Italy (18 Nov 1985).

The acceleration of test electrons by a resonant one - dimensional electric structure is studied in the convective regime with the Zakharov equations. Depending on the nonlinearity level the particle acceleration is due to diffusion or trapping by the plasma wave. Electron distributions are obtained and compared with 1-D particle code results. Influence of Landau damping formulation is discussed.

17397 **(CEA-CONF—8492) Pulsed soft X-ray source for laser plasma diagnostics calibrations.** Bourgade, J.L.; Cavailler, C.; Mascureau, J. de; Miquel, J.L. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Mar 1986. 16p. (CONF-860324—33). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750457.

From High temperature plasma diagnostics; Hilton Head Island, SC, USA (9 Mar 1986).

Improvement in laser-plasma analysis makes it necessary to perform accurate calibration in the soft X-ray range. For this purpose we have modified a plasma Focus device (27 kJ, 40 kV, 400 kA) in order to enhance its soft X-ray emission: a hollow anode is used to prevent hard X-ray bremsstrahlung emission and a lot of filling gases are chosen for their characteristic lines in the keV and sub-keV range (Ne, Ar, O, N, CH_4). These emissions have been absolutely measured with a X-ray bolometer and can be used directly or indirectly (in the fluorescent mode: Mg Kα at 1.254 keV) for X-ray calibration of various diagnostics. Some detector calibrations in

pulsed regime (10 ns) are presented (Films, solid state PIN diodes, CCD arrays).

17398 **(CEA-CONF—8496) Absorption of aluminium X-ray lines in a laser created gold plasma.** Combis, P.; Busquet, M.; Louis-Jacquet, M. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Apr 1986. 7p. (CONF-8604224—6). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750566.

From International colloquium on X-ray lasers; Aussois, France (14 Apr 1986).

We have studied the absorption of aluminium X-ray lines through a gold plasma by focusing a high intensity laser-beam onto a specific target. Absorption in the wavelength range of 5 to 7 A has been evidenced and measured for Aluminium resonance lines.

17399 **(CEA-CONF—8512) Approximation of Fokker-Planck equation by a deterministic particle method.** Hermeline, F. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). May 1986. 27p. (In French). (CONF-8605206—1). NTIS (US Sales Only), PC A03/MF A01. File Number DE87750563.

From National congress on numerical analysis; Port Barcares, France (26 May 1986).

Fast ion transport in a plasma of electrons and ions is studied. The equation is simplified and discretized by a deterministic particle method. The way to computerize the method is shown. The energy deposition of ions in the plasma is calculated. Numerical applications are given (8 ref., 12 figs.).

17400 **(DOE/ER/10005—T1) Plasma diagnostics: Detection of laser scattering: Final report, September 1, 1978 to August 31, 1982.** Dutta, J.M.; Jones, C.R. (North Carolina Central Univ., Durham (USA). Dept. of Physics). [1985]. Contract FG05-78ER10005. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004416.

Submillimeter (SMM) radiation is the optimum radiation to use in studying some parameters of plasmas produced in Tokamak machines. The ultimate objective has been in constructing a low-noise SMM receiver suitable for application to the diagnosis of Tokamak plasmas. In this connection, a compact, stable SMM laser has been designed and constructed, and its performance as a local oscillator in the heterodyne detection has been tested. The performance of Schottky diodes as mixer elements has been evaluated by utilizing them in a quasi-optical modulation for the heterodyne generation of tunable sidebands.

17401 **(DOE/ET/53088—267) Simulation of ion cyclotron resonance heating through resonant absorption in two-ion species plasma.** Tajima, T.; Riyopoulos, S.; Demchenko, V. (Texas Univ., Austin (USA). Inst. for Fusion Studies; AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.). Jan 1987. Contract FG05-80ET53088. 14p. (IFSR—267). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004852.

Particle simulation of two-ion hybrid cyclotron resonance heating (ICRH) of a magnetized hydrogen plasma with deuteron minority by magnetosonic waves launched from the low magnetic field side is reported. Depending on the minority concentration, partial transmission and partial reflection of the incoming waves off the two-ion hybrid resonance layer occur, in contrast to the mode conversion mainly taking place during incidence from the high field side. Preferential minority heating is observed, as the minority cyclotron resonance is close to the two-ion hybrid resonance layer.

17402 (INIS-mf—10556-Vol.1, pp 144-149) **Magnetic reconnection in tokamaks.** Wesson, J.A. (JET Joint Undertaking, Abingdon, UK). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Four types of magnetic reconnection occurring in tokamaks play an important role in tokamak operation. They are known as the tearing mode, the sawtooth reconnection, the double tearing mode, and the disruption. Although not observed directly, their effects are detected in a wide range of diagnostic measurements. The basic properties of each type of reconnection and their topology in particular are discussed in detail. General theoretical ideas are illustrated by examples of experimental and numerical results. For better understanding of the subject, close cooperation with astrophysicists might be helpful. (J.U.).

17403 (INIS-mf—10556-Vol.1, pp 190-191) **Reverse flow and current filamentation in the nonlinear tearing mode.** Steinolfson, R.S. (Saint Andrews Univ., UK). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

When adequately resolved in numerical simulations, the convective velocity term produces reverse flow vortices inside the resistive diffusion layer for the physically interesting case of high Lundquist number (S ≧ 10/sup 4/) and long wavelength disturbances. These reverse vortices generate electric fields which ultimately give rise to magnetic topology changes (formation of an additional magnetic island) and current filamentation not seen in simulations at lower S values.

17404 (INIS-mf—10556-Vol.1, pp 170-176) **Radiation from turbulent plasmas.** Kuijpers, J. (Rijksuniversiteit Utrecht, Netherlands. Sterrewacht Sonnenborgh). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

Under astrophysical conditions the turbulent plasma state is very often met. Simultaneously, the high brightness temperature of the observed plasma radiation shows the importance of collective interactions. The first step in understanding radiation from turbulent plasmas is the weak turbulence theory. Within the framework of weak turbulence the following distinct emission processes are discussed: Cherenkov resonance, three wave coupling, and wave scattering on particles. The most important astrophysical applications of these processes are described. However, in a number of astrophysical situations it is still not clear how the detailed conversion of plasma waves into escaping radiation proceeds. For better understanding of strong turbulence effects further development of the strong turbulence theory is necessary. (J.U.).

17405 (INIS-mf—10556-Vol.1, pp 177-185) **Solitons in astrophysics.** Roberts, B. (Saint Andrews Univ., UK). 1984. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700737. (CONF-8408138—Vol.1).

From 6. general conference of the European Physical Society; Prague, Czechoslovakia (27 Aug 1984).

There are strong theoretical grounds and some supporting (but inconclusive) observational grounds for expecting solitons to occur in astrophysical plasmas, such as the Sun, the solar wind, and the magnetosphere. Solitons may arise whenever nonlinearity is balanced by dispersion. The large time and length scales of astrophysical plasmas favour the development of nonlinearity. Two causes of dispersion are reviewed, adopting the ideal MHD equations together with the generalized form of Ohm's law including the Hall current. Dispersion then arises either because of ion inertial effects or from inhomogeneities in the equilibrium state. A number of well-known equations are obtained including the Korteweg-de Vries, modified Korteweg-de Vries, derivative nonlinear Schroedinger, nonlinear Schroedinger, and Benjamin-Ono equations. The behaviour of both Alfven and magnetoacoustic waves is examined.

17406 **(IPP—2/280) Method to measure the suprathermal density distribution by electron cyclotron emission.** Tutter, M. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). May 1986. 16p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750502.

Electron cyclotron emission spectra of suprathermal electrons in a thermal main plasma are calculated. It is shown that for direction of observation oblique to the magnetic field, which decays in direction to the receiver, one may obtain information on the spatial density distribution of the suprathermal electrons from those spectra.

17407 (IPP—III/112) Evolution of radiation power profiles in ASDEX H-mode discharges. Mueller, E.R.; Janeschitz, G.; Smeulders, P. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Feb 1986. 45p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750504.

The paper compares radiation power profiles, energy exhaust and impurity radiation mechanisms of the two types of H-mode during neutral-injection heated divertor discharges in the tokamak ASDEX. The normal H-mode discharge that reaches a quasi-stationary state is characterized by moderate radiation power losses of the main plasma and by repetitive burst-like energy release from its outer half-radius zone into the divertor. In contrast, the burst-free variant of the H-mode shows superior energy and particle transport properties but becomes dominated by radiation power losses growing continuously up to 100% of the heating power input. The dynamic behaviour, i.e. the variation in time, of the iron concentration and the associated radiation power density at the plasma centre is hardly influenced by the kind of H-mode. But, if the concentration of metals with medium Z-value is raised to sufficiently high values in the burst-dominated H-mode plasma, e.g. by the accumulation of intrinsic iron, the burst-free (or burst-deficient) H-mode is triggered, which after a new accumulation period usually ends by a radiation collapse.

17408 (ITF—85-80-R) Echo in a magnetized low-turbulent plasma. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1985. 23p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701324.

The phenomena of spatial and temporal echoes in a magnetized plasma with lower hybrid turbulence are investigated theoretically. The echo signal is nonlinear response of the plasma to two successive external perturbations of the plasma density. Analytical expressions for the shape of the echo signal are found. 19 refs.; 2 figs.

17409 (ITP—85-73-E) Short-wave convective turbulence and anomalous electron thermal conductivity of a plasma. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1985. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701326.

Short-wave convective turbulence may be a cause of anomalous electron transport in a magnetically confined plasmas. The general statistical approach is applied to obtain stationary spectra of the short-wave convective plasma turbulence and to calculate the coefficients of turbulent electron thermal conductivity. 26 refs.

17410 (KFTI—85-6) Non-linear stage of beam instability in the absence of electron capture by a wave field. Rutkevich, B.N.; Rutkevich, P.B. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700826.

The system of two electron beams with V/sub 1/ and V/sub 2/(V/sub 1/ > V/sub 2/) velocities and equal densities (n/sub 1/ =n/sub 2/) is considered. The energy electron spread for each beam is assumed to be sufficiently small to avoid electron capture by the field of volumetric charge wave. Electrons move in space between two parallel conducting planes in a flat layer of small thickness 2R. Interplane distance 2H is arbitrary. The problem of development of beam instability is solved with provision for dispersion and weak non-linearity. Non-linear equation for a amplitude as a function of distance zeta is derived: S/sub 1/(d/sup 2/a)/(d zeta/ sup 2/))=S/sub 2/a+S/sub 3/a/sup 3/. The latter equation assumes solutions of two types: monotonously increasing one (at S/ sub 3/ > 0) and periodical one (at S/sub 3/ < 0), under conditions of linear instability (a/sub 1/ and a/sub 2/ coefficients are positive). In the case of ion compensation of a constant component of volumetric electron charge change of these conditions (S/sub 3/=0) is realized at p=((v/sub 1/-v/sub 2/)/w p=(v sub(1)-v sub(2)/w sub(p)$\sqrt{}$hH)=1.73, where w sub(p)=(4πl sup(2)n/m)sup(1/2), n/ sub 0/=n/sub 1/+n/sub 2/. At lower values of P parameter an explosive instability is observed and at higher values nonlinear stabilization occurs. 9 refs.

17411 (LA-UR—86-4153) Opacity calculations for laser plasma applications. Magee, N.H. Jr. (Los Alamos National Lab., NM (USA)). 1986. Contract W-7405-ENG-36. 15p. (CONF-861177—4). NTIS MF A01; 2; GPO Dep. File Number DE87003728.

From 9. international conference on lasers and applications; Orlando, FL, USA (3 Nov 1986).

The Los Alamos LTE light element detailed configuration opacity code (LEDCOP) has been revised to provide more accurate absorption coefficients and group means for modern radiation-hydrodynamic codes. The new group means will be especially useful for computing the transport of thermal radiation from laser deposition. The principal improvement is the inclusion of a complete set of accurate and internally consistent LS term energies and oscillator strengths in both the EOS and absorption coefficients. Selected energies and oscillator strengths were calculated from a Hartree-Fock code, then fitted by a quantum defect method. This allowed transitions at all wavelengths to be treated consistently and accurately instead of being limited to wavelength regions covered by experimental observations or isolated theoretical calculations. A second improvement is the use of more accurate photoionization cross sections for excited as well as ground state configurations. These cross sections are now more consistent with the bound-bound oscillator strengths, leading to a smooth transition across the continuum limit. Results will be presented showing the agreement of the LS term energies and oscillator strengths with observed values. The new absorption coefficients will be compared with previous calculations. 5 refs., 9 figs., 1 tab.

17412 (LRP—306/86) Broadband magnetic and density fluctuations in the TCA tokamak. Hollenstein, Ch.; Keller, R.; Pochelon, A.; Ryter, F.; Sawley, M.L.; Simm, W.; Weisen, H. (Centre de Recherches en Physique des Plasmas, Lausanne (Switzerland)). Sep 1986. 23p. (CONF-860711—2). NTIS (US Sales Only), PC A02/MF A01. File Number DE87900430.

From Small scale turbulence and anomalous transport in magnetized plasmas; Cargese, France (7 Jul 1986).

The results of comparative studies of broadband magnetic and density fluctuations during ohmic discharges in the TCA tokamak are described. Long coherence lengths are observed in poloidal and toroidal directions between magnetic probes in the scrape-off layer. A phase contrast diagnostic provides a newly accessible range of density fluctuations in the bulk plasma with very long wavelengths. Langmuir probes provide similar measurements in the scrape-off layer. Statistical dispersion relations for both density and magnetic fluctuations are deduced and are shown to be substantially different. Low mean poloidal wavenumbers ($m \sim 2$ at 100 kHz) are obtained for the magnetic fluctuations, in contrast to the much higher values measured for density fluctuations. The difference between magnetic and density fluctuations is also reflected in different scalings with plasma parameters and with electron confinement time. The helicity of the coherent magnetic structures is analyzed to show that interior regions of the plasma, such as the $q = 2$ region, contribute to the magnetic activity at the edge. This explains why the magnetic fluctuations measured at the edge are likely to reflect the confinement properties of the bulk plasma. The results of detailed probe rotation experiments and coherence measurements give indications of the physical nature and origin of magnetic fluctuations.

17413 (N—87-13307) Space plasma research. Final report, August 1980-August 1986. Comfort, R.H.; Horwitz, J.L. (Alabama Univ., Huntsville (USA)). Sep 1986. 26p. (NASA-CR—178965; NAS—1.26:178965). NTIS, PC A03/ MF A01.

Four basic areas were covered: development of analysis techniques and software and numerical simulations; data analysis and interpretation; spacecraft sheath studies; and laboratory studies. The important details were documented in terms of either appropriate software documentation or publication in referred publication, conference proceeding and technical reports. The major accomplishments are summarized, followed by a chronological listing of the publications and presentations which resulted from the research.

17414 **(NIIEFA-P-K—0681) Calibration of thermonuclear neutron detectors.** Burtsev, V.A.; Kuz'min, V.A.; Loskutov, N.A.; Popytaev, A.N.; Ramendik, Z.A.; Titov, V.A.; Shchebolev, V.T. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 26p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700845.

Experiments dealing with determination of efficiency of different devices developed for diagnostics of neutron radiation of dense thermonuclear plasma on pulsed facilities are described. Technique for calibration of scintillation detectors not requiring use of pulsed neutron sources is suggested. Ratios for determination of accuracy of neutron fluence measuring by means of scintillation detectors are obtained. 25 refs.; 6 figs.

17415 **(ORNL/TM—9475) The "ring killer" experiment: Electron confinement in the ELMO Bumpy Torus without the influence of hot-electron rings.** Hillis, D.L.; Wilgen, J.B.; Cobble, J.A.; Davis, W.A.; Hiroe, S.; Rasmussen, D.A.; Richards, R.K.; Uckan, T.; Jaeger, E.F.; Hankins, O.E. (Oak Ridge National Lab., TN (USA)). Nov 1986. Contract AC05-84OR21400. 30p. NTIS, PC A03/MF A01; GPO Dep. File Number DE87005270.

The ELMO Bumpy Torus (EBT) [Plasma Physics and Controlled Nuclear Fusion Research (IAEA, Vienna, 1975), Vol. II, p. 141] normally has an energetic electron ring in each of its 24 mirror sectors. The original intention of using this hot-electron population was to provide an average local minimum in the magnetic field (through its diamagnetism) to stabilize the simple interchange and flute modes, which otherwise are theoretically inherent in a closed-field-line bumpy torus. To study the confinement properties of a bumpy torus without the influence of hot-electron rings, a water-cooled stainless steel limiter in each mirror sector was extended into the plasma to the ring location; this eliminated the hot-electron ring population. These limiters were aptly named "ring killers." Electron temperature, density, space potential, and plasma fluctuations have been measured during the ring killer experiment and are compared to standard EBT operation. The results of these experiments indicate that the hot-electron rings in EBT do enhance the core plasma properties of EBT and do, in fact, reduce plasma fluctuations; however, these improvements are not large in magnitude. These measurements and recent theoretical models suggest that simple interchange/flute modes are stabilized, or fluctuation levels reduced, well before that condition is obtained for average minimum-B stabilization. Several possible mechanisms for this stabilization are discussed.

17416 **(RISO-M—2594) Electron cyclotron resonance heating of a high-density plasma.** Hansen, F.R. (Risoe National Lab., Roskilde (Denmark); Danmarks Tekniske Hoejskole, Lyngby). Jul 1986. 90p. NTIS (US Sales Only), PC A05/MF A01. File Number DE87750857.

Various schemes for electron cyclotron resonance heating of tokamak plasmas with the ratio of electron plasma frequency to electron cyclotron frequency, ω/sub pe//ω/sub ce/, larger than 1 on axis, are investigated. In particular, a mode conversion scheme is investigated using ordinary waves at the fundamental of the electron cyclotron frequency. These are injected obliquely from the outside of the tokamak near an optimal angle to the magnetic field lines. This method involves two mode conversions. The ordinary waves are converted into extraordinary waves near the plasma cut-off layer. The extraordinary waves are subsequently converted into electrostatic electron Bernstein waves at the upper hybrid resonance layer, and the Bernstein waves are completely absorbed close to the plasma centre. Results are presented from ray-tracing calculations in full three-dimensional geometry using the dispersion function for a hot non-relativistic plasma. Radial profiles for the power deposition and the non-inductive wave-driven current due to the Bernstein waves are calculated for realistic antenna radiation patterns with parameters corresponding to the Danish tokamak DANTE and to Princeton's PLT. With 1 tab., 28 figs., 38 refs.

17417 **(UCID—17530-87-Rev.6) The Computational Physics Program of the National MFE Computer Center.** Mirin, A.A. (Lawrence Livermore National Lab., CA (USA)). Jan 1987. Contract W-7405-ENG-48. 52p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005268.

The computational physics group is involved in several areas of fusion research. One main area is the application of multidimensional Fokker-Planck and transport codes to tokamaks and compact toroids. Another major area is the investigation of resistive magnetohydrodynamics in three dimensions, with applications to compact toroids and reversed field pinches. A third major area is the investigation of kinetic instabilities using a 3-D particle code. This work is often coupled with the task of numerically generating equilibria which model experimental devices. In addition to these computational physics studies, the group is making a major effort at ascertaining how to efficiently utilize multiprocessor computers.

17418 **Determination of gross plasma equilibrium from magnetic multipoles.** Kessel, C.E.; Firestone, M.A. (Fusion Engineering and Physics Program, Mechanical, Aerospace and Nuclear Engineering Dept., Univ. of California, Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1177-1184(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A new approximate technique to determine the gross plasma equilibrium parameters, major radius, minor radius, elongation and triangularity for an up-down symmetric plasma is developed. It is based on a multipole representation of the externally applied poloidal magnetic field, relating specific terms to the equilibrium parameters. The technique shows reasonable agreement with free boundary MHD equilibrium results. The method is useful in dynamic simulation and control studies.

17419 **An alpha particle distribution function for mirror loss-cone type instability calculations.** Ho, S.K.; Smith, G.R.; Nevins, W.M.; Miley, G.H. (Fusion Studies Lab., Dept. of Nuclear Engineering, Univ. of Illinois, Urbana, IL 61801). *Fusion Technology;* **10**: No. 3, 1171-1176(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The modeling of the steady-state fusion-born alpha particle distribution in a mirror loss-cone is investigated. The Legendre function expansion and diffusion-front methods are reviewed and examined. The diffusion-front method is shown to be am accurate and efficient method are alpha-loss-cone instability calculations in a tandem mirror fusion device.

17420 **Recent operation of the tandem mirror experiment-upgrade.** Hill, D.N. (Lawrence Livermore National Lab., Livermore, CA). pp 2P-1 of IEEE conference record-abstracts of the 1985 IEEE international conference on plasma science. Piscataway, NJ; IEEE Service Center (1985). (CONF-850699—). Contract W-7405-ENG-48.

From Conference on plasma sciences; Pittsburgh, PA, USA (3 Jun 1985).

The authors discuss current results of thermal barrier operation of TMX-U. In this device, axial particle confinement is provided by increased electrostatic potentials in the outboard mirror cells (end plugs). These potential peaks are sustained by a combination of neutral-beam injection and high-power (250 kW per plug) microwave heating (ECRH) at both the fundamental and second harmonic of the electron-cyclotron frequency. At the plug midplane, the second harmonic ECRH produces a potential minimum (the thermal barrier), which reduces the flow of cold electrons to the regions of high ion-confining potential. Recent experiments have examined thermal barrier formation at central-cell densities (n/sub cc/ — 10/sup 12/ cm/sup -3/), using data from several new diagnostics, including an end-loss ion spectrometer and a system of X-ray spectrometers. Related experiments have sought to increase the energy confinement of hot mirror-trapped ions in the central cell. This is important for thermal-barrier operation because barrier filling by cold ions escaping from the central cell can limit high density operation. Analysis of data from a charge-exchange analyzer and Thomson scattering shows that the energy confinement is

limited by a combination of charge exchange and electron drag. Current efforts at reducing the charge exchange loss are focused on control of the edge-plasma density, temperature, and fueling using both ion-cyclotron rf heating and a set of biased limiter plates to inject low energy neutrals into the core plasma. New information about neutral penetration and fueling efficiencies under these conditions has been provided by a high speed camera imaging Balmer-alpha emission from atomic neutrals.

17421 **Neutral beam probe for potential measurements in Phaedrus minimum-B end plug.** Saadatmand, K.; Woo, J.T. (Interscience, Inc., Troy, NY). pp 2C-5 of IEEE conference record-abstracts of the 1985 IEEE international conference on plasma science. Piscataway, NJ; IEEE Service Center (1985). (CONF-850699—).

From Conference on plasma sciences; Pittsburgh, PA, USA (3 Jun 1985).

A principal mission of the Phaedrus tandem mirror experiment at the University of Wisconsin is to study techniques and effects of shaping the axial and radial ambipolar potential profiles. The Phaedrus end plug can be operated in either axisymmetric or minimum-B configurations and the three-dimensional space charge potential distributions in both cases are of interest. The authors have developed a neutral beam probe system design capable of mapping out both axial and radial potential profiles throughout most of the end plug regions of interest. The design features a cesium ion beam that is swept both axially and radially, coupled to a cesium curtain neutralizer to form the neutral primary beam. The singly ionized secondaries are detected by a parallel plate electrostatic energy analyzer with an elongated entrance aperture aligned along the axis of the end plug system. The secondaries originating from different spatial points can be directed into the slit aperture by energy modulation of the primaries. For axisymmetric end plugs, the trajectories remain in a plane. The effect of the quadrupoles associated with the minimum-B configuration is to introduce a shear along the axis, which is accommodated by the use of this split aperture. Therefore, a single diagnostic implementation can be used to map out the three dimensional space charge potential distributions in the end plugs for both the simple mirror and minimum-B configurations. An option to include multiple sources also aligned along the system axis is also included to provide the capability for measuring the wavelength of the fluctuations. The basic design appears to be quite general and should be scalable to other tandem mirror systems. For the parameters of the Phaedrus experiment, spatial resolutions on the order of fractional cubic centimeters and sensitivity of several volts are expected.

17422 **Nd:Glass lasers for Thomson scattering plasma diagnostics on the compact toroid transport experiment.** Dooling, J.C.; Niimura, M.; York, T.M. (Depts. of Electrical and Aerospace Engineering, The Pennsylvania State Univ., University Park, PA). pp 2C-2 of IEEE conference record-abstracts of the 1985 IEEE international conference on plasma science. Piscataway, NJ; IEEE Service Center (1985). (CONF-850699—).

From Conference on plasma sciences; Pittsburgh, PA, USA (3 Jun 1985).

A high-brightness, low-divergence Nd:Glass laser system for Thomson scattering plasma diagnostics is described. The laser oscillator operates in the TEM/sub oo/ mode; its output beam is then amplified sing two or three single-pass Nd:Glass amplifiers for maximum output energies at 1054 nm in the range of 10 to 60 Joules. Experimentally determined laser parameters are described. KDP crystals are also employed for second harmonic generation (SHG) for Thomson scattering experiments at 527 nm. Detection of the scattered photons at 1054 nm and 527 nm is accomplished using avalanche photodiodes (APDs) and photo multiplies tubes (PMTs), respectively. Though the detection of low light level signals is straightforward with PMTs, respectively, this is not the case with APDs. Silicon APDs have high quantum efficiencies (35-40 percent at 1054 nm) but relatively low gain (50-100). The APD output must be amplified considerably in order to compete with the PMT operating in the neighborhood of 527 nm. An amplification system to overcome this problem is presented. Also, a gain monitoring system for insitu measurements allowing for absolute gain determination on each Thomson scattering shot has been developed for the APDs. Temperature and density measurements from Thomson scattering tests conducted on the Compact Toroid Transport Experiment (CTTX) are presented. This data are compared with results from other diagnostics used on CTTX, such as spectroscopy and diamagnetic loops.

17423 **Parallel current flow in the Phaedrus tandem mirror machine.** Brouchous, D.A.; Breun, R.A.; Severn, G.D.; Sing, D. (Nuclear Engineering Dept., Univ. of Wisconsin, Madison, WI). pp 2P-3 of IEEE conference record-abstracts of the 1985 IEEE international conference on plasma science. Piscataway, NJ; IEEE Service Center (1985). (CONF-850699—).

From Conference on plasma sciences; Pittsburgh, PA, USA (3 Jun 1985).

MHD equilibrium in a tandem mirror with quadrupole end cells requires currents to flow parallel to magnetic field lines in the presence of high beta plasma. These currents have a quadrupole nature and give a net current of zero. Experiments have been performed in the Phaedrus tandem mirror device in order to measure parallel current densities in the central cell and transition regions. Three types of diagnostics were used to measure current densities; Rogowsky loops, magnetic pickup coils, and two sided Langmuir probes. A net current of 45 amps flowing toward the east plug was measured in the Phaedrus central cell. A quadrupole current is seen near the axis when the 45 amp net current is subtracted from local current measurements. Current measured with collecting rings mounted on the end walls show 10 amps of current flowing to the east end wall. Possible causes of the 45 amp current include an asymmetry in plug potentials between the east and west plugs, and an off axis density peak in the central cell.

17424 **High-frequency broadband emission from turbulent plasmas.** Weatherall, J.C.; Hobbs, W.E. (General Dynamics, Pomona Div., P.O. Box 2507, Pomona, CA). pp 3C-6 of IEEE conference record-abstracts of the 1985 IEEE international conference on plasma science. Piscataway, NJ; IEEE Service Center (1985). (CONF-850699—).

From Conference on plasma sciences; Pittsburgh, PA, USA (3 Jun 1985).

Super-strong turbulence in beam-plasma systems is characterized by intense, broadband radiation. While emission near the plasma frequency and near twice the plasma frequency can be studied by weak turbulence theory as the interaction of Langmuir waves in the plasma, the apparent radiation at higher frequencies is puzzling. Evidently at large amplitude the turbulence exhibits a broad frequency response above the plasma frequency. The authors investigate the possibility that this is due to the non-sinusoidal waveform of large amplitude charge-density waves. The model for the electrostatic turbulence is a monochromatic wave solution for a large amplitude plasma wave in a cold plasma. This solution exhibits considerable electron bunching and, because of the amplitude-dependent shape of the waveform, higher harmonic components. The authors do not solve for the time evolution of the wave beyond the simple time behavior of the initial wave oscillation. The source region is assumed to have a finite size. Then the calculation of the electromagnetic vector potential is done by standard methods for simple radiating systems. The resulting power radiated is expressed in terms of a coupling efficiency which represents the fraction of plasmon energy lost per cycle per unit solid angle per electron into the s-harmonic of the plasma frequency. The coherent radiation is proportional to the square of the number of radiating electrons in the system. The radiation power spectrum depends sensitively on the wave amplitude and the size of the (coherent) source region. When the scalelength of the emitting region is much larger than a radiative wavelength, the emission can be predominantly in the higher harmonics. The theory also predicts that the higher harmonic emission is beamed at small angles relative to the direction of the Langmuir oscillation.

From 4. European nuclear conference and 9. FORATOM congress (ENC '86) and international nuclear trade fair; Geneva, Switzerland (1 Jun 1986).

Attractive properties are thermal stability, weak corrosion of structures at the expected working temperatures, satisfactory irradiation behaviour and tritium release. Within the EEC fusion technology program, a thorough investigation of this compound has been undertaken by CEA since 1982. Our main effort has addressed the following aspects which are detailed in this paper: Fabrication. Characterization namely physico-chemical, thermal, mechanical. Compatibility with 316 L stainless steel. Irradiation behaviour. Study of the mechanism and kinetics of tritium release both from out of pile and in pile experiments. The influence of the material microstructure and of fabrication procedures on the relevant properties has been specially looked into.

From 13. international symposium on the effects of radiation on materials; Seattle, WA, USA (23 Jun 1986).

Studies about controlled fusion reactor of the Tokamak type require the examination of the radiation effects on the behaviour of various potential materials. Thus, in the first part of this paper, are presented the devices adapted to these materials studies and used in the OSIRIS reactor. In a second part, is described an experiment of irradiation ceramics used as candidates for breeding material and are given the first results.

17430 **(CEA-CONF—8557) PHEBUS: a new powerful laser facility for ICF research.** Andre, M.; Coudeville, A.; Dautray, R. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Sep 1986. 4p. (CONF-860917—8). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750461.

From 14. SOFT - symposium on fusion technology; Avignon, France (8 Sep 1986).

The new laser system called Phebus recently settled by the Centre d'Etudes of Limeil-Valenton is presented, together with the wide range of diagnostic tools allowed to be setted in the vacuum vessel. Research directions of target fabrication are also given.

17431 **(CEA-CONF—8564) Model for the acceleration of laser irradiated targets.** Babonneau, D.; Di Bona, G.; Fortin, X. (CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France)). Nov 1986. 23p. (CONF-8610162—1). NTIS (US Sales Only), PC A02/MF A01. File Number DE87750571.

From 7. international workshop on laser interaction and related plasma phenomena; Monterey, CA, USA (28 Oct 1986).

Starting from the self-similar propagation of an electronic conduction wave and the consequent ablation pressure, we describe, in a simplified way, the shock ahead of this wave, then the effects of the rarefaction and compression waves which follow the shock emergence at the target rear surface. So, we obtain the temporal evolution of the rear velocity which is compared with the experimental one. For thick targets, the shock alone is able to emerge during the experimental time and consequently gives the velocity vsub(min). For thin targets, besides the shock accumulation mechanism, it is necessary to take into account the electronic heat wave emergence that is to say the "complete" ablation of the target which gives the velocity vsub(max).

17432 **(CONF-870301—10) Maintenance features of the Compact Ignition Tokamak fusion reactor.** Spampinato, P.T.; Hager, E.R. (Oak Ridge National Lab., TN (USA); GA Technologies, Inc., San Diego, CA (USA)). 1987. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004062.

From International topical meeting on remote systems and robotics in hostile environments; Pasco, WA, USA (29 Mar 1987).

The Compact Ignition Tokamak (CIT) is envisaged to be the next experimental machine in the US Fusion Program. Its use of deuterium/tritium fuel requires the implementation of remote handling technology for maintenance and disassembly operations. The reactor is surrounded by a close-proximity nuclear shield which is designed to permit personnel access within the test cell, one day after shutdown. With the shield in place, certain maintenance activities in the cell may be done hands-on. Maintenance on the reactor is accomplished remotely using a boom-mounted manipulator after disassembling the shield. Maintenance within the plasma chamber is accomplished with two articulated boom manipulators that are capable of operating in a vacuum environment. They are stored in a vacuum enclosure behind movable shield plugs.

17433 **(IAEA-R—3178-F) Impact desorption cross section studies of impurity release into magnetically confined plasmas. Final report for the period 1 July 1982-31 December 1985.** (International Atomic Energy Agency, Vienna (Austria)). Feb 1986. 13p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701284.

This report covers two distinct topics, the experimental measurement of cross sections for the desorption of oxygen induced by ion bombardment, and a study of the surface damage on the electron induced desorption of oxygen from tungsten. The desorption of oxygen induced by ion bombardment was studied for thin oxide layers on Mg, Si, and Al targets using 4 keV Ar ions and for absorbed oxygen on MgO using Kr, Ar, Ne, and He ions of 4 keV. 17 refs, 9 figs, 2 tabs.

17434 **(IAEA-TECDOC—388) Fusion safety status report.** (International Atomic Energy Agency, Vienna (Austria)). Oct 1986. 324p. NTIS (US Sales Only), PC A14/MF A01. File Number DE87700709.

This report includes information on a) tritium handling and safety; b) activation product generation and release; c) lithium safety; d) superconducting magnet safety; e) operational safety and shielding; f) environmental impact; g) recycling, decommissioning and waste management; and h) accident analysis. Recommendations for high priority research and development are presented, as well as the current status in each area. 322 refs, 7 figs, 8 tabs.

17435 **(IPP—9/47) Surface analysis of a central part of the JET graphite limiter.** Ehrenberg, J.; Behrisch, R. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Jun 1984. 27p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750506.

The content of this report was previously published in IPP-JET–23.

A central part (tile 4) of the carbon limiter of JET from octant 4, which was used in the period from July 1983 to December 1983 was analysed with regard to its surface composition and topography by PIXE, RBS, SEM and EIXE. For reference, a graphite sample from a limiter tile which had not been incorporated in JET and a section of a graphite piece cut from the limiter were also investigated. The elements found most frequently on the rough (propor to10 μm) graphite surface were Mo (10/sup -20/-10/sup 21/ atoms/m/sup 2/), Ni (10/sup 20/-10/sup 21/ atoms/m/sup 2/), Cr (10/sup 19/-10/sup 20/ atoms/m/sup 2/), Fe (10/sup 19/-10/sup 20/ atoms/m/sup 2/), Ti (10/sup 18/-10/sup 19/ atoms/m/sup 2/), Ca (10/sup 19/ atoms/m/sup 2/) and K (10/sup 19/ atoms/m/sup 2/). Mo, Ni and Cr were also found on tile 1 of the same limiter analysed by Culham Laboratories by means of RBS and other methods.

17436 **(ITEF—145(1985)) Equations of one-dimensional radiative hydrodynamics with thermal conductivity and kinetics of thermonuclear burning.** Basko, M.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1985. 58p. (In Russian). NTIS (US Sales Only), PC A04/MF A01. File Number DE87700748.

Basic equations and formulae permitthing to calculate important physical processes of the controlled thermonuclear fusion with inertial plasma confinement are presented. The formulated equation system is oriented on the target irradiation by heavy ions beams. Equations of two-temperature one-liquid one-dimensional hydrodynamics taking into account the exchange of energy, momentum and mass with fast (epithermal) α particles, neutrons and irradiation field are found. A quasidiffusion approximation describing the energy transport of α particles, neutrons and radiation is formulated. The diffusion equation in a three-temperature approximation is also obtained. Universal formulae for kinetic coefficients (coefficients of absorption of α-particles, neutrons and radiation, coefficients of temperature relaxation and these of electron and ion heat conductivity), true both in cold and hot plasma at high energy concentration, are presented. 34 refs.; 1 fig.

17437 **(KFK—4113) Theoretical assessment of a proposal for the simplified determination of critical loads of elastic shells.** Malmberg, T. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Kernfusion). Aug 1986. 111p. NTIS (US Sales Only), PC A06/MF A01. File Number DE87750507.

Within the context of the stability analysis of the cryostat of a fusion reactor the question was raised whether or not the rather lengthy conventional stability analysis can be circumvented by applying a simplified strategy based on common linear Finite Element computer programs. This strategy involves the static linear deformation analysis of the structure with and without imperfections. For some simple stability problems this approach has been shown to be successful. The purpose of this study is to derive a general proof of the validity of this approach for thin shells with arbitrary geometry under hydrostatic pressure or dead loading along the boundary. This general assessment involves two types of analyses: 1) A general stability analysis for thin shells; this is based on a simple nonlinear shell theory and a stability criterion in form of the neutral (indifferent) equilibrium condition. This result is taken as reference solution. 2) A general linear deformation analysis for thin imperfect shells and the definition of a suitable scalar parameter (β-parameter) which should represent the reciprocal of the critical load factor. It is shown that the simplified strategy (=β-parameter approach") generally is not capable to predict the actual critical load factor irrespective whether there is a hydrostatic pressure loading or dead loading along the edge of the shell. This general result is in contrast to the observations made for some simple stability problems. Nevertheless, the results of this study do not exclude the possibility that the simplified strategy will give reasonable approximate solutions at least for a restricted class of stability problems.

17438 **(KFK—4120) Automatic path-planning for a multilink articulated boom within the torus of a fusion reactor.** Smidt, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Aug 1986. 19p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87750503.

For in-torus maintenance of fusion machines a manipulator is conveyed to the working area by a multilink-transporter, also called 'articulated boom'. Systems of this type have in general four to five links and move in the midplane of the torus. They are kinematically redundant and have a very restricted working space. In this paper automatic methods for the collision free approach of any position of the final joint within the reach of the transporter are presented, including insertion and removal. By automatic teach-in with the CAD-simulation a table of safe configurations can be generated and supplemented by a fine-positioning algorithm.

17439 **(LA—10830-C, pp 1-4) Recent progress of S-1 experiments.** Ellis, R. Jr.; Hart, G.W.; Janos, A.; Levinton, F.; Meyerhofer, D.D.; Mimura, M.; Paul, S.; von Goeler, S.; Yamada, M.; Young, P. (Princeton Univ., NJ). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—). Contract AC02-76CH03073.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The experimental operation of the S-1 spheromak began in 1983 and the addition of stabilizing coils and improvements in vacuum conditions have since then led to increases in plasma parameters which are described here. Investigations into the scaling of the electron temperature with various parameters and the stabilization of the plasma are discussed. Attainment of the Taylor minimum energy state has been verified. Future plans call for achieving the design plasma current and possibly increasing that value by installation of a transformer along part of the symmetry axis.

17440 (LA—10830-C, pp 5-8) **Internal magnetics of the S-1 Spheromaks.** Hart, G.W.; Janos, A.; Yamada, M.; Young, P.E. (Princeton Univ., NJ). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—). Contract AC02-76CH03073.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Of fundamental importance to understanding the physics of Spheromaks is the concept of the Taylor minimum energy state. By examining the structure of the magnetic fields, it is evident that the plasma formed in S-1 does indeed evolve into a Taylor state, in that the ratio of current density to field is a constant in space. This implies that the pressure gradient is zero and that I(psi) is linear. Both of the above effects have been independently verified in these discharges.

17441 (LA—10830-C, pp 9-12) **Global magnetic fluctuations in S-1 spheromak plasmas and relaxation toward a minimum-energy state.** Janos, A.; Hart, G.W.; Yamada, M. (Princeton Univ., NJ). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—). Contract AC02-76CH03073.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Globally coherent modes have been observed during formation in the S-1 Spheromak plasma. These modes play an important role in flux conversion and plasma relaxation toward a minimum-energy state. A significant finding is the temporal progression through the n = 5, 4, 3, 2; m = 1 mode sequence as q rises through rational fractions m/n. Peak amplitudes of the modes relative to the unperturbed field are typically less than 5%, while amplitudes as high as 20% have been observed.

17442 (LA—10830-C, pp 13-16) **Methods for examining the particle and energy confinement in S-1.** Meyerhofer, D.D.; Goldston, R.J.; Hart, G.W.; Levinton, F.M.; Mimura, M.; Yamada, M. (Princeton Univ., NJ). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Spheromaks are now entering parameter regimes where the study of plasma confinement and transport can be initiated. The purpose of this paper is to discuss some of the methods used in a preliminary examination of the particle and energy confinement in S-1. Various techniques for examining the particle and energy balance in S-1 are discussed with a particular set of discharges used as an example. In the future more experimental data will be taken to understand the particle and energy confinement in the S-1 spheromak. In addition a 1 1/2 D transport code is being written and will be used to enhance their understanding of the spheromak plasma.

17443 (LA—10830-C, pp 17-20) **Measurements of radiated power from the S-1 spheromak.** Paul, S.F.; Meyerhofer, D.D.; von Goeler, S.; Sperduti, A.; Yamada, M. (Princeton Univ., NJ). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The S-1 spheromak is a compact toroid whose toroidal and poloidal fields are transferred inductively from a toroidal flux core into the surrounding plasma. In addition to the issues of formation and stability, a primary goal of the S-1 device is to produce a spheromak that is not radiation dominated, so that the transport and confinement properties can be investigated. The plasma parameters which have been used as a guide to roughly identify entry into that regime are temperatures high enough and particle confinement times long enough to ionize most of the low-Z impurities to a helium-like ionization state. It is desired to measure radiative power so that its contribution to the total power balance can be ascertained. This information is used to determine the limits on electron temperature. Measuring the power loss resulting from magnetic effects such as flux conversion and magnetic field fluctuations is also planned. Another purpose of measuring the radiated power is to aid in identifying the relative benefits of impurity reduction techniques such as greater detaching of the poloidal flux from the core, increased stabilization, increased poloidal current, pre-ionization, and improved vacuum conditioning in the form of increased pumping capability and pulsed gas filling. Each of these is believed to have contributed to the increase in the electron temperature. Three experiments have been designed to measure radiated power: (1) a time-resolved emitted power diagnostic (pyroelectric detector); (2) a calibrated time-integrated energy diagnostic (platinum bolometer); (3) a time, space, and energy-resolved radiated power measurement, an ultra-soft X-ray detector array.

17444 (LA—10830-C, pp 21-24) **Summary of electron temperature and density measurements in the S-1 spheromak.** Levinton, F.M.; Hart, G.W.; Meyerhofer, D.D. (Princeton Univ., NJ). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—). Contract AC02-76CH03073.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Electron temperature and density measurements have been made in the S-1 spheromak using a movable single point Thomson scattering system and a triple Langmuir probe. The Thomson scattering diagnostic is shown. A 15 Joule ruby laser beam is focused into the plasma at one of several positions along the major radius. Scattered light is collected by a 20 cm lens and imaged onto a fiber optic bundle which transmits the light to an 8 channel polychromator. The signal is digitized and recorded by two LeCroy 2249A ADC's. The first unit is gated at the same time the signal arrives, while the second unit is gated 150 ns later in order to subtract the background light. A triple Langmuir probe has been built to measure the electron temperature and density in S-1 as a function of time. The probe is a double Langmuir probe biased to collect the ion saturation current. The third tip measures the floating potential of the plasma. The voltage difference between the more positive tips and the floating potential is proportional to the electron temperature and from the ion saturation current the electron density is measured. The probe can also be moved to obtain profile information which has been used for particle and energy confinement studies. Data have shown the temperature increases with the total plasma current. Also results from a 0-D model have been consistent with measurements of the electron temperature and density. In the near future they hope to install a multipoint Thomson scattering system. This, in conjunction with additional diagnostic information and a 1 1/2-D transport code under development, will help further progress towards understanding confinement and transport of spheromaks.

17445 (LA—10830-C, pp 25-28) **Initial VUV spectroscopy results from S-1 spheromak.** Mimura, M.; Meyerhofer, D.D.; Paul, S.F.; Young, P. (Princeton Univ., NJ). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Recently GISMO[1](Grazing Incidence Spectrograph Monochromator) system was installed on S-1[2] to measure the impurity lines in the VUV region. The main objective of this measurement is to identify the impurity ions in S-1 and evaluate the line radiation loss due to them. Several VUV lines of H, C, D ions were observed in S-1 plasma. An example of the temporal behavior of oxygen ion lines is shown. A method to evaluate the particle confinement time was tried by comparing the time history of the oxygen lines with the calculation of zero dimensional rate equations. The particle confinement time was estimated to be 0.05 msec-0.4 msec.

17446 (LA—10830-C, pp 29-33) **Measurement of the line tying current pattern in the proto S-1/C tilt stabilizing structure.** Wysocki, F.J. (Princeton Univ., NJ). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The Proto S-1/C spheromak device has been used in the past few years to study various tilt stabilization techniques. As the importance of the line tying effect became recognized, a more thor-

ough understanding of the underlying physics was desired. Complex computer modeling of spheromak tilting dynamics using 3-D resistive MHD supported the experimental observations of the effectiveness of line tying, but a true insight into the basic physics is needed. The most recent evolution of the Proto S-1/C stabilizers have allowed easy measurement of the perturbed current pattern during tilting, and the line tying currents have been identified. The experimental patterns are found to be consistent with a proposed simple physical model of line tying, and provide a better understanding of the power and pitfalls of relying on line tying for the enhancement of tilt stabilization.

17447 (LA—10830-C, pp 34-38) **Los Alamos Spheromak Program.** Jarboe, T.R. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The Los Alamos Spheromak has two experimental facilities. The confinement properties of sustained and decaying spheromaks are being studied in CTX. Electrodes for the production of clean sustained spheromaks are being developed on the Electrode Studies Facility.

17448 (LA—10830-C, pp 39-43) **Determination of CTX equilibria.** Knox, S.O.; Barnes, C.W.; Marklin, G.J.; Jarboe, T.R.; Henins, I.; Hoida, H.W.; Wright, B.L. (Los Alamos National Lab., NM). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The method by which they determine the magnetic field equilibrium for CTX in a nonperturbing manner is presented. Measurements of flux conserver image currents are combined with calculations from a numerical model of the equilibrium. Results give equilibria which differ significantly from the minimum energy state, but the equilibria data are well-described by a model where j/B has a linear dependence on the poloidal flux function. The observation of non-disruptive rotating internal kink distortions (with toroidal mode numbers n = 1, 2 and 3) within the equilibria and theoretical MHD thresholds for the onset of these modes corroborate the inferred equilibria.

17449 (LA—10830-C, pp 44-48) **Increased particle confinement with the use of external dc bias field in the CTX spheromak.** Barnes, C.W.; Hoida, H.W.; Henins, I.; Fernandez, J.C.; Jarboe, T.R.; Marklin, G.J. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Spheromaks are formed in a mesh flux conserver in the presence of an external dc bias field. The spheromaks remain stable to tilt instabilities with ratios of bias-to-spheromak flux of up to 47 +/- 7%. Normally applied bias flux puts the spheromak separatrix inside the metal mesh and improves the particle confinement.

17450 (LA—10830-C, pp 49-53) **Local drift parameter, j/n/sub e/ and resistivity anomaly measurements in CTX spheromaks.** Hoida, H.W.; Barnes, C.W.; Henins, I.; Jarboe, T.R.; Buchenauer, C.J.; Marklin, G. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The ratio of the electron drift velocity to the electron thermal velocity (V/sub d//V/sub th/ ~ j/n/sub e/T/sub e//sup 1/2/), also known as the drift parameter (streaming parameter), and j/n/sub e/ (~ V/sub d/) have been measured locally at the magnetic axis in CTX spheromaks at Los Alamos. The drift parameter and j/n/sub e/ appear to be correlated with local measurements of the resistivity anomaly (eta/eta/sub Spitz/) at the magnetic axis. The drift parameter and j/n/sub e/ are varied by changing the background fill pressure. Data is presented for three cases: high density (6-mT fill), medium density (4mT fill) and low density (0mT fill).

17451 (LA—10830-C, pp 54-58) **Generalized helicity and its time derivative.** Jarboe, T.R.; Marklin, G.J. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Spheromaks can be sustained against resistive decay by helicity injection because they tend to obey the minimum energy principle. This principle states that a plasma-laden magnetic configuration will relax to a state of minimum energy subject to the constraint that the magnetic helicity is conserved. Use of helicity as a constraint on the minimization of energy was first proposed by Woltjer in connection with astrophysical phenomena. Use of the helicity constraint was first applied to the spheromak by Wells and Norwood. The principle was later applied to the reversed-field pinch (RFP) by Taylor, who was most responsible for the eventual acceptance and recognition of the principle as being important for RFP-type confinement devices. Of course, helicity does decay on the resistive diffusion time. However, if helicity is created and made to flow continuously into a confinement geometry, these additional linked fluxes can relax and sustain the configuration indefinitely against the resistive decay. In this paper an extension of the definition of helicity to include systems where B can penetrate the boundary and the penetration can be varying in time is presented. The sustainment of RFPs and spheromaks in terms of helicity injection is discussed.

17452 (LA—10830-C, pp 59-62) **Energy efficiency of the CTX magnetized coaxial plasma source.** Fernandez, J.C.; Barnes, C.W.; Jarboe, T.R.; Knox, S.O.; Platts, D.A.; McKenna, K.F. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The energy efficiency of the CTX coaxial plasma source in creating spheromaks is determined experimentally to be in agreement with the theoretical prediction of λ/sub sp//λ/sub g/, where Del x B = λ/sub sp/ B in the spheromak, and λ/sub g/ identical with μ_0I/sub g//phi/sub g/ with I/sub g/ the source current and phi/sub g/ the magnetic flux through either source electrode. This is shown to be equivalent to magnetic helicity conservation. The spheromak impurity radiation was measured using an absolutely calibrated single chord bolometer system. The theoretical efficiency is within the experimental uncertainty of the ratio of spheromak radiated energy to source input energy in a group of dirty discharges. But the radiation measurement uncertainty is too large to determine whether a substantial part of the excess source energy not used in the production of spheromak magnetic energy is radiated from the spheromak volume.

17453 (LA—10830-C, pp 63-67) **Recent helicity source and power supply improvements to CTX.** Henins, I.; Knox, S.O.; Jarboe, T.R.; Barnes, C.W. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Since the last CT Symposium, two major changes in CTX have been the introduction of pulse forming networks (PFNs) to drive the coaxial electrode helicity source, and the very recent installation of a larger source with electrode diameters about twice of the previous ones. The power supplies used for CTX have ranged from the simple connection of the capacitor bank across the electrode collector plates (slow mode) to the more sophisticated PFNs, described here, which optimize the energy transfer from the capacitor bank to the magnetic fields of the spheromak. With the PFNs the formation and sustainment phase (time to peak toroidal plasma current) lasts longer (similarly ordered 0.7 ms) than in the slow mode (similarly ordered 0.05 ms), thus lowering the peak current that must flow through the electrode surfaces. Also, by supplying the source electrodes with both a square pulse current waveform

and a quasi-steady source flux, phi/sub g/, helicity is generated at a constant source λ/sub g/ parameter.

17454 (LA—10830-C, pp 68-72) **Introduction to the m = 1 helicity source.** Platts, D.A.; Jarboe, T.R.; Wright, B.L. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The m = 1 Helicity Source, formerly called the Kinked Z-pinch, was developed as part of the Electrode Studies program at Los Alamos. The Electrode Studies program was initiated to study the control of electrode erosion in long discharge duration spheromak sources. Erosion control is necessary to reduce plasma impurities and to obtain adequate electrode lifetimes. The first task of the Electrode Studies program is to determine, from among a variety of configurations including the coaxial one, a helicity source geometry with good prospects for erosion control. The more efficient the helicity source the easier it will be to control erosion, but the source must also be easy to diagnose and modify if it is to be a useful test bed. The various erosion control techniques which have been proposed will require extensive experimentation to evaluate and optimize. Proposed techniques include, using refractory metals, profiling of the electrodes and magnetic fields, and various gas injection schemes including porous electrodes. It is considered necessary to do these experiments on an optimized helicity source so that the electrode geometries and plasma properties will be relevant. Therefore the present Electrode Studies program is aimed at developing an improved helicity source design.

17455 (LA—10830-C, pp 73-77) **Operation of the m = 1 helicity source.** Wright, B.L.; Jarboe, T.R.; Platts, D.A. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The initial phase of operation of the m = 1 helicity source has been in an asymmetric mode with only a single energized electrode (the second electrode port being fitted with a window). As described in the companion paper, the new source readily forms spheromak plasmas that are equivalent in their parameters to those achieved previously with a coaxial source in the same facility. In this paper they describe the behavior of currents and fields in the m = 1 source and examine the extent to which the basic design principles outlined above apply to its actual operation.

17456 (LA—10830-C, pp 78-81) **Equilibrium of the kink source experiment.** Marklin, G. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The kink source experiment (KSX) was conceived of as a method of injecting helicity into a spheromak making special use of the m = 1 helical Taylor state. It has a Z pinch as a helicity generating source, connected to a flux conserver through an entrance region. Since the entrance region is a long (length > diameter) cylinder, the magnetic field should be close to the helical Taylor state, which is the minimum energy configuration of a magnetized plasma in an infinite cylinder with no net flux. This paper will be concerned with modeling the actual fields in the entrance region of the KSX using zero-beta ideal MHD equilibrium theory.

17457 (LA—10830-C, pp 82-85) **Observation of Doppler shifts and applied magnetic disturbances in PS-3.5.** Antoniades, J.; Peyser, T.; Shaw, R.S.; Chin-Fatt, C.; Goldenbaum, G.C.; Hess, R.A. (Univ. of Maryland, College Park). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Side-on measurements of Doppler shifts of CIII impurity lines have been performed on the PS-3.5 spheromak to determine the spatial and temporal dependence of the ion temperature and flow velocity. Launched magnetic disturbances have been studied in an effort to understand the MHD wave properties of the spheromak.

17458 (LA—10830-C, pp 86-89) **Critical field index for passive coil stabilization of the shift instability.** Goldenbaum, G.C.; Hess, R.A.; Shaw, R.S. (Univ. of Maryland, College Park). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Criteria for the design of stabilization coils for spheromak current distributions are derived. For realistic coils and spherical, force-free plasmas a critical field index is derived above which the coils are ineffective.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Several methods for driving current in RFP's, tokamaks, and spheromaks by means of helicity injection have been recently proposed. Essential to these ideas is that it is sufficient to replace the helicity that decays due to resistive diffusion, and that the plasma has flux conversion mechanisms, presumably involving 3-D MHD activity, that cause it to relax to a preferred state, conserving the helicity injected. Such a flux conversion or dynamo mechanism has been shown to exist in RFP's, and there is good evidence that it exists in spheromaks. There is also the possibility that tokamaks have such a mechanism; the anomalous skin current penetration has long been linked to double tearing modes. In this paper a few issues regarding the plasma response to these helicity injection schemes are examined. First, it is clear that finite plasma resistivity, at least near the electrodes or gaps, plays an important role; with infinite conductivity the plasma would short out the voltages and preserve its helicity, making injection impossible. Second, flux conversions must occur. For inductively driven systems this is clear because in the absence of relaxations the helicity present after each sinusoidal cycle can only be diminished due to resistive decay. For electrode driven systems such as CTX and MS the helicity injected influences directly only the toroidal field, and generation of poloidal flux must occur via flux conversions. Two important issues are the scaling of current drive efficiency with plasma resistivity, especially near the electrodes or gaps, and the sensitivity of the schemes to the plasma's flux conversion response.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

MHD simulations of the CTX gun-injected Spheromak at Los Alamos National Laboratory are presented. The simulations have been carried out in toroidal geometry with a three-dimensional, compressible, nonlinear, resistive MHD code.

17461 (LA—10830-C, pp 98-101) **Spontaneous generation of toroidal magnetic field during spheromak formation in a conical Theta-pinch.** Milroy, R.D.; Brackbill, J.U. (Spectra Technology, Inc., Bellevue, WA). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Spheromaks have been generated in conical Theta-pinches in a similar manner to FRC generation in straight reversed-field Theta-pinches. The essential difference is that when a conical Theta-pinch coil is used, a toroidal component to the magnetic field

spontaneously appears. The poloidal component is generated by quickly reversing the current in the coil after an initial bias field is embedded in the preionized plasma. The toroidal component is generated through a much more subtle physical process. Numerical calculations have shown that the Hall term can lead to the generation of toroidal magnetic fields during the formation of an FRC; however for a straight coil, symmetry demands equal and opposite fields at each end, so no net toroidal flux or helicity can be generated. A simple analysis shows that even for a conical coil, the Hall term by itself cannot generate significant toroidal magnetic flux or helicity. They will show that a combination of the Hall term with the plasma resistivity can result in toroidal fields of comparable magnitude to experimental observation.

17462 (LA—10830-C, pp 102-105) **Compact torus compression of microwaves.** Hewett, D.W.; Langdon, A.B. (Lawrence Livermore National Lab., CA). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—). Contract W-7405-ENG-48.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The possibility that a compact torus (CT) might be accelerated to large velocities has been suggested by Hartman and Hammer. If this is feasible one application of these moving CTs might be to compress microwaves. The proposed mechanism, discussed in detail elsewhere, is that a coaxial vacuum region in front of a CT is prefilled with a number of normal electromagnetic modes on which the CT impinges. A crucial assumption of this proposal is that the CT excludes the microwaves and therefore compresses them. Should the microwaves penetrate the CT, compression efficiency is diminished and significant CT heating results. MFE applications in the same parameters regime have found electromagnetic radiation capable of penetrating, heating, and driving currents. A cursory investigation of rf penetration using a 1-D version of a direct implicity PIC code has been made. The study used a much simplified model which takes into account the relevant field orientations but allows gradients only in one spacial direction (axial). Based on a homogeneous linear model, the rf energy might not penetrate if the external omega were larger than the omega/sub 1h/ in the interior. Simulations verify this conjecture. For large amplitudes the leading edge of the CT is significantly eroded. The conclusion is that the CT may be able to compress TE modes if the initial CT peak density initially gives rise to an omega/sub 1h/ < omega - the initial TE mode frequency. These may be strongly dependent on K.B = 0 - a condition that is probably not satisfied in more realistic multidimensional geometries.

17463 (LA—10830-C, pp 106-110) **Experimental and numerical study of various methods of programmed formation on TRX-2.** Slough, J.T.; Milroy, R.D.; Harding, D.G.; Hoffman, A.L. (Spectra Technology, Inc., Bellevue, WA). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

It has long been observed that a large fraction of the poloidal flux can be lost from the FRC during the early stages of formation. Following the lead of the Russian experiments at the Kurchatov Institute, various control magnets placed at the ends of the usual theta pinch coil have been used successfully to control much of the formation dynamics and allow for the formation of FRC's with substantially higher levels of poloidal flux. The initial experiments using programmed formation were conducted on TRX-1 and have been continued on TRX-2. The most important aspect of programmed formation is the elimination of the tearing instability that is required in the usual methods of formation. The prepositioning of the separatrix in the preionized plasma at the ends of the theta pinch coil is accomplished by having the plug coil at the end of the magnet assembly produce a field in the direction opposite that of the bias field. It can be seen that as the main field is reversed, an FRC is formed simultaneously with field reversal. Axial magnetic symmetry is maintained since it is programmed by the external coils. This high degree of symmetry allows for the toleration in the subsequent formation of large dynamical axial concentrations that were once believed to be the limiting mechanism in the retention of larger amounts of poloidal flux. Quasi-steady plug coils acting alone are sufficient to avoid an asymmetric tearing reconnection. It was found that the use of another control coil, the trigger coil, located between the main theta pinch coil and the plug coil allowed for an even greater measure of control over the formation dynamics.

17464 (LA—10830-C, pp 111-115) **Design considerations for a large anti s FRC facility.** Hoffman, A.L.; Crawford, E.A.; Milroy, R.D.; Slough, J.T.; Steinhauer, L.C. (Spectra Technology, Inc., Bellevue, WA). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The number of internal gyroradii between the field null and the separatrix of field-reversed-configurations (FRC), has been identified as a key parameter governing both stability and transport. Present experiments have anti s in the range of 2, while values of about 30 are thought to be necessary in a reactor. It is thus desirable to conduct experiments in some intermediate range. A value of 10 has been chosen as a reasonable goal for a next experiment. In this paper some of the design considerations and cost optimization procedures used to pick a point design for an anti s = 10 facility are discussed.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Field reversal is a particularly important phase of field-reversed configuration (FRC) formation because it determines the trapped magnetic flux at liftoff and the average internal magnetic field associated there with (the liftoff field). The plasma heating intrinsic to the FRC formation depends strongly on B/sub LO/ as does the strength of the axial contraction dynamics. Finally, since the plasma is in contact with the wall during field reversal, phenomena during this phase determine the wall heating and the consequent desorption of impurities. A theory of the field-reversal phase is needed which explains the various phenomena in a more transparent and possibly analytical manner. The present paper describes a simple quasianalytic model that is reasonably true to experiment and detailed computations, and can be characterized in terms of simple parameters. The approach is to develop a quasisteady MHD description of the flow. The MHD model is solved which yields information about the instantaneous flow velocity toward the wall and the spatial profiles in the sheath. This then is combined with a simplified circuit model to determine the time-dependent behavior up to liftoff. A related calculation determines the wall heating.

17466 (LA—10830-C, pp 120-123) **Preliminary experimental results with the coaxial slow source.** Pietrzyk, Z.A. (Univ. of Washington, Seattle). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

A Coaxial Slow Source was constructed to generate a Field Reversed configuration (FRC) on a slow (slower than Alfve'n transit time) time scale. The machine consists of a regular FRC configuration, with an additional Theta coil in the center supplying reversed flux from the inside of this inner coil. With this source successful generation of field reversal configuration has been achieved over a wide range of parameters. Termination occurs either by inner wall contact, arising from decay of inner coil current coupled with high resistivity, due to impurities, or by some form of MHD instabilities. Near term plans include modification of inner coil circuit, and improved impurity control measures.

17467 (LA—10830-C, pp 124-127) **Quasistatic modelling of the coaxial slow source.** Hahn, K.D.; Pietrzyk, Z.A.; Vlases, G.C. (Univ. of Washington, Seattle). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

A new 1-D Lagrangian MHD numerical code in flux coordinates has been developed for the Coaxial Slow Source (CSS) geometry. It utilizes the quasistatic approximation so that the plasma evolves as a succession of equilibria. The P=P (psi) equilibrium constraint, along with the assumption of infinitely fast axial temperature relaxation on closed field lines, is incorporated. An axially elongated, rectangular plasma is assumed. The axial length is adjusted by the global average $<\beta>$ condition, or assumed to be fixed. In this paper predictions obtained with the code, and a limited amount of comparison with experimental data are presented.

17468 (LA—10830-C, pp 128-131) **FRC plasma transport studies with 1-D plus modified Hill's vortex radial profiles.** Shieh, D.R.; York, T.M. (Pennsylvania State Univ., University Park). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

A time dependent one-dimensional-plus (z-direction plus defined radial profiles) fluid model which includes plasma both inside and outside the separatrix (two regions) has been developed. The 1-D computer model has been used with success to model the FRX-B experiment. From the comparisons of eight different cases, it is concluded that: (1) radial gradient length expands very slowly (C/sub d/ = 0.25) or keeps the same in time, rather than expands fast (C/sub d/ = 1) or shrinks (T.F.L.), (2) particle and T/sub e/ radical loss is dominated by the LHD anomalous transport theory, (3) axial heat conduction is dominated by cross field rather than along field conduction, (4) with eta/sub phi/ = 4.05 eta/sub cl/, the poloidal flux diffusion time, tau/sub phi/, is 48 μsec for case A. For plasma outside, sidewall interaction and added guide coil affect the plasma behavior locally; however, the upstream influence on the plasma inside is very small.

17469 (LA—10830-C, pp 132-136) **Recent FRC translation experiments on FRX-C/T.** Rej, D.J.; Armstrong, W.T.; Chrien, R.E.; Hugrass, W.N.; Klingner, P.L.; McKenna, K.F.; Sherwood, E.G.; Siemon, R.E.; Tuszewski, M. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Since the last CT Symposium, several accomplishments have been realized from the FRC translation studies on the FRX-C/T device: (1) FRCs have been launched into, and trapped in, a dc magnetic guide field region without the use of any pulsed gate coils; (2) detailed studies of translation dynamics have been performed which are consistent with energy conservation, adiabatic compression theory, and 2-D MHD simulations; (3) the confinement properties of translated FRC has been evaluated; (4) translation through either puff or static deuterium gas fill has been demonstrated; (5) higher density ($n \leqq 4 \times 10^{15}$ cm^{-3}) FRCs have been translated over 10-m lengths; (6) the n = 2 rotational instability has been stabilized by FRC translation into a weak helical quadrupole field.

17470 (LA—10830-C, pp 137-141) **FRC formation studies on FRX-C with Z-discharge ionization.** Armstrong, W.T.; Chrien, R.E.; Hugrass, W.; Klingner, P.L.; McKenna, K.F.; Milroy, R.D.; Rej, D.J.; Sherwood, E.G.; Siemon, R.E.; Tuszewski, M. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Recent operation at high-bias levels on FRX-C is discussed in this paper. The motivation of these in situ formation studies was to explore the use of Z-discharge pre-ionization (Z-PI) for achieving larger trapped poloidal flux and commensurately large x/sub s/ values, where x/sub s/ is the ratio of the separatrix radius r/sub s/ to the coil radius r/sub c/. Such studies are of interest in testing predicted improvements of particle confinement and degradation of stability with the associated increase of anti s, the approximate number of ion gyroradii across the minor radius of the FRC. The results of these studies may be summarized briefly as: (1) the Z-PI worked well in conjunction with conventional theta-PI to extend the level of trapped flux at high fill pressure (20 mtorr), but the Z-PI worked poorly at low fill pressure (5 mtorr), and (2) increased trapped flux at 5 mtorr quickly led to degradation of the flux lifetime and no significant increase in x/sub s/, while at 20 mtorr the initial value of x/sub s was increased significantly but with degraded flux lifetimes. These studies indicate that increased closed flux thru changes in PI techniques is insufficient by itself to form long-lived, large-radius FRCs in the present FRX-C configuration.

17471 (LA—10830-C, pp 142-146) **Axial dynamics in field-reversed theta-pinches.** Tuszewski, M. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

This paper is concerned with the final phase during formation of field-reversed configurations (FRC): the axial dynamics. Strictly speaking, this study only applies to field-reversed theta-pinches for which spontaneous reconnection occurs. In early FRC work on such devices, a rapid disappearance of the trapped flux associated with axial contraction was already noted. At Los Alamos, axial dynamics was sometimes observed on FRX-A, virtually never noticed on FRX-B[3] even with bias fields B/sub b/ > 3 kG, but found recently to seriously limit the flux trapping in FRX-C. Poor FRC confinement was consistently found in that device whenever B/sub b/ exceeded a certain value B/sub bM/ of about 0.8 kG and 1.6 kG for 5 and 20 mtorr cases, respectively. This phenomenon remained unexplained as FRC confinement and translation studies were undertaken with B/sub b/ $\leqq$ B/sub bM/. In the context of a preliminary FRX-D study, Steinhauer's formation model was used. When applied to the existing FRX-C data, this model indicated a rather sudden transition from weak to strong axial shocks for B/sub b/ ~ B/sub bM/, which suggested that axial dynamics might be responsible for the poor FRC confinement observed for B/sub b/ $\geqq$ B/sub bM/. This was recently confirmed by in situ experiments on FRX-C/T. These data are reported and discussed here.

17472 (LA—10830-C, pp 147-151) **FRC translation into a compression coil.** Chrien, R.E. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The equilibrium and translational kinematics of Field-Reversed Configurations (FRCs) in a cylindrical coil which does not conserve flux are problems that arise in connection with adiabatic compressional heating. In this paper, they consider several features of the problem of FRC translation into a compression coil. First, the magnitude of the guide field is calculated and found to exceed that which would be applied to a flux conserver. Second, energy conservation is applied to FRC translation from a flux conserver into a compression coil. It is found that a significant temperature decrease is required for translation to be energetically possible. The temperature change depends on the external inductance in the compression circuit. An analogous case is that of a compression region composed of a compound magnet; in this case the temperature change depends on the ratio of inner and outer coil radii. Finally, the kinematics of intermediate translation states are calculated using an abrupt transition model. It is found, in this model, that the FRC must overcome a potential hill during translation, which requires a small initial velocity.

17473 (LA—10830-C, pp 152-154) **FRX-C/T large source modification.** Tuszewski, M.; Chrien, R.E.; Yavornik, E.J.; Armstrong, W.T.; Hugrass, W.; Linford, R.K.; McKenna, K.F.; Rej, D.J.; Siemon, R.E. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

FRC experiments on FRX-C/T during the past two years have been devoted to translation studies and, more recently, to formation studies in situ. The interest in the latter became stronger as FRX-D was proposed. It is intended that, in summer 1985, FRX-C/T be modified with a larger coil that would be essentially a half-scale prototype of FRX-D. This would allow studies of flux trapping with increased size and with the associated enhanced axial dynamics. The results from these formation studies, with and without some improved formation techniques, may influence the design of the FRX-D source in a major way. In addition, this FRX-C/T Large Source Modification may allow the study of FRC's with somewhat increased values of anti s, in the range 2-3. This may be sufficient to reach a new stability regime where the predicted internal tilt mode may occur. Finally, the larger coil size should yield improved FRC confinement times by about 50%, and may allow with a minimum of plasma decompression the study of FRC's with x/sub s/ in the range 0.6-0.7 in possible future translation experiments.

17474 (LA—10830-C, pp 155-158) **Proposed FRX-D experiment.** McKenna, K.F.; Armstrong, W.T.; Chrien, R.E.; Hugrass, W.N.; Linford, R.K.; Rej, D.J.; Schwarzmeier, J.L.; Siemon, R.E.; Tuszewski, M. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The field-reversed-configuration (FRC) research program is poised for a significant step forward. Resolution of the critical FRC physics issues, which must now be addressed in order to advance the development of this concept, requires experimental studies in a plasma regime closer to reactor relevance than is possible with existing devices. The purpose of FRX-D is to extrapolate the parameters of FRC's into the required regime of large plasma size relative to an ion gyroradius i.e., large anti s. The critical issues that FRX-D will address are: (1) the FRC stability and confinement properties at large anti s; (2) the demonstration of adiabatic compression as an efficient, technologically attractive FRC heating method; (3) the identification of the dominant electron energy-loss mechanism, and; (4) the determination of the dependence of poloidal flux loss on electron temperature. An additional, more technologically oriented purpose of FRX-D is to demonstrate the separation of FRC formation and heating functions using the reactor-like technique of sequential formation/translation/compression.

17475 (LA—10830-C, pp 159-163) **Recent results of an internal tilt mode calculation in FRCs.** Barnes, D.C.; Schwarzmeier, J.L.; Lewis, H.R. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Recent theoretical results on the stability of FRCs to the internal tilt mode are presented. An approximate treatment of collisions shows that collisions have a small effect on the growth rate of the mode until the plasma becomes very collisional (λ/sub ii/ ≦ r/sub s//2). Finite Larmor radius theory predicts that the growth rate of the instability normalized to that of MHD depends only on the combination anti s/e, where e is the plasma elongation. However, a full Vlasov stability calculation does not appear to show such a scaling.

17476 (LA—10830-C, pp 164-167) **Plasma resistivity near null magnetic field region in FRC.** Hamasaki, S.; Krall, N.A.; Sperling, J.L. (JAYCOR, San Diego, CA). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

One persistent mystery during the stable confinement period in FRC experiments is the rate of magnetic flux loss. The particle confinement time is consistent with theoretical modelings based on the lower-hybrid-drift instability, but the flux decay is much faster than the theoretical predictions. Flux decay is proportional to the resistivity at the plasma center, where the lower-hybrid-drift mode is predicted to be stable, and classical resistivity is too small to explain the magnetic flux confinement time. In this paper they consider several processes which affect flux decay.

17477 (LA—10830-C, pp 168-171) **Transport simulation of a field-reversed configuration plasma.** Shumaker, D.E. Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—). Contract W-7405-ENG-48.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

This paper presents a comparison of a 1 1/2-D transport simulation of a FRC, field-reversed configuration, with experimental results. The plasma consist of two regions one which has open field lines and the other which has closed field lines. The simulation code computes the evolution of the plasma by alternating between the solution of a 2-D equilibrium and the simultaneous solution of three 1-D transport equations. The plasma is modeled as evolving through a sequence of axisymmetric equilibria. A property of these equilibria is that some quantities are 1-D function of the flux surface label. This makes it possible to obtain 1-D transport equations for these flux surface quantities. The transport equations advance the particle count, electron entropy and ion entropy. These are adisbatic quantities. They are used because there transport equations are independent of the flux surface velocity. This reduces the coupling between the equilibrium calculation and the transport calculation. This paper presents a comparison of the various confinement times obtained from the simulation with the experimentally measured values. There are three confinement times which are compared; particle confinement time, tau/sub N/, energy confinement time, tau/sub E/, and poloidal magnetic flux confinement time, tau/sub phi/. These confinement times are compared to confinement time for the FRX-C experiment at Los Alamos.

17478 (LA—10830-C, pp 172-175) **Mode beating model of ac helicity injection.** Bellan, P.M. (California Institute of Technology, Pasadena). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Ac helicity injection (F-Theta pumping) was previously proposed to consist of two stages: (1) quasi-classical stage where the velocity perturbation of a compressional A lfven mode and the magnetic field perturbation of a resistive diffusion mode beat to provide a dc surface current and (2) an anomalous stage where this dc current penetrates to the plasma core via tearing or magnetic turbulence. This paper will discuss some additional features of ac helicity injection using these concepts.

17479 (LA—10830-C, pp 176-178) **Generalization of the Taylor Principle.** Jensen, T.H. (GA Technologies Inc., San Diego, CA). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

The usual Taylor Principle can in general only be applied when the system is closed. This paper describes a suggestion of a generalization to cover the case that the plasma is surrounded by a conducting shell with narrow gaps where the external circuits connected to the gaps consist of just inductors. The suggested constraint of the generalized Taylor Principle is that no helicity is absorbed by the plasma. The usual assumption that the stable Taylor Equilibrium is that for which the magnetic energy in the plasma region as well as in the external inductors is minimized subject to the above constraint, again leads to a unique configuration. It is

found that this configuration is dependent upon the inductances of the external inductors. For the sake of conceptual simplicity, consider a closed shell of conducting material. The interior of the shell may be divided into various compartments only corrected through narrow gaps in the conducting walls between these compartments. They assume plasma present in only one of the compartments; the neighboring compartments represent the external inductors connected across the gaps of the plasma compartment.

17480 (LA—10830-C, pp 187-190) **Ion ring experiments with applications to the compact toroid program.** Schamiloglu, E.; Greenly, J.B.; Hammer, D.A.; Pedrow, P.D.; Sudan, R.N. (Cornell Univ., Ithaca, NY). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—). Contract AC02-77ET53005.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

There has been considerable progress recently in the Cornell ion ring experimental program towards developing the technology and understanding for injecting large orbit energetic ions into a compact toroid plasma. The merits of such a CT-Hybrid have been discussed elsewhere, but it is worthwhile to emphasize that energetic ions serve to (i) heat the CT plasma and (ii) provide stabilization against several disruptive macroscopic modes. The two experiments in progress are IREX and LONGSHOT II. The IREX experiment is studying trapped, weakly diamagnetic proton rings in a magnetic mirror field. The goal of the IREX experiment is to trap and magnetically compress strong proton rings. The LONGSHOT II experiment is studying the propagation of weakly diamagnetic proton rings in a preionized hydrogen plasma. In addition, the LONGSHOT II injector is being used for the development of kilojoule pulsed proton sources capable of repetitive pulse operation. The goal of the LONGSHOT II experiment is to merge a proton ring with a CT plasma.

17481 (LA—10830-C, pp 191-195) **Injection and trapping of intense neutralized ion beams in closed magnetic configuration.** Katzenstein, J.; Li, R.; Rostoker, N. (Univ. of California, Irvine). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—).

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

It has been demonstrated by calculation and verified by experiment that a neutralized ion beam may be injected across magnetic field lines, that the beam will penetrate a plasma confined by the field and be trapped. The combined processes of injection, penetration, and confinement of the beam requires the satisfaction of three conditions outlined here. In this paper the question of single particle confinement of the beam is addressed with particular reference to UCI Tokamak and text.

17482 (LA—10830-C, pp 196-199) **Acceleration of compact torus plasma rings in a coaxial rail-gun.** Hartman, C.W.; Hammer, J.H.; Eddleman, J. (Lawrence Livermore National Lab., CA). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—). Contract W-7405-ENG-48.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

They discuss here theoretical studies of magnetic acceleration of Compact Torus plasma rings in a coaxial, rail-gun accelerator. The rings are formed using a magnetized coaxial plasma gun and are accelerated by injection of B/sub Theta/ flux from an accelerator bank. After acceleration, the rings enter a focusing cone where the ring is decelerated and reduced in radius. As the ring radius decreases, the ring magnetic energy increases until it equals the entering kinetic energy and the ring stagnates. Scaling laws and numerical calculations of acceleration using a O-D numerical code are presented. 2-D, MHD simulations are shown which demonstrate ring formation, acceleration, and focusing. Finally, 3-D calculations are discussed which determine the ideal MHD stability of the accelerated ring.

17483 (LA—10830-C, pp 200-203) **Energy confinement in a high-current reversed field pinch.** An, Z.G.; Lee, G.S.; Diamond, P.H. (Univ. of Texas, Austin). Sep 1986. NTIS, PC A10/MF A01. File Number DE87003801. (CONF-8505100—). Contract FG05-80ET53088.

From 7. symposium on the physics and technology of compact toroids in the magnetic fusion energy program; Santa Fe, NM, USA (21 May 1985).

Ion temperature gradients drive instabilities which are strong candidates for the cause of confinement degradation in high current RFP's. This paper investigates coupled resistive interchange-ion temperature gradient modes via a model based on two-fluid theory. Results show that ion modes can be a major channel for thermal losses and suggest that pellet injection is a potentially viable mechanism for improving energy confinement.

17484 (LA-UR—86-3705) **Requirements for charged-particle reaction cross sections in the d-d, d-t, t-t, and d-^{3}He fuel cycles.** Jarmie, N. (Los Alamos National Lab., NM (USA)). Dec 1986. Contract W-7405-ENG-36. 14p. (CONF-861250—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87002929.

From IAEA advisory group meeting on nuclear data for fusion reactor technology; Dresden, German D.R. (1 Dec 1986).

This paper reviews the status of experimental data and data evaluations for charged-particle reactions of interest in fusion-reactor design. In particular, the ^{3}H(t,α)n, ^{2}H(d,p)^{3}H, ^{2}H(d,^{3}He)n, ^{3}H(t,α)nn and ^{3}He(d,p)^{4}He reactions at low energies are studied. Other secondary reactions are considered. The conclusion is that such cross sections are well known for the near and medium term, and that no crucial experimental lack exists. There is a serious lack of standard evaluations of these reactions, which should be in an internationally acceptable format and easily accessible. Support for generating such evaluations should be given serious consideration.

17485 (NIIEFA-P-K—0687) **High-voltage cable lead-in for pulse techniques.** Arsent'ev, V.N.; Vasilevskij, M.A.; Grad, G.A.; Finkel'shtejn, K.I. (Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike, Moscow (USSR)). 1985. 11p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700846.

Problems of projection of high-voltage cable lead-ins used in particular in electroionization lasers with separately standing pulsed supply source are considered in the paper. It is shown that uniform voltage division along lead-in surface can be provided by means of electrolyte filling gaps between cable termination and bushing insulator. Results of voltage distribution calculation along lead-in surface depending on electrolyte column resistance and voltage pulse duration are given. It is noted that use of cable lead-ins with ohmic voltage divider decreases overvoltage level appearing during impedance mismatch of pulse voltage generator and discharge gap resistance. 6 refs.; 7 figs.

17486 (ORNL/FEDC—85/10) **Liquid nitrogen cooling considerations of the Compact Ignition Tokamak.** Dabiri, A.E. (Oak Ridge National Lab., TN (USA)). Oct 1986. Contract AC05-84OR21400. 41p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005278.

A simple model was developed to estimate the cooldown time between pulses of toroidal field (TF) coils of the Compact Ignition Tokamak (CIT) using liquid nitrogen. Good agreement was obtained between the analysis results and those measured in the early fusion experimental devices. A cooldown time of about 1 h would reduce the TF coil temperature to about 80 K. An R and D experimental program is required to determine the actual cooldown time between pulses, an issue in the conceptual design of the CIT.

17487 (SAND—86-1382C) **Intense lithium ion beam diagnostic using the inverse nuclear reactor D(^{7}Li,n)^{8}Be.** Leeper, R.J.; Kim, K.H.; Hebron, D.E.; Wing, N.D.; Norbeck, E. (Sandia National Labs., Albuquerque, NM (USA); Iowa Univ., Iowa City (USA)). Nov 1986. Contract AC04-76DP00789. 11p. (CONF-861114—38). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004521.

From 9. international conference on application of accelerators in research and industry; Denton, TX, USA (10 Nov 1986).

The decision to employ high voltage lithium ion beams on the 100 TW PBFA-II accelerator has prompted the investigation of using the inverse nuclear reaction $D(^7Li,n)^8Be$ as an intense beam diagnostic. The diagnostic scheme operates by utilizing the high energy neutrons that are emitted from the $D(^7Li,n)^8Be$ reaction when a ^7Li beam is incident upon a target containing deuterons. These high energy neutrons can in turn induce the $^{63}Cu(n,2n)^{62}Cu(\beta^+)$ reaction. The amount of 9.74 min ^{62}Cu activity formed can then be measured and related to the total number of ^7Li in the beam. The results of calibration runs using ^7Li beams accelerated to energies from 1 to 32 MeV are summarized.

17488 **(UCRL—52000-86-11) Energy and Technology Review, November 1986.** Cabayan, H.S.; Kozman, T.A.; Clements, W.; de Vore, L.; Gerich, C.; Hendry, D.P.; O'Neal, E.M. (eds.). (Lawrence Livermore National Lab., CA (USA)). Nov 1986. Contract W-7405-ENG-48. 71p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005196.

An interview with Ken Fowler, LLNL's Associate Director for Magnetic Fusion Energy, is presented. Dr. Fowler describes the present state of fusion research at LLNL and comments on future directions for the program. Also included are the following: (1) evolution of the tandem-mirror approach to magnetic fusion, (2) MFTF-B, (3) overview of plant and equipment tests, (4) PACE tests: the magnet system, (5) PACE tests: the cryogenic system, (6) PACE tests: the neutral beam heating system, (7) PACE tests: the ecr heating system, (8) PACE tests: the plasma diagnostics system, and (9) PACE tests: the integrated control system. (MOW)

17489 **(UCRL—95588) The operator interface for the Mirror Fusion Test Facility.** Lang, N.C. (Lawrence Livermore National Lab., CA (USA)). Dec 1986. Contract W-7405-ENG-48. 35p. (CONF-861244—1). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87002755.

From ACM SIGCHI workshop on mixed modes of interaction; Key West, FL, USA (15 Dec 1986).

The uncertain and most likely changing nature of a large experimental facility like MFTF, as well as its large number of control and monitor points, ruled against the traditional hardware approach involving walls of knobs, dials, oscilloscopes, and strip chart recorders. Rather, from the beginning, project management specified computer control of all systems, and operation of the complete MFTF under an integrated computer control system became a major engineering goal. The Integrated Controls and Diagnostics (ICADS) group was charged with the design and implementation of this control system. We designed a control system with an extremely flexible operator interface which uses computer generated CRT displays for output and pointing devices such as touch sensitive CRT overlays, mice, and joysticks for input. Construction of MFTF was completed at the end of 1985 within the project budget of $241.6M and was followed immediately by a 5 month long acceptance test. During this period (known as PACE test) operators, engineers, and physicists successfully used our computer control system daily to test MFTF. Much of their willingness to forsake the traditional hands-on hardware approach to testing was a result of the powerful and flexible operator interface to the MFTF control system. In this paper, we describe the operator interface with emphasis on the displays, the touch screens, and the mouse. We also report the experiences of users and, in particular, stress those aspects of the user interface they strongly liked and disliked.

17490 **(UTNL-R—0176) Proceedings of study meeting on nuclear fission-nuclear fusion hybrid reactors.** (Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab.). May 1985. 43p. (In Japanese). (CONF-8501104—Summs.). NTIS (US Sales Only), PC A03/MF A01. File Number DE87701240.

From Study meeting on nuclear fission-nuclear fusion hybrid reactor; Tokai, Ibaraki, Japan (11 Jan 1985).

This study meeting was held on January 11, 1985, at the Nuclear Engineering Research Laboratory, University of Tokyo. Lectures were carried out on the outline of hybrid reactors and the one-dimensional transport burning computation code BISON, the neutronics experiment using depleted uranium blocks, the safety of hybrid reactors, electric power-producing hybrid reactors and their safety analysis (balanced concentration type blankets, the dynamic characteristics of DT tokamak hybrid reactors, fuel production type hybrid reactors) UO/sub 2/ powder direct enrichment type, and the development of nuclear fusion reactors and the significance of hybrid reactors. The summaries of these lectures are collected in this report. (Kako, I.).

17491 **Multishell inertial confinement fusion target.** Holland, J.R.; Del Vecchio, R.M. (to Dept. of Energy, Washington, DC). US Patent 4,634,567. 6 Jan 1987. Filed date 10 Aug 1983. vp.

This patent describes a multishell inertial confinement fusion target, comprising: a preformed fuel pellet; a hollow shell surrounding the fuel pellet and having an inner surface spaced from an outer surface of the fuel pellet, the shell comprising an inner layer of self-supporting material and an outer coating; and a pair of substantially parallel taut open nets stretched across the shell and secured to the inner layer of the shell at a number of spaced locations around the inner surface thereof and along a plane cutting the shell parallel to an equator of the shell and spaced therefrom. The pair of taut open nets are in spaced relationship with respect to one another and with respect to the equator of the shell and located on opposite sides of the equator. The pair of taut open nets form an open center pocket therebetween for engaging opposing portions of the outer surface of the fuel pellet to maintain the fuel pellet in a substantially concentric position relative to the inner surface of the shell; each of the taut open nets consisting of a network of intersecting fibers, each of the fibers being stretched across the shell with ends thereof being scured to the inner layer of the shell along the plane. The fibers each have a length less than a diameter across the equator of the shell so as to form the open central pocket for engaging the opposing portions of the outer surface of the fuel pellet.

17492 **Physics guidelines for the Compact Ignition Tokamak.** Sheffield, J.; Dory, R.A.; Houlberg, W.A.; Uckan, N.A.; Bell, M.; Colestock, P.; Hosea, J.; Kaye, S.; Petravic, M.; Post, D. (Oak Ridge National Lab., P.O. Box Y, Oak Ridge, TN 37831). *Fusion Technology;* **10**: No. 3, 481-490(Nov 1986). (CONF-860652—). Contract AC05-84OR21400.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The goal of the Compact Ignition Tokamak (CIT) program is to provide a cost-effective route to the production of a burning deuterium-tritium plasma, so that alpha-particle effects may be studied. A key issue to be studied in the CIT is whether alpha power behaves like other power sources in affecting tokamak plasma confinement. The program is managed by the Princeton Plasma Physics Laboratory and includes broad community involvement. Guidelines for the preliminary design effort have been provided by the Ignition Technical Oversight Committee in discussion with the tokamak community. The reference design is a tokamak with a high field (10 T), high current (10 MA), a poloidal divertor, and liquid-nitrogen-cooled coils. It is a small, high-power-density device of the type proposed by Bruno Coppi (MIT). It has a major radius of 1.23 m, a minor radius of 0.43 m, and a plasma ellipticity of 1.8. This paper reviews the aims of the program and the basis for the physics guidelines. The role of the CIT in the longer-term tokamak program is briefly discussed.

17493 **Overview of the Compact Ignition Tokamak.** Flanagan, C.A.; Brown, T.G.; Hamilton, W.R.; Lee, V.D.; Peng, Y.K.M.; Shannon, T.E.; Spampinato, P.T.; Yugo, J.J. (Fusion Engineering Design Center, P.O. Box Y, FEDC Building, Oak Ridge, TN 37831). *Fusion Technology;* **10**: No. 3, 491-497(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Compact Ignition Tokamak (CIT) mission is to achieve ignition and provide the capability to experimentally study burning plasma behavior. A national team has developed a baseline concept including definition of the necessary research and development. The baseline concept satisfies the physics performance objectives established for the project and complies with defined design specifications. To ensure that the mission is achieved, the design requires large magnetic fields on axis (— 10 T) and use of large plasma cur-

rents (— 10 MA). The design is capable of accommodating significant auxiliary heating to enter the ignited regime. The CIT is designed to operate in plasma parameter regimes that a are directly relevant to future fusion power reactors.

17494 **Configuration development and structural assessment of the FEDC Ignitor concept.** Brown, T.G.; Lee, V.D.; Mayhall, J.A. (Fusion Engineering Design Center, P.O. Box Y, Oak Ridge, TN 37831). *Fusion Technology;* **10**: No. 3, 508-513(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Fusion Engineering Design Center (FEDC) performed a design study for a compact ignition tokamak based on the design approach established by Professor Bruno Coppi of the Massachusetts Institute of Technology in his Ignitor concept. His Ignitor concept has two unique features. First, the throat of the copper plate toroidal field (TF) coils is preloaded in the vertical direction to minimize the stress levels in the copper. Second, the net inward radial TF coil forces are balanced by a combination of wedging on the adjacent faces of the TF coils and by bucking against the ohmic heating solenoid coils in the bore of the tokamak. Later Ignitor concepts eliminated the wedging reactions. Both of these features inherently reduce the radial build of the tokamak device. The FEDC version of Ignitor incorporates both of these unique features packaged in a different configurational arrangement. The FEDC Ignitor features a totally external preload system. The preload is applied directly to the inner leg of the TF coils in the vertical direction only. Horizontal rings are utilized only to react inplane TF coil forces and are not part of the preload system. Modular quadrants of TF coil encasements are utilized to vastly simplify device assembly methods. This design allows the entire core assembly to be constructed in a manufacturing facility and shipped to the site. The improved configuration also results in larger access ports direly needed for diagnostics and radio frequency heating units which may be required. This paper presents the configuration and a structural assessment of the FEDC Ignitor concept.

17495 **International Tokamak Reactor (INTOR).** Stacey, W.M. Jr. (Georgia Institute of Technology, Atlanta, GA 30332). *Fusion Technology;* **10**: No. 3, 704-708(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The current INTOR design concept and the ongoing work in the INTOR Workshop are reviewed. The ongoing work includes evaluation of innovations that could substantially improve tokamak reactors, analysis of critical technical issues that affect the feasibility of the INTOR design concept and revision of the INTOR conceptual design.

17496 **Tokamak power systems studies at ANL.** Baker, C.C.; Ehst, D.A.; Brooks, J.N.; Evans, K. Jr. (Argonne National Lab., 9700 South Cass Avenue, Bldg. 205, Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 709-718(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A number of advances in plasma physics and engineering promise to greatly improve the reactor prospects of tokamaks. The following features, in particular, are examined: (a) large aspect ratio ($A \approx 6$), which may ease maintenance; (b) high beta ($\beta \geq 0.20$) without indentation, which brings the maximum toroidal field down to about 7 T; (c) low toroidal current ($I \approx 5MA$), which reduces the cost of the current drive and equilibrium field system; and (d) steady state operation with current density control via fast and slow wave current drive. The key to high beta operation with low toroidal current lies in utilizing second stability regime equilibria with the required current distributions produced by an appropriate selection of wave driver frequencies and power spectra. The ray tracing and current drive calculation is self-consistent with the actual magnetic fields produced in the plasma. In addition to matching desirable high-beta equilibria, this method is capable of producing a large variety of new equilibria, many of which look attractive. The impurity control activities in TPSS have emphasized the self-pumping concept as applied to using the entire first wall or "slot" limiters. The blanket design effort has emphasized liquid metal and Flibe concepts. The reference concept is a liquid lithium/vanadium, self-cooled configuration. Overall, there exists a number of major design improvements which will substantially improve the attractiveness of tokamak reactors.

17497 **IPFR, Integrated Pool Fusion Reactor Concept.** Sze, D.K. (Argonne National Lab., 9700 South Cass Avenue, FPP-205, Argonne, IL 60439-4837). *Fusion Technology;* **10**: No. 3, 875-880(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The IPFR (Integrated Pool Fusion Reactor) concept involves placing a fusion reactor into a pool of molten Flibe. The Flibe serves the multiple functions of breeding, cooling, shielding, and moderating. Therefore, the only structural material between the superconducting magnets and the plasma is the first wall. The first wall is a stand-alone structure with no coolant connection and is cooled by Flibe at atmospheric pressure. There is also no need for a primary coolant loop. The design is expected to improve the safety, reliability, and maintainability aspects of the fusion system.

17498 **Applications of the Integrated-Blanket-Coil concept to the compact reversed-field pinch reactor.** Duggan, W.P.; Steiner, D.; Embrechts, M.J. (Dept. of Nuclear Engineering, Rensselaer Polytechnic Institute, Troy, NY). *Fusion Technology;* **10**: No. 3, 890-895(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A design of a compact fusion reactor is proposed based on the reversed field pinch and utilizing the "Integrated-Blanket-Coil" (IBC) concept. The IBC is applied to the toroidal field and divertor systems, with liquid metal used for cooling both the first wall and blanket. This simplifies the overall design by requiring only a single coolant cycle. In addition, safety is increased by eliminating any possible lithium-water interaction in the fusion power core. Finally, replacing conventional copper divertor coils with IBC components enhances tritium breeding and energy recovery. A generic problem with liquid metal coolants is their reduced heat transfer capabilities in magnetic fields. In this context, the use of liquid metal coolants may limit the allowable neutron wall loading to a value of 10 MW/m/sup 2/. Above this value it may be necessary to use water cooling for the first wall and divertor surfaces.

17499 **TIBER II-An upgraded tokamak ignition/burn experimental reactor.** Henning, C.D.; Logan, B.G.; Perkins, L.J.; Barr, W.L.; Bulmer, R.H.; Devoto, R.S.; Doggett, J.N.; Johnston, B.M.; Lee, J.D.; Miller, J.R. (Lawrence Livermore National Lab., Univ. of California, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 1079-1087(Nov 1986). (CONF-860652—). Contract W-7405-ENG-48.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The authors are designing a minimum-size Tokamak Ignition/Burn Reactor (TIBER II). This design incorporates physics requirements, neutron wall loading and fluence parameters that will make it compatible with a nuclear testing mission. Reactor relevant physics will be tested by using current drive and steady-state operation. Although the design accommodates several current drive options, including neutral beams, the base case uses a combination of lower hybrid and electron-cyclotron radio frequency power. Minium neutron shielding, compact structures, high magnet-current densities, and remotely maintainable vacuum seals, all contribute to the compact size.

17500 **Compact fusion engineering research facility based upon the LITE concept.** Wagner, C.E.; Berwald, D.; Listvinsky, G. (TRW, Redondo Beach, CA 90278). *Fusion Technology;* **10**: No. 3, 1117-1122(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The authors present a Fusion Engineering Research Facility Design based upon the Long Pulse Test Experiment (LITE) Concept. This design features component upgrades of the LITE design to allow long pulse, high fluence operation, and to proviae access

for engineering test ports. This facility could perform an engineering mission nearly as ambitious as INTOR at less than half the projected life-cycle operating costs.

17501 **The final version of MINIMARS--An engineering view.** Nelson, W.D.; Lousteau, D.C.; Doggett, J.N. (Fusion Engineering Design Center, P.O. Box Y, Oak Ridge, TN 37831). *Fusion Technology;* **10**: No. 3, 1146-1152(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A two year study to describe an attractive tandem mirror reactor has recently been completed. The reactor, called MINIMARS, has met all its mission goals. For instance, it will produce 600 MW of net electrical power at a cost of less than 50 mill/kWh. It has a mass utilization of 100 kW/tonne. In the event of a major accident, the MINIMARS reactor will minimize the risk of a major loss in investment and will be passively safe. The first year of the study emphasized innovative concepts and trade studies that led to good cost vs performance. The second year of the study developed the proposed concepts into an integrated point design. This paper presents a description of the MINIMARS design and its related cost. The engineering integration of this machine has been a principal activity at the Fusion Engineering Design Center (FEDC).

17502 **Advanced tokamak reactors based on the spherical torus (ATR/ST).** Miller, R.L.; Krakowski, R.A.; Bathke, C.G.; Copenhaver, C.; Schnurr, N.M.; Engelhardt, A.G.; Seed, T.J.; Zubrin, R.M. (Los Alamos National Lab., Los Alamos, NM 87544). *Fusion Technology;* **10**: No. 3, 1153-1158(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Results of a preliminary conceptual design of a magnetic fusion reactor based on the spherical torus (tokamak), characterized by high first-stability-regime beta values at low aspect ratio and moderate vertical elongation of the plasma, are described. The concept incorporates resistive (demountable) toroidal-field coils, a double-null poloidal-field magnetic divertor, and the potential for oscillating-field current drive to allow steady-state operation. The physics basis, design-point determination, and fusion-power-core engineering are summarized.

17503 **Fusion reactor options and alternatives for the RFP.** Miller, R.L.; Krakowski, R.A.; Bathke, C.G.; Werley, K.A.; Hagenson, R.L. (Los Alamos National Lab., P.O. Box 1663, MS F641, Los Alamos, NM 87544). *Fusion Technology;* **10**: No. 3, 1159-1164(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The poloidal-field-dominated confinement properties of the Reversed-Field Pinch (RFP) are exploited to examine physics and technical issues related to compact, high-power-density fusion reactors. Past studies of the Compact RFP Reactor (CRFPR) were based on a liquid-metal-cooled fusion power core (FPC) that confined high-density plasma at high beta with fields generated by resistive coils. These early framework studies combine with a better conceptual understanding of RFP confinement, impurity control, and current drive to justify further study. A comprehensive systems and trade study has been conducted as part of an ongoing in-depth reactor assessment. Optimal reactor designs, directions, and design sensitivities emerging from this study are described.

17504 **An assessment of multiplexed deployment of advanced commercial tokamaks.** Whitley, R.H.; Lutz, G.R.; Frieje, S.A.; Berwald, D.H.; Gordon, J.D. (TRW Space and Technology Group, One Space Park, Redondo Beach, CA 90278). *Fusion Technology;* **10**: No. 3, 1165-1170(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A commercial electric plant concept has been developed with multiple advanced tokamak reactors operating at a single site with shared equipment. These multiplexed reactors use superconducting magnets, operate at high beta, and have inductively driven plasma current. The attractiveness of this approach is based on cost reductions which are achieved by the sharing of some components and on availability improvements resulting from the addition of standby equipment. Parametric studies have been performed to determine both the optimal number of reactors in a plant and the optimal reactor characteristics. A plant layout has been developed which uses remote maintenance technologies for operation and maintenance such that at least part of the plant is always operational.

17505 **The fusion applications study - FAME.** Schultz, K.R.; Engholm, B.A.; Bourque, R.F.; Cheng, E.T.; Schaffer, M.J.; Wong, C.P.C. (GA Technologies Inc., San Diego, CA). *Fusion Technology;* **10**: No. 3, 1279-1289(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Fusion Applications and Market Evaluation ("FAME") study, being conducted by GA Technologies for Lawrence Livermore National Laboratory (LLNL) and US Department of Energy, Office of Fusion Energy, (US DOE) is described. This two-year program has a FY86 objective of Evaluating Alternative Applications of Fusion, and a FY87 goal of Exploring Innovative Applications. Applications are being reviewed and categorized into Baseline, Nuclear, Chemical, Electromagnetic, and Thermal application categories. The "traditional" applications of electricity generation, fissile fuel and tritium production, and hydrogen production continue to look attractive. Particularly promising new applications to date, with potential for near-term markets, are isotope production and radiation processing, especially when allied with the traditional application of electricity production. The economics of separate applications as well as coproduction are discussed. The combination of electricity and /sup 60/Co production appears to be one of the most attractive.

17506 **Radioisotope production in fusion reactors.** Engholm, B.A.; Cheng, E.T.; Schultz, K.R. (GA Technologies Inc., San Diego, CA 92138). *Fusion Technology;* **10**: No. 3, 1290-1296(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Radioisotope production in fusion reactors is being investigated as part of the Fusion Applications and Market Evaluation (FAME) study. /sup 60/Co is the most promising such product identified to date, since the /sup 60/Co demand for medical and food sterilization is strong and the potential output from a fusion reactor is high. Some of the other radioisotopes considered are /sup 99/Tc, /sup 131/I, several Eu isotopes, and /sup 210/Po. Among the stable isotopes of interest are /sup 197/Au, /sup 103/Rh and Os. In all cases, heat or electricity can be co-produced from the fusion reactor, with overall attractive economics.

17507 **First wall and vacuum vessel analysis for Compact Ignition Tokamaks.** Listvinsky, G.; Weede, J.J.; Salem, S.L.; Wolfson, A. (TRW Inc., One Space Park, Redondo Beach, CA 90278). *Fusion Technology;* **10**: No. 3, 514-520(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

This paper describes the ongoing analysis efforts supporting the design of the first wall (FW) and vacuum vessel (VV) components for the Compact Ignition Tokamak (CIT). Thermal and stress analyses of FW graphite tiles have established a nominal tile thickness of 1.0 cm and a maximum allowable FW surface heat flux of 11.0 MW/m/sup 2/. Calculations have shown that for a cooldown time of one hour, the required tile to VV thermal conductance is > 0.1 W/K. Estimates of worst-case electromagnetic loads and resulting stresses on the VV during plasma disruptions have shown the maximum stress levels to be below the allowable limits for the VV material. These results demonstrate that the selected FW/VV concept is consistent with the design objectives.

17508 **Summary of recent results from the JAERI/U.S. Fusion Neutronics Phase I Experiments.** Nakamura, T.; Abdou, M.A. (Dept. of Reactor Engineering, Japan Atomic Energy Research Institute, Tokai-mura, Naka-gun, Ibaraki-ken, 319-11). *Fusion Technology;* **10**: No. 3, 541-548(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A series of integral neutronics experiments is in progress as a collaborative program between Japan Atomic Energy Research Institute (JAERI) and U.S. Department of Energy(DOE) on fusion blanket engineering. Three types of experiments were conducted on lithium oxide as the Phase I of the program. Measured parameters are tritium production rates and neutron spectrum in test blanket modules. The results obtained in the collaboration are described along with the features of this program.

17509 **Analyses and intercomparison for Phase I Fusion Integral Experiments at the FNS Facility.** Youssef, M.Z.; Gung, C.; Nakagawa, M.; Mori, T.; Kosako, K.; Nakamura, T. (Mechanical, Aerospace and Nuclear Engineering Dept., Univ. of California at Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 549-563(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Phase I integral experiments of U.S./JAERI Collaborative Program on Fusion Breeder Neutronics which are carried out at the Fusion Neutronics Source (FNS) facility at JAERI ranged from D-T neutron source characterization experiments, tritium production rate (TPR) measurements in a reference Li/sub 2/0 assembly, first wall experiments with and without coolant simulation and beryllium neutron multiplier experiments in various configurations. Both U.S. and Japan have independently analyzed these experiments using their own data base and codes. Analytical predictions obtained by both countries are compared to measured values. Results of this intercomparison is presented in this paper.

17510 **Status of fusion reactor blanket design.** Smith, D.L.; Sze, D.K. (9700 South Cass Avenue, FPP-205, Argonne, IL 60439-4837). *Fusion Technology;* **10**: No. 3, 599-608(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

This paper provides a brief review of the Blanket Comparison and Selection Study (BCSS)/sup 1/ and an overview of more recent fusion reactor blanket design efforts. Specific areas covered include improvements in leading blanket concepts identified in the BCSS, viz., self-cooled liquid metal concepts, helium-cooled solid breeder concepts, and helium-cooled liquid breeder concepts. In addition, a summary of innovative blanket concepts and design features is presented. The key features and critical issues associated with these designs are identified.

17511 **Thin blanket design for MINIMARS - A compact tandem mirror fusion reactor.** Sviatoslavsky, I.N.; Sawan, M.E.; El-Guebaly, L.A.; Wittenberg, L.J.; Corradini, M.L.; Vogelsang, W.F.; Kulcinski, G.L. (Univ. of Wisconsin, Fusion Technology Institute, Nuclear Engineering Dept., 1500 Johnson Drive, Madison, WI 53706-1687). *Fusion Technology;* **10**: No. 3, 609-614(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Recent fusion power reactor designs have shown a trend toward lower power, lower cost, higher mass utilization compact configurations with inherent safety, in order to improve the economic aspects of fusion and make them more competitive with other energy sources. Since the blanket thickness directly impacts the size and mass of the remaining reactor components, it is prudent to minimize its thickness while ensuring adequate neutronic and thermal performance. This paper describes the blanket for the MINI-MARS compact tandem mirror fusion power reactor. The blanket which utilizes HT-9 ferritic steel structure, LiPb breeder, Be multiplier/moderator and He gas cooling is only 17 cm thick and is backed up by a steel reflector. Helium gas cools the blanket and reflector in series and the outlet temperature of 575°C gives a gross thermal power cycle efficiency of 42.7%.

17512 **An inherently safe tandem mirror fusion blanket concept.** Garner, J.K.; Carson, C.F.; Gordon, J.D.; Whitley, R.H. (TRW Inc., One Space Park, Redondo Beach, CA 90278). *Fusion Technology;* **10**: No. 3, 615-618(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

This paper describes a concept for a high performance, inherently safe fusion reactor blanket using helium coolant, beryllium multiplier, lithium breeder and a vanadium alloy structure. The goals of the design were to explore the possibility of inherent tolerance to loss of coolant and flow accidents while minimizing the cost of electricity. Results indicate high net thermal-to-electric conversion efficiency (45.5%), good energy multiplication (1.64) and excellent afterheat tolerance, with a maximum blanket temperature of 760°C after one year with no cooling. However, the calculated COE (0.0405$/kW/sub e/.h) is slightly higher than other blankets costed on a similar basis by the MINIMARS program because of the projected high cost of vanadium.

17513 **Helium-cooled, FLiBe-breeder, beryllium-multiplier blanket for MINIMARS.** Moir, R.W.; Lee, J.D. (Lawrence Livermore National Lab., Univ. of California, P.O. Box 808, L-644, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 619-623(Nov 1986). (CONF-860652—). Contract W-7405-ENG-48.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The authors adapt the helium-cooled, FLiBe-breeder blanket to the commercial tandem-mirror fusion-reactor design, MINIMARS. Vanadium is used to achieve high performance from the high-energy-release neutron-capture reactions and from the high-temperature operation permitted by the refractory property of the material, which increases the conversion efficiency and decreases the helium-pumping power. Although this blanket has the highest performance among the MINIMARS blankets designs, measured by Mn/sub th/ (blanket energy multiplication times thermal conversion efficiency), it has a cost of electricity (COE) 18% higher than the University of Wisconsin (UW) blanket design (42.5 vs 35.9 mills/kW . h). This increased cost was due to using higher-cost blanket materials (beryllium and vanadium) and a thicker blanket, which resulted in higher-cost central-cell magnets and the need for more blanket materials. Apparently, the high efficiency does not substantially affect the COE. Therefore, in the future, they recommend lowering the helium temperature so that ferritic steel can be used. This will result in a lower-cost blanket, which may compensate for the lower performance resulting from lower efficiency.

17514 **Conceptual design of a self-cooled FLIBE blanket.** Sze, D.K.; Jung, J.; Cheng, E.T.; Piet, S.; Klein, A. (Argonne National Lab., 9700 S. Cass Avenue, FPP-205, Argonne, IL 60439-4837). *Fusion Technology;* **10**: No. 3, 624-632(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A self-cooled Flibe blanket concept is developed. The problems associated with tritium breeding, tritium containment, and corrosion are investigated and potential solutions developed. A highly efficient and compact blanket and power conversion system is incorporated. The resulting system is low pressure with high thermal efficiency and is inherently safe.

17515 **Thin blanket designs for the Elongated Tokamak Commercial Reactor.** Wong, C.P.C.; Bourque, R.F.; Cheng, E.T.; Creedon, R.L.; Schultz, K.R. (GA Technologies Inc., San Diego, CA). *Fusion Technology;* **10**: No. 3, 633-640(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Elongated Tokamak (ET)* is an innovative concept that uses as highly elongated plasma (plasma height-to-width ratio of 6-10) to allow high plasma current and high toroidal betas. ET has the potential for the development of small-size, high-power density, low-cost fusion reactors using normal conducting coils. The elongated plasma shape is achieved by use of a continuous stack of PF coils parallel to the plasma surface on both inbound and outbound

sides. To achieve plasma stability, these coil stacks must be located no further than one plasma minor radius from the plasma edge, greatly restricting the space available for blankets. In order to assess the potential of a small reactor, the authors evaluated and designed blankets 30 to 40 cm thick. Three different thin blanket designs were found to be acceptable: FLiBe self-cooled, helium-cooled lithium, and helium-cooled 17Li83Pb blanket designs. A lithium-cooled integrated blanket-coil design (BLITZ-coil) was also found to be suitable for the ET commercial reactors.

17516 **Applications of the Aqueous Self-Cooled Blanket concept.** Steiner, D.; Embrechts, M.J.; Varsamis, G.; Wrisley, K.; Deutch, L.; Gierszewski, P. (Rensselaer Polytechnic Institute, Troy, NY 12180-3590). *Fusion Technology;* **10**: No. 3, 641-648(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

In this paper a novel water-cooled blanket concept is examined. This concept, designated the Aqueous Self-Cooled Blanket (ASCB), employs water with small amounts of dissolved fertile compounds as both the coolant and the breeding medium. The ASCB concept is reviewed and its application in three different contexts is examined: (1) power reactors; (2) near-term devices such as NET; and (3) fusion-fission hybrids.

17517 **A model for first-wall thermal response to plasma energy deposition.** Carroll, M.C.; Miley, G.H. (Fusion Studies Lab., Nuclear Engineering Dept., Univ. of Illinois, 103 South Goodwin Avenue, Urbana, IL 61801). *Fusion Technology;* **10**: No. 3, 770-775(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A primarily analytical thermal analysis model is presented which allows for calculation of temperatures in fusion reactor first walls. The model utilizes input from plasma physics calculations coupling a 2-1/2 dimensional geometric analysis with a 1-dimensional heat conduction treatment to determine temperature profiles over the surface of and within the first wall. The results are primarily applicable to the steady-state operation of magnetic confinement devices such as tokamaks. Effects of wall geometry, toroidal curvature, and wall corrugation are considered in computing local power loadings from bremsstrahlung, cyclotron radiation, charged particles, and neutrons. Temperature solutions based on these loadings are developed by expanding into a MacLaurin series and utilizing the principle of superposition. A sequential calculation scheme is employed in lieu of traditional matrix methods in determining temperature distributions in composite walls. The model and corresponding solution methods are applied to three illustrative fusion reactor designs. Significant gains in accuracy are indicated over thermal analysis methods previously used.

17518 **Techniques for measurement of velocity in liquid-metal MHD flows.** Reed, C.B.; Picologlou, B.F.; Dauzvardis, P.V.; Bailey, J.L. (Fusion Power Program, Argonne National Lab., Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 813-821(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Three instruments for measuring local velocities in liquid-metal MHD experiments for fusion blanket applications are being evaluated. The devices are used in room-temperature NaK experiments to measure three-dimensional flow field patterns anticipated in complex blanket geometries. Hot film anemometry, a standard technique in ordinary fluids, is being used, as well as two developmental devices. One is called the Liquid Metal Electromagnetic Velocity Instrument (LEVI), and performs essentially as a local DC electromagnetic flow meter. The third device, a Thermal Transient Anemometer (TTA) is a rugged, yet relatively simple device, which measures local velocity through the mechanism of convective heat transfer, in some ways similar to hot-film anemometry. Results are presented showing the kinds of data collected thus far with each instrument. Measurements include both local velocity measurements and some preliminary frequency analyses of the fluctuating signals from both a hot-film sensor and the LEVI device.

17519 **Uncertainties in liquid metal fusion blanket design windows.** Garner, J.K.; Abdou, M.A. (TRW Inc., One Space Park, R1/1078, Redondo Beach, CA 90278). *Fusion Technology;* **10**: No. 3, 837-847(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The work reported here attempts to: 1) define limits for the design windows for liquid metal breeders and coolants with various structural materials in various tokamak fusion reactors; and 2) quantify the impact of uncertainties in these limits on the design window. MHD pressure drop and heat transfer models are developed and used to quantify the effects of varying several tokamak reactor and blanket design parameters and materials properties. Uncertainties in the present pressure drop equations and calculational methods are also considered. Calculations are used to evaluate the impact of the coolant inlet temperature on the thermal cycle efficiency. An evaluation of the limits of uncertainty gives results ranging from a promising blanket candidate to a severely restricted design window, that would probably exclude self-cooled liquid metal blankets for large tokamaks from consideration. The major uncertainties in the design window result from the current lack of understanding of pressure drop and heat transfer in strong magnetic fields.

17520 **Lithium-cooled blankets for advanced tokamaks.** Picologlou, B.F.; Cha, Y.S.; Majumdar, S. (Argonne National Lab., 9700 S. Cass Avenue, Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 848-853(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The reactors considered in the Tokamak Power Systems Studies (TPSS), with their reduced toroidal magnetic flux densities, increased aspect ratios, and moderate overall power outputs afford the possibility of significant improvements and simplification in the design of liquid-metal self-cooled blankets. In designing the first wall and blanket structural, thermal, and magnetohydrodynamic constraints must be satisfied simultaneously. A systematic approach to do so efficiently, and resulting design parameters are presented. Designs with separate limiters can achieve a neutron wall loading capability of about 5 MW/m/sup 2/ with bare structural walls near the first wall and insulated laminated construction in regions of low fluence only. When laminated wall construction is used in the first wall coolant channels, the neutron wall loading capability exceeds 10 MW/m/sup 2/.

17521 **Entry length effects in liquid metal fusion blankets.** Hadid, A.H. (Mechanical, Aerospace and Nuclear Engineering Dept., Univ. of California, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 854-859(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The development of two dimensional velocity and temperature profiles are explored for a conducting fluid in the entrance region of straight ducts in the presence of a magnetic field. The partial-differential equations for the momentum and energy are solved by a finite-difference calculational procedure. In laminar flow parallel to the magnetic field, the magnetohydrodynamic (MHD) force is seen to enhance heat transfer slightly due to the suppression of velocity profile development. In laminar flow perpendicular to the magnetic field, higher fields enhance heat transfer by increasing the flow rate near the wall.

17522 **Experimental and analytical investigations of magnetohydrodynamic flows near the entrance to a strong magnetic field.** Picologlou, B.F.; Reed, C.B.; Dauzvardis, P.V. (Argonne National Lab., Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 860-865(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

An experimental program on liquid metal MHD phenomena relevant to blanket engineering is being carried out at ANL's ALEX facility. The experiments carried out at the facility are aimed towards detailed measurements of 3-D MHD flow character-

istics to enlarge the existing data base and to provide validation of existing analytical approaches. Results of the first series of experiments, dealing with three dimensional MHD effects in a circular thin conducting wall duct in the fringing field of a strong transverse magnetic field, are reported. Comparison of the experimental data with the predictions of pretest analysis both supports the basic premises on which the analysis is based and suggests possible improvements.

17523 **Overview of the TFTR Lithium Blanket Module program.** Jassby, D.L. (Princeton Plasma Physics Lab., Princeton, NJ 08544). *Fusion Technology;* **10**: No. 3, 925-930(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The LBM (Lithium Blanket Module) is an approximately cubic module, about 80 cm on each side, with construction representative of a helium-cooled lithium oxide fusion reactor blanket module. Measurements of neutron transport and tritium breeding in the LBM will be made in irradiation programs first with a point-neutron source, and subsequently with the D-D and D-T fusion-neutron sources of the TFTR. This paper summarizes the objectives of the LBM program, the design, development and construction of the LBM, and progress in the experimental tests.

17524 **The LBM program at the EPFL/LOTUS Facility.** File, J.; Jassby, D.L.; Tsang, F.Y.; Haldy, P.A.; Leo, W.R.; Woodruff, G. (Princeton Plasma Physics Lab., P.O. Box 451, Princeton, NJ 08544). *Fusion Technology;* **10**: No. 3, 952-957(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

An experimental program of neutron transport studies of the Lithium Blanket Module (LBM) is being carried out with the LOTUS point-neutron source facility at Ecole Polytechnique Federale de Lausanne (EPFL), Switzerland. Preliminary experiments use passive neutron dosimetry within the fuel rods in the LBM central zone, as well as, both thermal extraction and dissolution methods to assay tritium bred in Li/sub 2/O diagnostic wafers and LBM pellets. These measurements are being compared and reconciled with each other and with the predictions of two-dimensional discrete-ordinates and continuous-energy Monte-Carlo analyses of the Lotus/LBM system.

17525 **The neutronic analysis for the LBM/LOTUS experiment.** Kolibal, J.G.; Ku, L.P.; Liew, S.L. (Plasma Physics Lab., Princeton Univ., Princeton, NJ 08544). *Fusion Technology;* **10**: No. 3, 958-961(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A comparison of the two dimensional discrete ordinates and three dimensional Monte Carlo calculations for the Lithium Blanket Module at the LOTUS facility is made. These models are for comparison with the experimental data.

17526 **Lithium Blanket Module (LBM) dosimetry measurements at the LOTUS 14-MeV neutron source facility.** Tsang, F.Y.; Leo, W.; Sahraoui, C.; Wuthrich, S.; Shaer, M. (Idaho National Engineering Lab., (INEL), Idaho Falls, ID). *Fusion Technology;* **10**: No. 3, 962-971(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A series of passive dosimetry irradiation experiments were performed inside the Lithium Blanket Module (LBM) with the 14-MeV neutron source at the Ecole Polytechnique Federale de Lausane (EPFL). Sets of passive dosimetry foils were utilized to measure fusion-reactor-blanket neutronic environments. The dosimeter reaction data are analyzed and compared with calculational models. These experimental results demonstrate the ability to simulate low power deuterium-tritium (D-T) plasma shots by measuring the neutron field in a reactor-representative fusion blanket environment. The dosimeter results can determine the entire neutron spectrum along the full length of the LBM test rod. The set of selected dosimetry materials meets the requirements of neutronic characterization in future LBM-TFTR D-T and high power deuterium-deuterium (D-D) plasma experiments.

17527 **Tritium assay of Li/sub 2/O in the LBM/LOTUS experiments.** Quanci, J.; Azam, S.; Bertone, P. (Princeton Plasma Physics Lab., Princeton, NJ 08544). *Fusion Technology;* **10**: No. 3, 972-977(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Lithium Blanket Module (LBM) is an assembly of over 20,000 cylindrical lithium oxide pellets in an array representative of a limited-coverage breeding zone for a toroidal fusion device. A principal objective of the LBM program is to test the ability of advanced neutronics coding to model the tritium breeding characteristics of a fusion device blanket. The LBM has been irradiated at the Ecole Polytechnique Federale de Lausanne (EPFL) LOTUS facility with a 14 MeV point-neutron source. Princeton Plasma Physics Laboratory (PPPL) and EPFL assayed the tritium bred in lithium oxide diagnostic samples placed at various positions in the LBM. PPPL employed a thermal extraction technique while EPFL used a dissolution method. The results for the assay are reported and compared to MCNP Monte Carlo neutronics calculations for the LBM/LOTUS system.

17528 **Measurements of reactor-relevant electromagnetic effects with the FELIX facility.** Turner, L.R.; Hua, T.Q.; Knott, M.J.; Lee, S.Y.; McGhee, D.G.; Wehrle, R.B. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 1053-1058(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Recent experiments with the FELIX (Fusion Electromagnetic Induction eXperiment) facility at Argonne National Laboratory (ANL) suggest that the expected electromagnetic forces and torques in a tokamak first wall, blanket, and shield (FWBS) system can be modelled by a single eddy current mode, with a simple characterization.

17529 **Technical requirements of experiments and facilities for fusion nuclear technology.** Abdou, M.; Gierszewski, P.; Tillack, M.; Grover, J.; Puigh, R.; Sze, D.K.; Berwald, D. (Univ. of California, Los Angeles, CA). *Fusion Technology;* **10**: No. 3, 1065-1078(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The technical issues and requirements of experiments and facilities for fusion nuclear technology (FNT) are investigated. The nuclear subsystems addressed are: a) blanket; b) radiation shield; c) tritium processing system; and d) plasma interactive components. Emphasis is placed on the important and complex development problems of the blanket. A technical planning process for FNT is developed and applied, including four major elements: 1) characterization of issues; 2) quantification of testing requirements; 3) evaluation of facilities; and 4) development of a test plan to identify the role, timing, characteristics and costs of major experiments and facilities.

17530 **Required momentum, heat, and mass transport experiments for liquid metal blankets.** Tillack, M.S.; Sze, D.K.; Abdou, M.A. (Mechanical, Aerospace, and Nuclear Engineering Dept., The Univ. of California, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1088-1096(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The lack of experimental data for liquid metal blankets in the fusion environment restricts our ability to develop designs with demonstrated feasibility and adequately characterized performance. In order to confidently predict neutronic and thermal hydraulic performance of blankets, a variety of experiments will be needed. Ultimately, verification of all nuclear components will require testing in a fusion environment. However, a great deal of information can be obtained prior to fusion testing using non-neutron facilities to explore separate, multiple, and partially integrated effects. A large class of issues which can be effectively studied in a non-neu-

tron environment are those impacted by MHD transport phenomena. A coordinated test program is described to treat momentum, heat, and mass transport issues for liquid metal blankets.

17531 **Fission reactor experiments for solid breeder blankets.** Gierszewski, P.J.; Abdou, M.A.; Puigh, R. (Univ. of California at Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1097-1101(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The testing needs for solid breeder blanket development are different from those for liquid breeder blankets. In particular, a reasonable number of moderate volume test sites in a neutron environment are needed. Existing fission reactors are shown to be able to provide this environment with reasonable simulation of many important blanket conditions. Three major additional fission reactor tests are identified beyond those presently underway. These are thermal behavior, advanced in-situ tritium recovery and nuclear submodule experiments.

17532 **Issues and test requirements in radiation shielding of fusion reactors.** Nakagawa, M.; Abdou, M.A. (Mechanical, Aerospace and Nuclear Engineering Dept., Univ. of California, Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1123-1132(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Radiation shield issues for fusion reactors have been investigated and the experiments and facilities required to resolve the issues have been identified and characterized as part of the FINESSE program. This paper summarizes the recommended approach to fusion shield research and development, provides a summary of the necessary experiments and facilities, and presents the results of technical analyses involved.

17533 **The influence of reactor operations on the design and performance of tokamaks with solid-breeder blankets.** Ghoniem, N.M.; Firestone, M.A.; Conn, R.W. (Mechanical, Aerospace and Nuclear Engineering Dept., Univ. of California, Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1133-1145(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Operational aspects of a model tokamak system with a solid-breeder blanket are presented. The model blanket is an evolution of the STARFIRE and BCSS design studies. Full-power reactor operation is at a neutron wall loading of 5 MW/m/sup 2/ and a surface heat flux of 1 MW/m/sup 2/. The blanket is a pressurized steel module with bare beryllium rods and low-activation HT-9-(9-C-) clad LiAlO/sub 2/ rods. The helium coolant pressure is 5 MPa, entering the module at 297°C and exiting at 550°C. The system power output is rated at 1000 MW(e). In this paper, the authors present their findings on various operational scenarios and their impact on system design. They first start with the salient aspects of operational physics. Time-dependent analyses of the blanket and balance of plant are then presented.

17534 **Nuclear performance optimization of the molten-salt fusion breeder.** Lee, J.D.; Bandini, B.R. (Lawrence Livermore National Lab., Univ. of California, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 1309-1314(Nov 1986). (CONF-860652—). Contract W-7405-ENG-48.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Improved nuclear analysis, including the treatment of resonance and spatial self-shielding, coupled with an optimization procedure, has resulted in an improved performance estimate for the molten salt blanket. Net U-233 breeding ratio ranges between 0.58 and 0.63, and blanket energy multiplication ranges between 1.8 and 1.9.

17535 **System studies of Compact Ignition Tokamaks.** Galambos, J.D.; Peng, Y.K.M.; Blackfield, D.T. (Oak Ridge National Lab., Fusion Engineering Design Center, Post Office Box Y, Oak Ridge, TN 37831). *Fusion Technology;* **10**: No. 3, 498-503(Nov 1986). (CONF-860652—). Contract AC05-84OR21400.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Fusion Engineering Design Center (FEDC) Tokamak Systems Code is used to perform trade studies in accordance with the Compact Ignition Tokamak (CIT) physics and engineering guidelines. The authors examine various toroidal field coil (TFC) configurations, preload levels, and coil materials. Use of Inconel-copper composite material results in the smallest sized devices for both bucked and wedged TFCs and wedged-only TFCs. Preload levels of 23 Mkg are needed for the minimum sized devices, and for the lower strength materials, the minimum size is sensitive to the preload level. Results from these trade studies help lead to the choice of the baseline CIT point at R = 1.25 m and B = 10.4 T.

17536 **PF coil system comparisons for a compact ignition device.** Pillsbury, R.D. Jr.; Schultz, J.H.; Thome, R.J. (Plasma Fusion Center, NW17-223, Massachusetts Institute of Technology, Cambridge, MA 02139). *Fusion Technology;* **10**: No. 3, 504-507(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Preliminary designs for the poloidal field coil system for several alternative concepts for the Ignition Studies Project are analyzed. Options include both a limiter and divertor configuration with PF coils located internal to the TF coil, external to the TF coil, and a mixture of internal and external (hybrid coils). The effect of the system parameters of ampere-meters, stored and dissipated energy, and peak requirements are reported. The all internal coil configuration for the diverted plasma has significantly lower ampere-meters, energy, and power requirements. However, internal coils are disadvantageous from the remote maintenance standpoint.

17537 **Design study and supporting experiments for an axially symmetric anchor for a tandem mirror.** Kunze, J.F.; Prelas, M.A.; Dolan, T.J.; Bennett, P.; Freeman, J.M.; Haynes, L.; Hwang, J.L.; McGhee, S.D.; Roberts, R. (Univ. of Missouri, College of Engineering, Columbia, MO 65211). *Fusion Technology;* **10**: No. 3, 1034-1040(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

In order to determine if a simple magnetic cusp, which is axisymmetric, can be used as an end cell (anchor and plug) for a tandem mirror reactor, a large (50 cm) bore, superconducting, magnetic cusp is being built at the University of Missouri. Prior to the construction of this device, an approximately half scale normal magnetic cusp was built, and experiments involving ECRF heating were conducted, to better establish the design conditions for the large, high field (4-Tesla) cusp.

17538 **Liquid nitrogen cooling considerations of the Compact Ignition Tokamak.** Dabiri, A.E. (Fusion Engineering Design Center/SAIC, P.O. Box Y, FEDC Building, Oak Ridge, TN 37831). *Fusion Technology;* **10**: No. 3, 521-526(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A simple analytical procedure is developed to estimate the cooldown time between pulses of the Compact Ignition Tokamak (CIT) utilizing liquid nitrogen. Fairly good agreement is obtained between the analysis results and those measured in the early fusion experimental devices. The cooldown time between pulses in the CIT is controlled by the energy deposition in the inner leg of the TF coil. A cooldown time of less than 1 h is feasible. An R&D experimental program is required to determine the actual cooldown time between pulses since this would be considered an issue in the conceptual design of the CIT.

17539 **An evaluation of polarized fuels in a commercial deuterium/tritium tokamak reactor.** Finn, P.A.; Brooks, J.N.; Ehst, D.A.; Gohar, Y.; Mattas, R.F.; Baker, C.C. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 902-907(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The benefits and limitations arising from the use of polarized deuterium-tritium fuels are assessed for commercial tokamak fusion reactors. The difference in capital costs for a reactor with and without polarized fueling is quantified for two reactors, one with a beta of 0.067 and a major radius of 7 m and the second with a beta of 0.25 and a major radius of 5.25 m. The change in reactor performance is also quantified. The conclusion is that the sum of all benefits associated with the use of polarized fuels does not result in a significant improvement in the tokamak reactor economics.

17540 **A comparative study of tritium breeding calculations using JEF-1 and ENDF/B-V based nuclear data libraries.** Cheng, E.T.; Pelloni, S. (GA Technologies Inc., San Diego, CA). *Fusion Technology;* **10**: No. 3, 978-984(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A preliminary comparative neutronics study shows that there are large discrepancies in the /sup 6/Li(n,α)T and /sup 7/ Li(n,n'α)T reaction rates calculated for top-ranking fusion blanket concepts with the JEF-1- and ENDF/B-V- based nuclear data libraries. Detailed analysis is necessary and data testing integral experiments should be employed to identify the deficiencies in these nuclear data evaluations.

17541 **A folded waveguide coupler for ion cyclotron heating.** Owens, T.L.; Chen, G.L. (McDonnell Douglas Astronautics Co., Dept. E451, P.O. Box 516, St. Louis, MO 63166). *Fusion Technology;* **10**: No. 3, 1024-1029(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A new type of waveguide coupler for plasma heating in the ion cyclotron range of frequencies is described. The coupler consists of a series of interleaved metallic vanes within a rectangular enclosure analogous to a wide rectangular waveguide that has been "folded" several times. At the mouth of the coupler, a plate is attached which contains coupling apertures in each fold or every other fold of the waveguide, depending upon the wavenumber spectrum desired. This plate serves primarily as a wave field polarizer that converts coupler fields to the polarization of the fast magnetosonic wave within the plasma. Theoretical estimates indicate that the folded waveguide is capable of high-efficiency, multi-megawatt operation into a plasma. Bench tests have verified the predicted field structure within the waveguide in preparation for high-power tests on the Radio Frequency Test Facility at the Oak Ridge National Laboratory.

17542 **Free electron masers for tokamak applications.** Wagner, C.E.; Boehmer, H.; Caponi, M.Z. (TRW Inc., Redondo Beach, CA 90278). *Fusion Technology;* **10**: No. 3, 1030-1033(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The technology of the free electron maser (FEM) has advanced to where it now is an attractive source for electron cyclotron heating (ECH) in tokamaks at reasonable cost. FEM's are capable of producing CW power at frequencies 50-400 GHz with power levels up to 5 MW/module. They can operate as a high gain (30-40 db), wide band amplifier ($\Delta f/f$ = 5-10%). Such systems incorporate high quality (low emittance and energy spread) electron beams of moderate current which are electrostatically accelerated before passing through a large amplitude wiggler. Highly efficient recovery of the energy from the "spent" beam is feasible and enhances the total FEM system energy to nearly 50% even though the beam extraction efficiency is rather modest.

17543 **Super high field ohmically heated tokamak operation.** Cohn, D.R.; Bromberg, L.; Leclaire, R.J.; Potok, R.E.; Jassby, D.L. (MIT Plasma Fusion Center, Cambridge, MA 02139). *Fusion Technology;* **10**: No. 3, 1111-1116(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The authors discuss a super high field mode of tokamak operation that uses ohmic heating or near ohmic heating to ignition. The super high field mode of operation uses very high values of B/ sup 2/α, where B is the magnetic field and a is the minor radius (B/sup 2/α > 100 T/sup 2/m). We analyze copper magnet devices with major radii from 1.7 to 3.0 meters. Minimizing or eliminating the need for auxiliary heating has the potential advantages of reducing uncertainty in extrapolating the energy confinement time of current tokamak devices, and reducing engineering problems associated with large auxiliary heating requirements. It may be possible to heat relatively short pulse, inertially cooled tokamaks to ignition with ohmic power alone. However, there may be advantages in using a very small amount of auxiliary power (less than the ohmic heating power) to boost the ohmic heating and provide a faster start-up, expecially in relatively compact devices.

17544 **Tritium technology studies at the Tritium Systems Test Assembly.** Anderson, J.L.; Bartlit, J.R. (Materials Science and Technology Div., Los Alamos National Lab., Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 1329-1333(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Tritium Systems Test Assembly (TSTA) at the Los Alamos National Laboratory has been in operation with tritium since June 1984. Presently there are some 30 g of tritium in the main process loop. This 30 g has been sufficient to do a number of experiments involving the cryogenic distillation isotope separation systems. In January 1986, two major experiments were conducted. During these experiments the fuel cleanup system was interfaced, through the transfer pumping system with the isotope separation system, thus permitting testing on the integrated fuel processing loop. This integration of these systems means that of the TSTA subsystem only the vacuum system remains to be integrated into the TSTA fuel processing loop. In the period of June 1984 through May 1986, the TSTA system had processed approximately 10/sup 8/ Ci of tritium. Total tritium emissions to the environment over this period have been less than 3 Ci as elemental tritium and 2 Ci as tritium oxide. Personnel exposures during this period have totaled less than 100 person-mRem. To date, the development of tritium technology at TSTA has proceeded in progressive and orderly steps. In two years of operation with tritium, no major design flaws have been uncovered.

17545 **Residual tritiated water in molecular sieves.** Nasise, J.E.; Carlson, R.V.; Jalbert, R.A. (Materials Science and Technology Div., Los Alamos National Lab., Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 1334-1339(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Experiments are described which demonstrate that tritiated water inventory on molecular sieve can be reduced by loading the molecular sieve with water and subsequent regeneration. These experiments also show that to achieve low dewpoints air streams from a molecular sieve drying bed, regenerations times are much longer than routinely used in detritiation systems.

17546 **Inherent/passive safety for fusion.** Piet, S.J. (EG&G Idaho, Inc., P.O. Box 1625, Idaho Falls, ID 83415). *Fusion Technology;* **10**: No. 3, 1191-1196(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The concept of inherent or passive safety for fusion energy is explored, defined, and partially quantified. Four levels of safety assurance are defined, which range from true inherent safety to passive safety to protection via active engineered safeguard systems. Fusion has the clear potential for achieving inherent or passive

safety, which should be an objective of fusion research and design. Proper material choice might lead to both inherent safety and high mass power density, improving both safety and economics. When inherent safety is accomplished, fusion will be well on the way to achieving its ultimate potential and to be truly different and superior.

17547 **Fusion blanket inherent safety assessment.** Sze, D.K.; Jung, J.; Cheng, E.T. (Argonne National Lab., 9700 South Cass Avenue, FPP-205, Argonne, IL 60439-4837). *Fusion Technology;* **10**: No. 3, 1197-1204(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The inherent safety aspect of Tokamak Power System Studies (TPSS) reactor blankets is investigated. The idea is to design the blanket so safe that cost savings can be realized such as through non-nuclear grading construction. If the blanket materials are carefully selected, inherent safety is feasible for fusion reactor blankets up to 5-10 MW/m/sup 2/ neutron wall loading.

17548 **Passive decay heat removal in liquid-metal cooled reactors.** Malinovic, B.; Kazimi, M.S. (Dept. of Nuclear Engineering, Massachusetts Institute of Technology, Cambridge, MA 02139). *Fusion Technology;* **10**: No. 3, 1205-1210(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The response of liquid metal self-cooled fusion reactors to a loss of flow accident (LOFA) is investigated. Coolant temperature rise through the blanket was determined for conditions where decay heat is removed solely by natural convection. It is found that lithium-lead (Li17-Pb83) coolant provides sufficient natural convection to remove decay heat in both tokamak and TMR designs with a reasonable temperature rise. With pure lithium coolant, however, decay heat removal by natural convection proves difficult without excessive temperature rise. A transient analysis reveals that there should be ample time to respond to a LOFA if the plasma is shut down promptly.

17549 **Some safety considerations of liquid lithium as a fusion breeder material.** Jeppson, D.W.; Muhlestein, L.D. (Westinghouse Hanford Co., Hanford Engineering Development Lab., P.O. Box 1970, Richland, WA 99352). *Fusion Technology;* **10**: No. 3, 1211-1215(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Test results and conclusions are presented for the reaction of steam with a high temperature lithium pool and for the reaction of high temperature lithium spray with a nitrogen atmosphere. The reactions are characterized and evaluated in regard to the potential for mobilization of radioactive species associated with the liquid breeder under postulated fusion reactor accident conditions. These evaluations include measured lithium temperature responses, atmosphere temperature and pressure responses, gas consumption and generation, aerosol quantities and particle size characterization, and potentially radioactive species releases. Conclusions are made as to the consequences of these safety considerations for the use of lithium as a fusion reactor breeder material.

17550 **Survey of selected magnet failures and accidents.** Thome, R.J.; Czirr, J.B.; Schultz, J.H. (Plasma Fusion Center, MIT, NW17-205, Cambridge, MA 0219). *Fusion Technology;* **10**: No. 3, 1216-1222(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A survey was conducted among the major centers of large magnet development and operation in the USA to obtain information on magnet system failure and accident events. This paper summarizes the results in four tables which indicate the criticality, "why," "where," and "how" of the reported events. A brief summary of each of the 31 events covered in the survey is also included.

17551 **Contamination of aluminum and painted surfaces exposed to tritium.** Jalbert, R.A.; Brereton, S.J.; Holland, D.F. (Los Alamos National Lab., Health, Safety, and Environment Div., Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 1223-1227(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

To study the problem of outgassing of contaminated room surfaces following a significant tritium (T) room release, painted metal strips were exposed to tritium (T/sub 2/ or HTO) and the outgassing rates measured. This was followed by exposures in a 1-m/sup 3/ chamber, whose walls were coated with the material to be studied. The results show that the differences in the contamination of, and subsequent outgassing by, several epoxy and latex paints may be significant. The greatest differences, however, were the much higher contamination following exposure to HTO compared to T/sub 2/, and the lower contamination of exposed bare aluminium foil compared to painted surfaces, for both HTO and T/sub 2/.

17552 **Laser generation of particles to simulate aerosols from fusion systems.** Hoover, M.D.; Allen, M.D.; Simpson, R.B.; Yeh, H.C. (Lovelace Inhalation Toxicology Research Institute, P.O. Box 5890, Albuquerque, NM 87185-5890). *Fusion Technology;* **10**: No. 3, 1228-1233(Nov 1986). (CONF-860652—). Contract AC04-76EV01013.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A pulsed Nd:YAG laser is being used to aerosolize material from the surface of metal targets to simulate particles created in fusion energy systems. Targets in the form of rods up to 2-cm diameter can be attached to a screw mechanism that exposes a fresh surface for each laser pulse. Energies up to 20 J/pulse can be applied to the target, at pulse rates from a single shot to 300 Hz. Energy can be focused on an area with diameter less than 500 μm. Stainless steel and aluminium targets were used in a demonstration of system performance. The branched-chain ultrafine aggregate aerosols that were produced appeared to result from direct vaporization/condensation of material from the surface of the target located under the center of the laser beam, and from ejection of molten droplets from the target surface.

17553 **TFTR offsite dose levels from fusion radiation and effluent releases.** Kolibal, J.G.; Ku, L.P.; Liew, S.L. (Plasma Physics Lab., Princeton Univ., Princeton, NJ 08544). *Fusion Technology;* **10**: No. 3, 1234-1242(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A comprehensive assessment of the offsite radiological impact of the operation of the Tokamak Fusion Test Reactor is made. This includes a review of the dose levels from instantaneous fusion radiation for the case with no first shield wall around the tokamak, and from the release of radionuclides to the air. The dispersion analysis is based on local on-site meteorological data which has recently become available.

17554 **In-situ MHD energy conversion for fusion.** Campbell, R.B.; Logan, B.G.; Hoffman, M.A. (TRW Corp., Redondo Beach, CA 90278). *Fusion Technology;* **10**: No. 3, 881-889(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

An advanced concept, in-situ MHD conversion, is described for converting fusion energy to electricity. Considerable cost savings can be realized because of the conversion of thermal energy to electricity achieved in the blanket by means of magnetohydrodynamic (MHD) generators. The external disk generator, also described, is another application of the MHD idea, which may have certain advantages over the in-situ scheme for advanced-fuel tokamaks. The feature that makes these schemes fusion-specific is the novel use of the electromagnetic radiation naturally emitted by the plasma. The synchrotron radiation can be used either to heat the nonequilibrium MHD plasma, or possibly improve its stability. A Rankine cycle with cesium-seeded mercury as a working fluid is used in either case. Performance predictions by a quasi-one-dimen-

sional model are presented. An experiment to determine the effect of microwave radiation on channel performance is planned.

17555 **Direct converter design for the MINIMARS Tandem Mirror Reactor.** Luzzi, T.E.; Clarkson, I.R. (Grumman Corp., Bethpage, NY 11714). *Fusion Technology;* **10**: No. 3, 908-913(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The authors report on the final design of the direct converter for MINIMARS, a tandem mirror power reactor project at the Lawrence Livermore National Laboratory. The project objectives are to design a plant to produce electricity at less than 50 mils/kWh and design an inherently safe plasma shutdown and heat transport system that sustains no damage from loss of coolant and loss of flow. The direct converter coolant like the blanket coolant is used to generate primary turbine steam. All thermo and structural load bearing elements are designed for the reactor lifetime. The halo scraper sputter lifetime is five full power years. The power to circulate the helium coolant through the direct converter elements is less than 5% of the thermal power recovered.

17556 **ICF drivers: A comparison of some new entries and old standbys.** Hogan, W.J. (Lawrence Livermore National Lab., P.O. Box 5508, L-480, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 649-655(Nov 1986). (CONF-860652—). Contract W-7405-ENG-48.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

There has been a great deal of progress in recent years on the development of solid state and KrF lasers, light ion diodes, and heavy ion accelerators for use as drivers in inertial confinement fusion (ICF) facilities. Two relatively new entries in the ICF driver derby are the free electron lasers (FEL) and the compact torus (CT). The status and remaining technological challenges of each potential driver are described. The author discusses driver performance criteria for various reactor applications and then gives his informed opinion in a qualitative rating of the six drivers for each application.

17557 **Ion beam trapping in plasma channels for light ion inertial confinement fusion.** Watrous, J.J.; Olson, R.E. (Target Experiments, Div. 1263, Sandia National Labs., Albuquerque, NM 87185). *Fusion Technology;* **10**: No. 3, 664-673(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Conservation laws and solutions to ion equations of motion have been used to obtain estimates of the maximum ion beam power that can be injected into and trapped within z-discharge plasma channels. Consequences of the results of these calculations for ongoing designs of light ion driven inertial confinement fusion experiments and reactor concepts are discussed.

17558 **Conceptual design of a large E-beam-pumped KrF laser for ICF commercial applications.** Harris, D.B.; Waganer, L.M.; Zuckerman, D.S.; Bowers, D.A. (Los Alamos National Lab., P.O. Box 1663, MS F611, Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 674-676(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Two types of KrF lasers appear attractive as a driver for an ICF electric power plant. The original concept uses large electron-beam-pumped amplifiers and pure angular multiplexing to deliver short, shaped pulses to the target. A recently conceived alternate concept uses many small, long-pulse e-beam sustained discharge lasers which transfer their energy through the forward Raman process to a multiplexed set of beams to deliver the energy to target. Preliminary comparisons of the two systems indicate that the original concept has both a lower cost and a lower system efficiency, and both concepts appear to be nearly equally attractive as an ICF driver for an electric power plant. This paper examines a 4.8 MJ, 5 Hz KrF laser system designed using the original concept. The laser uses 24 main amplifiers arranged in eight sets of three amplifiers each. This layout optimizes both the optical system and the gas flow system, and uses a simple target illumination scheme that provides neutron shielding to allow hands-on maintenance in the laser hall.

17559 **Conceptual design of a hybrid KrF laser system for ICF commercial applications.** Harris, D.B.; Lowenthal, D.D. (Los Alamos National Lab., P.O. Box 1663, MS F611, Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 677-678(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

KrF lasers appear to be the most efficient lasers operating near the optimal wavelength for laser fusion. Most high-efficiency, low-cost KrF laser designs use large electron-beam driven amplifiers and use pure angular multiplexing for the required pulse compression. A recent study carried out by Los Alamos and Spectra Technology has defined a high-efficiency hybrid KrF laser system architecture that uses both angular multiplexing and Raman beam combination. The high overall system efficiency of this hybrid design, approximately 12%, is achieved primarily through the use of e-beam sustained discharge lasers (EBSDL), and by using the efficient forward rotational Raman process in hydrogen. The new system appears attractive as a commercial-applications driver because the calculated efficiency is higher than the usual large e-beam pumped (EBP) KrF laser/pure angular multiplexing approach. In this paper, the hybrid system architecture is described, and the tradeoffs with respect to the large EBP amplifier/angular multiplexed system are discussed.

17560 **The Compact Torus Accelerator: A driver for ICF.** Tobin, M.T.; Meier, W.R.; Morse, E.C. (Lawrence Livermore National Lab., P.O. Box 5508, L-480, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 679-685(Nov 1986). (CONF-860652—). Contract W-7405-ENG-48.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The authors have carried out further investigations of technical issues associated with using a compact torus (CT) accelerator as a driver for inertial confinement fusion (ICF). In a CT accelerator, a magnetically-confined, torus-shaped plasma is compressed, accelerated and focused by two concentric electrodes. They evaluate an accelerator point design with a capacitor bank energy of 9.2 MJ. Modeled by a O-D code, the system produces a xenon plasma ring with a radius of 0.73 cm, a velocity of 4x10/sup 7/m/s, and a mass of 4.4 μg. The plasma ring energy available for fusion is 3.8 MJ, a 40% driver efficiency. Ablation and magnetic pressures of the point design, due to CT acceleration, are analyzed. Pulsed-power switching limitations and driver cost analysis are also presented. Our studies confirm the feasibility of producing a ring to induce fusion with acceptable gain. However, some uncertainties must be resolved to establish viability.

17561 **Initiation of long electrical discharges in dense ICF reactor atmospheres.** Kislev, H.; Micklich, B.J. (Dept. of Nuclear Engineering, Univ. of Illinois at Urbana-Champaign, 103 S. Goodwin Avenue, Urbana, IL 61801). *Fusion Technology;* **10**: No. 3, 686-694(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The initiation of straight breakdown paths has been identified as the key issue of the LIB propagation channel formation scheme in the HWIFR dense atmosphere. Straight preionization trails have been suggested as means for guiding the breakdown along the designated beamlines. A multi-group Boltzmann equation solver has been constructed for estimating the capability of several preionizers to induce such trails in dense D/sub 2/O vapors. A new approach capable of predicting the steady state streamer wave shape is used to estimate the minimum conditions for launching a streamer in the preionized path. The electrical resistance of the trail during the streamer propagation is evaluated with a simple one dimensional routine. Finally the transition of the streamer induced ionized filament to a multi-kA-carrying plasma channel is simulated with a modified radiation MHD code. Other results of this study, including the determination of the preionizer intensity and the minimum applied potential required for the initiation, are presented in this paper.

17562 **Turbostar: An ICF reactor using both direct and thermal power conversion.** Pitts, J.H. (Lawrence Livermore National Lab., P.O. Box 5508, L-480, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 695-703(Nov 1986). (CONF-860652—). Contract W-7405-ENG-48.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Combining direct and thermal power conversion results in a 52% gross plant efficiency with DT fuel and 68% with advanced DD fuel. The authors maximize the fraction of fusion-yield energy converted to kinetic energy in a liquid-lithium blanket, and use this energy directly with turbine generators to produce electricity. They use the remainder of the energy to produce electricity in a standard Rankine thermal power conversion cycle.

17563 **Heavy-ion fusion target cost model.** Pendergrass, J.H.; Harris, D.B.; Dudziak, D.J.; Billman, K.W. (Los Alamos National Lab., P.O. Box 1663, Mail Stop F611, Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 1243-1244(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Previous inertial confinement fusion (ICF) commercial-applications studies typically used simple treatments for target costs due to optimism about low (and hence less-important) costs, limited target concept and mass-production process definition, limited resources for analysis, and concentration on point designs. Examples include a fixed cost per target and a fixed target factory capital cost, multiplied by a fixed O&M cost factor, and a fixed target materials cost. Recent studies indicate larger target cost contributions to total power production cost than the $< 10\%$ assumed in many earlier studies, especially for high pulse repetition rates and low target gains. The Heavy-Ion Fusion Systems Assessment (HIFSA) study will include more realistic estimates for target costs. The HIFSA project is a study led by Los Alamos of the prospects for successful commercial ICF electric power using heavy-ion induction linear accelerator (linac) drivers. It assembled unique resources from national laboratories, universities, and industry permitting significant advances in commercial-applications HIF target and mass-production process characterization. The project includes optimization studies with significantly different target concepts requiring improved target cost models for meaningful comparisons. In addition to target performance parameters, optimum target designs depend on driver, reactor, fuel cycle and balance-of-plant system characteristics for which several alternative concepts have been proposed. Therefore, generic stand-alone target cost/performance models that can be interfaced with a wide variety of cost/performance models for other plant systems are being developed for the HIFSA study.

17564 **Improved understanding of first-wall vaporization-condensation in inertial confinement fusion reactors.** Orth, C.D. (Lawrence Livermore National Lab., P.O. Box 5508, L-481, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 1245-1250(Nov 1986). (CONF-860652—). Contract W-7405-ENG-48.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The authors report approximate x-ray and debris spectra emanating from a region of compressed DT fuel representing the imploded configuration of a generic direct-drive ICF reactor pellet. They show how the spectra are modified by spherical lead shields of various thicknesses placed near the pellet, and show that it is not possible to lessen the ablation of the first wall or blanket of a low-pressure ICF reactor chamber through use of such shields. Then they report that the calculated x-ray spectra alone (i.e., without the associated debris) cause vaporization of a first wall placed at a radius of 4 m that is much more than previously expected. This result increases the importance of understanding the details of the vaporization and condensation phenomena.

17565 **Scaling of vaporization and condensation in heavy ion fusion reactors.** Peterson, R.R. (Dept. of Nuclear Engineering, Univ. of Wisconsin-Madison, 1500 Johnson Drive, Madison, WI 53706-1687). *Fusion Technology;* **10**: No. 3, 1251-1252(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The vaporization and condensation of material in the reaction chamber of a heavy ion beam driven Inertial Confinement Fusion (ICF) reactor can have important consequences on the facility design. The condensation of material that has been vaporized by energy from the target can limit the rate at which targets can be exploded. The repetition rate is limited because, depending on the mode of propagation of heavy ions to the target, there are limits on the density of vapor in the reaction chambers at the time of beam injection. If the mission of the reactor is to produce commercial electric power, limitation of the repetition rate can greatly affect the cost of electricity, while additional reaction chambers can make the overall plant design much more complicated.

17566 **Numerical simulation of an ICF target explosion in a stratified gas atmosphere.** Bartel, T.J.; Peterson, R.R.; Moses, G.A. (Fusion Technology Institute, Univ. of Wisconsin, 1500 Johnson Drive, Madison, WI 53706-1687). *Fusion Technology;* **10**: No. 3, 1253-1258(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Two-dimensional radiation hydrodynamic simulations of a light ion fusion target generated microfireball in a stratified gas atmosphere have been performed. The target location in a two region cavity was varied with the intent to reduce the overpressure on the diodes at the walls of a target chamber with a single cavity gas. Helium and nitrogen at 15 torr were used as the cavity gases; target explosions of 200 and 800 MJ were investigated. It was found that placing the target in a helium region surrounded by nitrogen could reduce the overpressure by a factor of 2 when compared with a single gas cavity of nitrogen. The surface heat flux was also reduced from a pure helium gas cavity.

17567 **MHD energy conversion with advanced-fuel ion beam fusion.** Miley, G.H. (Fusion Studies Lab., Univ. of Illinois, Dept. of Nuclear Engineering, 103 South Goodwin Avenue, Urbana, IL 61801). *Fusion Technology;* **10**: No. 3, 1259-1263(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

This study considers variations in a basic deuterium-burning target design (AFLINT) that modify the output energy split among neutrons, X-rays, and charged particles. Use of a liquid metal MHD cycle to extract energy from a twin-fall reaction chamber (LOTRIT) that uses these targets is also described.

17568 **Liquid momentum removal using rod arrays applied to the HYLIFE ICF reactor.** Raffray, A.R.; Hoffman, M.A. (Mechanical, Aerospace, and Nuclear Engineering Dept., Univ. of California, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1264-1269(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

This research relates to the multiple liquid-lithium-jet blanket concept for the HYLIFE inertial-confinement fusion (ICF) reactor. The fusion micro-explosion would result in part of the liquid lithium being propelled towards the vacuum chamber wall where the resulting impact would cause high peak stresses. In an attempt to reduce these peak stresses, it was proposed to set up an array of bars between the vacuum vessel first wall and the liquid jets so that part of the liquid momentum would be removed as the liquid passed through the bars. A series of small-scale scoping experiments were run to obtain a preliminary evaluation of the effectiveness of such rod arrays in removing momentum from impinging liquid slugs. The impact force of an unconfined cylindrical water jet on in-line and staggered rod arrays was measured. The results indicate that the fraction of momentum removed from liquid slugs could probably exceed 18% for a staggered rod arrangement in the HYLIFE reactor.

17569 **A fiber sensor neutron streak camera for ICF diagnostics.** Kislev, H.; Miley, G.H. (Fusion Studies Lab., Nuclear Engineering Dept., Univ. of Illinois, 103 South Goodwin Avenue, Urbana, IL 61801). *Fusion Technology;* **10**: No. 3, 1270-1278(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The authors propose an optical sensing based neutron streak camera for ICF burn studies. The conversion of the neutron flux to optical signal is gained through measuring the time dependent optical attenuation (darkening) of a fissile material doped fiber optics. The miniature sensor enables a sensing distance of > 2 cm from the target, such that the neutron doppler broadening can be neglected. An additional major advantage over the current designs is that the streak camera is removed from the intense radiation field. Estimates of minimum yield requirements, darkening time response, and overall temporal resolution are presented.

17570 **Maintainability features of the Compact Ignition Tokamak.** Spampinato, P.T.; Bushnell, C.W. (Fusion Engineering Design Center, Grumman Aerospace Corp., Oak Ridge National Lab., P.O. Box Y, FEDC Building, Oak Ridge, TN 37831). *Fusion Technology;* **10**: No. 3, 527-532(Nov 1986). (CONF-860652—). Contract AC05-84OR21400.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Compact Ignition Tokamak is envisaged to be the next experimental reactor in the U.S. Fusion Program. Its use of deuterium/tritium fuel requires the implementation of remote handling technology for maintenance and disassembly operations. The reactor is surrounded by a close-proximity nuclear shield which is designed to permit personnel access within the test cell, one day after shutdown. With the shield in place, certain maintenance activities in the test may be done hands-on. Maintenance on the reactor is accomplished remotely using a crane-mounted manipulator after disassembling the shield. Maintenance within the plasma chamber is accomplished with two articulated boom manipulators that are capable of operating in a vacuum environment. They are stored in a vacuum enclosure behind movable shield plugs. The maintenance-related facilities are the test cell, hot cell, decontamination cell, warm cell, and the fabrication, assembly, and mockup building.

17571 **TFTR basement radiation fluence calculations and comparisons with measurements.** Liew, S.L.; Ku, L.P.; Kolibal, J.G. (Plasma Physics Lab., Princeton Univ., Princeton, NJ 08544). *Fusion Technology;* **10**: No. 3, 591-598(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Neutron and γ-ray fluences in the diagnostic basement of the Tokamak Fusion Test Reactor (TFTR) facility are calculated with realistic three-dimensional Monte Carlo models. Comparisons with measurements show that the results are well within the experimental uncertainties.

17572 **Radiation effects on structural ceramics in fusion.** Hopkins, G.R.; Price, R.J.; Trester, P.W. (GA Technologies Inc., P.O. Box 85608, San Diego, CA 92138). *Fusion Technology;* **10**: No. 3, 719-727(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The use of ceramics in fusion power reactors is reviewed. Radiation effects can limit the useful lifetime of ceramic components by changing the dimensions, mechanical properties, thermal conductivity, and electrical properties. The brittleness and statistical spread in strength of monolithic ceramics causes problems for mechanical design which may be alleviated by the use of new ceramic/ceramic composites. Recently developed SiC fiber/SiC matrix composites have good mechanical properties which are likely to be retained after neutron irradiation.

17573 **Recent progress in subsized Charpy impact specimen testing for fusion reactor materials development.** Lucas, G.E.; Odette, G.R.; Sheckherd, J.W.; Krishnadev, M.R. (Dept. of Chemical and Nuclear Engineering, Univ. of California, Santa Barbara, CA 93106). *Fusion Technology;* **10**: No. 3, 728-733(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Charpy impact specimens, one third the size of standard specimens in all dimensions have been tested for a variety of steels and the data are compared to standard specimen data. The absorbed energy curves are qualitatively similar for both specimen types, and quantitative evaluations of dynamic yield strength and cleavage fracture stress are similar as well. However, differences in constraint between standard and subsized specimens must be accounted for, and these differences are influenced by the flow behavior of the test material.

17574 **Incorporating plastic collapse into the linear elastic fracture mechanics methodology in determining crack propagation lifetimes.** Glasgow, B.B.; Wolfer, W.G. (Nuclear Engineering, Univ. of Wisconsin, Madison, WI 53706). *Fusion Technology;* **10**: No. 3, 734-740(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Crack growth can result in a breech of a pressure boundary causing coolant loss or in total structural failure. This paper discusses brittle and plastic failure in terms of a unified structural model called the Two Criteria model. The model takes into account the flow stress of the material as well as the fracture toughness. Our results indicate that for fusion reactor first wall structures, ferritic steel is better able to resist crack propagation and subsequent structural failure than 316 stainless steel under the same wall loadings and geometry.

17575 **Superconducting magnet radiation effects in fusion reactors.** Sawan, M.E.; Walstrom, P.L. (Univ. of Wisconsin, Fusion Technology Institute, Nuclear Engineering Dept., 1500 Johnson Drive, Madison, WI 53706-1687). *Fusion Technology;* **10**: No. 3, 741-746(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Radiation effects in superconducting magnets of fusion reactors are analyzed and experimental data reviewed. The interaction between the different radiation effects and impact on reactor design is discussed. The need for experimental data with higher irradiation levels is assessed.

17576 **FLiBe-vanadium alloy system corrosion product radiation hazards analysis.** Klein, A.C.; Sze, D.K. (Dept. of Nuclear Engineering, Oregon State Univ., Corvallis, OR 97331). *Fusion Technology;* **10**: No. 3, 747-752(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

An assessment is made of the gamma radiation hazards likely to be found near a fusion reactor which employs a vanadium alloy for the blanket and first wall structure, ferritic-steel HT9 for the remainder of the loop and molten salt FliBe as coolant/tritium breeding fluid. Since the radiation levels near the primary loop components are found to be less than 100 mR/hr 3-5 days after shutdown after three years of continuous full power operation, limited hands-on maintenance is conceivable. The very short half-lives of the predominant corrosion products make this result possible and make such a system very attractive.

17577 **Pump limiter experiments and engineering.** Goebel, D.M. (School of Engineering and Applied Science, Center for Plasma Physics and Fusion Engineering, Univ. of California, Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 761-769(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Particle removal from tokamak plasmas is essential to achieve density control and some measure of impurity control. This requirement can be satisfied by pump limiters, the present status of which is reviewed here. Modular experiments have recently achieved particle removal rates over 10 torr-l/sec. Studies of impurity removal by pump limiters have demonstrated He and N/sub 2/ (moderate Z) exhaust. Successful modeling of the pump limiter performance using Monte-Carlo neutral gas codes has expanded the understanding of the physics of pump limiters. The heat flux to the surface of limiters in tokamaks has been studied in detail. The rapid

progress in the engineering, theory, and experimental results of pump limiters has led to plans for the application of these devices in new experiments in the next few years.

17578 **Design window for liquid metal-cooled limiters.** Majid, A.; Abdou, M. (Mechanical, Aerospace and Nuclear Engineering Dept., Univ. of California, Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 776-781(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A design window for a liquid metal cooled limiter is being sought to establish the viability of the use of liquid metals as coolants for the limiter. The problem is approached by first establishing the constraints, then defining the geometrical configuration and design parameters, and finally, by analyzing a limiter without coating. The maximum allowable heat flux is found to be — 4 MW/m/sup 2/. It can be increased to 5 MW/m/sup 2/ if tapered or insulated feed pipes are used. The presence of coatings required to withstand particle erosion will further reduce the allowable heat flux.

17579 **Fusion surface material melting, ablation and ejection under high heat loading.** Holliday, M.R.; Doster, J.M.; Gilligan, J.G. (Center for Naval Analysis, Alexandria, VA). *Fusion Technology;* **10**: No. 3, 782-788(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Heat Balance Integral Technique is developed to solve for the surface melting and ablation rates when a material is subjected to a high heat flux. Ejection of melt layer material is included in the analysis since external forces (electric and magnetic) are prominent for applications such as fusion plasma disruptions. The Integral Technique has been found to be relatively fast and accurate as compared with finite difference formulations which make it an ideal candidate for inclusion in larger plasma simulation codes. Molten material ejection was determined to dramatically increase surface erosion during a fusion disruption.

17580 **Thermodynamic performance of ceramic tritium breeding blanket material.** Johnson, C.E.; Fischer, A.K. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 985-989(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Thermodynamic calculations are made to compare the thermochemical performance of three candidate breeder blanket materials, Li/sub 2/O, LiAl0/sub 2/, and Li/sub 4/SiO/sub 4/. These calculations are done for the temperature range of 900-1300 K and the oxygen activity range of 10/sup -25/ to 10/sup -5/. Oxygen activity is an influential variable for these materials and must be considered in the diffusion of tritiated species, determining the chemical form of the released tritium, and retention of tritium in the condensed phase. Surface adsorption may also act as a strong contributor to tritium inventory. In general, LiAl0/sub 2/ appears better than Li/sub 2/O and Li/sub 2/O, in turn, appears better than Li/sub 4/SiO/sub 4/.

17581 **The chemistry of molten Li/sub 2/BeF/sub 4/.** Larsen, E.M.; Wittenberg, L.J. (Univ. of Wisconsin, Fusion Technology Institute, Nuclear Engineering Dept., 1500 Johnson Drive, Madison, WI 53706-1687). *Fusion Technology;* **10**: No. 3, 990-994(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The LiF . BeF/sub 2/ system is a potential tritium breeder for a fusion power reactor. The chemical consequences of the TF(HF) generation are examined, particularly reactions proposed for moderating the corrosive properties of TF(HF). The use of molten Li/sub 2/BeF/sub 4/ as a tritium breeding blanket was considered by Grimes and Cantor in 1972. Renewed interest in LiF . BeF/sub 2/ compositions as tritium breeding blankets for MINIMARS (a conceptual design study of a commercial tandem mirror fusion reactor), suggests that a review of the chemical and physical properties of this system is appropriate at this time. A large fraction of the data presented here is derived from the publications of the molten salt breeder (fission) reactor program which prospered at Oak Ridge National Laboratories during the late 1960's and early 1970's. The predictions of chemical reactivity are based on the thermochemical data at 1000 K.

17582 **First wall tile attachment using carbon-carbon composite fittings.** Lutz, G.R.; Tarasen, W.L. (One Space Park, Redondo Beach, CA 90278). *Fusion Technology;* **10**: No. 3, 1000-1005(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

This paper presents unique first wall tile attachment concepts of round or square graphite tiles to an Inconel 625 vacuum vessel (VV) with carbon-carbon (c-c) structural/mechanical elements to satisfy the following objectives: 1. a low profile installation to optimize field efficiency; 2. tile alignment of sufficient precision to fully protect the VV, without adverse interference of the plasma; 3. adequate structural capacity to safely accommodate normal static and dynamic loads as well as disruption and handling loads; 4. a tile and tile shank-to-VV wall stud mechanical interface that provides an acceptable level of conductive heat transfer while accommodating freedom of thermal expansion and contraction; 5. a minimum irradiated life expectancy of 3,000 operating pulses; and 6. a reliable and repeatable method of replacing first wall tiles by means of a conventional remote manipulator device.

17583 **In-vacuum cyclic fatigue behavior of Vanstar-7 at elevated temperatures.** Liu, K.C. (Oak Ridge National Lab., Metals and Ceramics Div., Oak Ridge, TN 37831). *Fusion Technology;* **10**: No. 3, 1006-1014(Nov 1986). (CONF-860652—). Contract AC05-84OR21400.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Unirradiated Vanstar-7 alloy was tested in fatigue at room temperature, 550°, and 650°C, respectively, in high vacuum below 10/sup -5/ Pa. The test data are analyzed and compared with those of V-15Cr-5Ti and 20% cold-worked type 316 stainless steel tested under the same condition. Results show that the fatigue resistance of Vanstar-7 is in general somewhat lower than that of V-15Cr-5Ti. The low fatigue performance for Vanstar-7 at the elevated temperatures in the high cycle range may be attributable to thermal creep damages because Vanstar-7 is less creep resistant than V-15Cr-5Ti. However, Vanstar-7 exhibits superior fatigue resistance compared with the stainless steel in the low strain range below 0.5% strain.

17584 **Experimental modelling of eddy currents and deflection for tokamak limiters.** Hua, T.Q.; Knott, M.J.; Turner, L.R.; Wehrle, R.B. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 1047-1052(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

During plasma disruptions in a tokamak fusion reactor, eddy currents are induced in the limiters and other conducting structures surrounding the plasma. Interactions between these currents with the toroidal field causes deflection and stress in the structural components. The structural motion in the strong magnetic field induces additional eddy current opposing the initial eddy current and modifying subsequent structural dynamics. Therefore, the motion and current are coupled and must be solved simultaneously. The coupling between current and deflection in cantilevered beams was investigated experimentally. The beams provide a simple model for the limiter blade of a tokamak fusion reactor. Several test pieces and various magnetic field conditions were employed to study the extend of the coupling effect from weak to strong coupling. Experimental results are compared with analytical predictions.

17585 **Conference on thermonuclear reactors.** *Fusion Technology;* **10**: No. 3, 1652(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

This conference presents papers on the design, construction and performance of thermonuclear reactors. Topics considered at the conference included the Compact Ignition Tokamak program, fusion nucleonics experiments, blanket design and evaluation, inertial confinement fusion driver technology, fusion reactor design,

fusion materials (radiation effects and activation), impurity control, liquid metal blankets and magnetohydrodynamic effects, innovative concepts for power conversion, plasma heating, environmental and safety aspects, inertial confinement fusion targets, fusion applications, tritium technology, and fusion economics.

17586 **Demountable toroidal fusion core facility for toroidal physics optimization and fusion engineering research.** Bogart, S.L.; Wagner, C.E.; Krall, N.A.; Sedehi, S.; Weggel, C.F.; Dalessandro, J.A.; Seed, T.J.; Lund, K.O. (EASI, 1104 Camino Del Mar, Del Mar, CA 92014). *Fusion Technology;* **10**: No. 3, 1404-1411(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Demountable Toroidal Fusion Core (DTFC) concept has been analyzed for the Inductively Heated Tokamak (IHT), the Spherical Tokamak (ST), and the Reversed Field Pinch (RFP) for Fusion Engineering Research Facility (FERF) applications. Each of these confinement concepts is viewed as a "core" that is inserted into a surrounding machine envelope including, for example, the outboard toroidal field coil turns, the major poloidal equilibrium coils, blanket and materials testing stations, and a tension-suppression system (precompression) that provides mechanical integrity during the ignition and burn phases. Parametric systems analysis reveals that DTFC FERF operation is possible for all three confinement configurations with the IHT being the most costly and technologically challenging and the RFP being the least costly and, perhaps, least technologically challenging. Future work on the DTFC will be directed toward a Toroidal Physics Optimization Facility.

17587 **Deuterium driven D - T fusion reactor test facility.** Price, R.E.; Shuy, G.W.; Woo, J.T. (U.S. Dept. of Energy, Washington, DC 20545). *Fusion Technology;* **10**: No. 3, 1412-1417(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

In the present scenario for the development of magnetic confinement fusion, the availability of tritium needed to fuel a D-T burning plasma in order to generate 14 MeV neutrons for material and system component testing is not being fully addressed. An alternate approach based on the in situ generation of tritium in a driven D-D reacting plasma is proposed. The feasibility of this approach to attain 14 MeV neutron flux levels comparable with D-T fueled burning plasma from a modest beta, first generation fusion power reactor can be established from known results. A staged scenario, is described in which tritium bred from developmental blankets is used to fuel the system to incrementally raise the neutron wall loading to simulate more advanced fusion reactors.

17588 **Heavy-ion fusion: Future promise and future directions.** Dudziak, D.J.; Saylor, W.W.; Pendergrass, J.H. (Univ. of California, Los Alamos National Lab., P.O. Box 1663, Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 1438-1442(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The previous several papers in this heavy-ion fusion special session have described work that has taken place as part of the Heavy-Ion Fusion Systems Assessment (HIFSA) project. Key technical issues in the design and costing of targets, accelerator systems, beam transport, reactor and balance-of-plant, and systems integration have been identified and described. The HIFSA systems model was used to measure the relative value of improvements in physics understanding and technology developments in many different areas. The result of this study has been to, within the limits of our 1986 imagination and creativity, define the "most attractive" future heavy-ion fusion (HIF) power plant at some time in the future (beyond the year 2020 in this case). The project has specifically avoided narrowing the focus to a point facility design; thus, the generic systems modeling capability developed in the process allows for a relative comparison among design options. The authors describe what are thought to be achievable breakthroughs and what the relative significance of the breakthroughs will be, although the specific mechanism for achieving some breakthroughs may not be clear at this point.

17589 **U.S./JAERI calculational benchmarks for nuclear data and codes intercomparison.** Youssef, M.; Jung, J.; Sawan, M.; Nakagawa, M.; Mori, T.; Kosako, K. (Mechanical, Aerospace and Nuclear Engineering, Univ. of California at Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1466-1476(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Four calculational benchmarks were selected by the U.S. and JAERI to compare numerical results based on various transport codes and data bases developed individually by both parties. The benchmarks chosen are fusion-oriented. Data intercomparison were performed with the ENDF/B-IV, ENDF/B-V, and JENDL-3 evaluations. Both deterministic and Monte Carlo methods were used in the codes intercomparison. Among the codes considered are ONEDANT, ANISN-DD, DOT, MORSE, MCNP, and VIM. Results from these intercomparisons are presented in this paper.

17590 **A standard method for economic analyses of inertial confinement fusion power plants.** Meier, W.R. (Lawrence Livermore National Lab., P.O. Box 5508, L-480, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 1557-1564(Nov 1986). (CONF-860652—). Contract W-7405-ENG-48.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A standard method for calculating the total capital cost and the cost of electricity for a typical inertial confinement fusion electric power plant has been developed. A standard code of accounts at the two-digit level is given for the factors making up the total capital cost of the power plant. Equations are given for calculating the indirect capital costs, the project contingency, and the time-related costs. Expressions for calculating the fixed charge rate, which is necessary to determine the cost of electricity, are also described. Default parameters are given to define a reference case for comparative economic analyses.

17591 **SAFIRE - A systems analysis code for inertial fusion economics.** McCarville, T.J.; Carson, C.F.; Glasgow, B.B.; Meier, W.R. (TRW, One Space Park, Redondo Beach, CA 90278). *Fusion Technology;* **10**: No. 3, 1565-1570(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A system model for scaling the cost and performance of ICF point designs to different operating conditions has been developed. The model allows changes in various figures of merit to be examined as a function of selected operating conditions. As a result, $/kW/sub e/ can be optimized as a function of net electric output. A detailed description of the algorithms/sup 1/ and users guide/sup 2/ can be obtained through LLNL. This report provides an overview of the philosophy that motivated the performance and cost models, and illustrates the model results with an example.

17592 **Economic comparison of fusion power plant designs.** O'Neill, J.E. (Grumman Aerospace Corp., Bethpage, NY 11714). *Fusion Technology;* **10**: No. 3, 1571-1576(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Cost estimates derived in fusion power plant design studies over the past 10 years are normalized to a common base and compared. It is found that direct costs tend with time toward $1,000/kW/sub e/ and cost of electricity toward 30 mills/kWh, for all reactor types. Costs are in 1980 dollars. Only small reductions in cost are indicated as core mass density increases beyond a value of approximately 100 kW/sub e//Tonne.

17593 **Three-state model for fusion reactor plant availability analysis.** Watanabe, Y.; Maynard, C.W.; Musicki, Z. (Fusion Technology Institute, Univ. of Wisconsin, 1500 Johnson Drive, Madison, WI 53706-1687). *Fusion Technology;* **10**: No. 3, 1590-1595(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

An availability simulation methodology and a computer program (PROPA) have been developed for systems subject to three

states: normal, degraded, and failed. The program is used to analyze the STARFIRE tokamak fusion reactor plant. The new program extends our modeling capability for complex systems; while it is found that significant improvements are needed in the areas of reliability data, understanding of system behavior, and the computing speed.

17594 **Neutronics analysis for aqueous self-cooled fusion reactor blankets.** Embrechts, M.J.; Varsamis, G.; Jaffa, R.; Steiner, D.; Deutsch, L.; Gierszewski, P. (Rensselaer Polytechnic Institute, Troy, NY 12180). *Fusion Technology;* **10**: No. 3, 1443-1448(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The tritium breeding performance of several Aqueous Self-Cooled Blanket (ASCB) configurations for fusion reactors has been evaluated. The ASCB concept employs small amounts of lithium compound dissolved in light or heavy water to serve as both coolant and breeding medium. The inherent simplicity of this concept allows the development of blankets with minimal technological risk. The tritium breeding performance of the ASCB concept is a critical issue for this family of blankets. Contrary to conventional blanket designs there will be a significant contribution to the tritium breeding ratio (TBR) in the water coolant/breeder of duct shields, and the 3-D TBR will therefore be similar to the 1-D TBR. The tritium breeding performance of an ASCB for a MARS-like tandem mirror reactor and an ASCB based breeding-shield for the Next European Torus (NET) are assessed. Two design options for the MARS-like blanket are discussed. One design employs a vanadium first wall, and zircaloy for the structural material. The trade-offs between light water and heavy water cooling options for this zircaloy blanket are discussed. The second design option for MARS relies on the use of a vanadium alloy as the structural material, and heavy water as the coolant. It is demonstrated that both design options lead to low-activation blankets that allow class C burial. The breeder-shield for NET consists of a water-cooled stainless steel shield.

17595 **Trade-off study of liquid metal self-cooled blankets.** Gohar, Y. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 1449-1455(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A trade-off study of liquid metal self-cooled blankets was carried out to define the performance of these blankets and to determine the potential to operate at the maximum possible values of the performance parameters. The main parameters considered during the course of this study were the tritium breeding ratio (TBR), the blanket energy multiplication factor, the energy fraction lost to the shield, the lithium-6 enrichment in the breeder material, the total blanket thickness, the reflector material selection, and the compositions of the different blanket zones. The primary results of the study are as follows: a) the lithium-lead blanket achieves a higher TBR with a smaller blanket thickness relative to the lithium blanket; b) the lithium blanket generates more energy per fusion neutron relative to the lithium-lead blanket; c) among the possible reflector materials, the carbon reflector produces the highest TBR; d) the high-Z reflector materials (Mo, Cu, W, or steel) generate more energy per fusion neutron and produce smaller TBRs relative to the carbon reflector; e) lithium-6 enrichment is required for the lithium-lead blanket to reduce the total blanket thickness; and f) the energy deposition per fusion neutron reaches a saturation as the blanket thickness, the fraction of the high-Z material in the reflector, or the reflector zone thickness increases (this allows one to design the blanket for a specific TBR without reducing the energy production).

17596 **A thin LiPb/Be helium cooled blanket for MINI-MARS: Neutronics analysis.** El-Guebaly, L.A. (Univ. of Wisconsin, Fusion Technology Institute, Nuclear Engineering Dept., 1500 Johnson Drive, Madison, WI 53706-1687). *Fusion Technology;* **10**: No. 3, 1456-1460(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The need for a thin blanket design in fusion reactor provides a driving force to improve the performance of a LiPb-type blanket through adding a moderator to the breeder to soften the neutron spectrum and, thus, enhance the tritium breeding. As a result, the LiPb blanket performed much better with a beryllium moderator and the design of a 0.17 m thick blanket has become feasible.

17597 **Geometrical, spectral and temporal differences between ICF and MCF reactors and their impact on blanket nuclear parameters.** Sawan, M.E. (Univ. of Wisconsin, Nuclear Engineering Dept., Fusion Technology Institute, 1500 Johnson Drive, Madison, WI 53706-1687). *Fusion Technology;* **10**: No. 3, 1483-1488(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Geometrical and spectral differences between inertial confinement fusion (ICF) and magnetic confinement fusion (MCF) facilities lead to significant variation of up to — 60% in peak values and profiles of the time averaged blanket nuclear parameters for the same first wall exposure. Simple scaling of radiation effects with neutron wall loading is inappropriate. These effects together with the temporal effects, that result in — 5 to 8 orders of magnitude higher instantaneous reaction rates in the pulsed ICF reactors, lead to significantly different blanket performances in the ICF and MCF reactor environments.

17598 **Activation analysis of the Compact Ignition Tokamak.** Selcow, E.C. (Fusion Engineering Design Center/Grumman Corp., P.O. Box Y, Oak Ridge, TN 37831). *Fusion Technology;* **10**: No. 3, 1495-1502(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The U.S. fusion program has completed the conceptual design of a compact tokamak device that achieves ignition. The high neutron wall loadings associated with this compact deuterium-tritium-burning device indicate that radiation-related issues may be significant considerations in the overall system design. Sufficient shielding will be required for the radiation protection of both reactor components and personnel. A close-in igloo shield has been designed around the periphery of the tokamak structure to permit personnel access into the test cell after shutdown and limit the total activation of the test cell components. This paper describes the conceptual design of the igloo shield system and discusses the major neutronic concerns related to the design of the Compact Ignition Tokamak.

17599 **Cost study of the ESPRESSO blanket for a tandem mirror reactor.** Raffray, A.R.; Hoffman, M.A.; Gaskins, T. (Mechanical, Aerospace and Nuclear Engineering Dept., Univ. of California, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1577-1582(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A detailed cost study of the ESPRESSO blanket concept for the Tandem Mirror Fusion Reactor has been performed. A computer code was developed to size the magnet, blanket and piping components and to evaluate the central cell contribution to the cost of electricity. The two most promising solid breeder/neutron multiplier configurations were studied: natural lithium oxide as the breeder with no multiplier (Case I), and 30% enriched gamma-lithium aluminate as the breeder with beryllium as the multiplier (Case IV). A design window was obtained for each case based on maximum material temperatures and spacing constraints. The minimum cost designs for Case I and Case IV correspond to 31 and 41 mills/kW-hr for the central cell contribution to the cost of electricity, and to optimum neutron wall loadings of 2.3 and 3.4 MW/m/sup 2/, respectively.

17600 **First wall structural analysis of the aqueous self-cooled blanket concept.** O'Brien, D.A.; Steiner, D.; Embrechts, M.J.; Deutch, L.; Gierszewski, P. (Rensselaer Polytechnic Institute, Troy, NY 12181). *Fusion Technology;* **10**: No. 3, 1611-1616(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A recently proposed blanket concept using water coolant with dissolved lithium compounds for breeding employs water cooled first walls. Water cooled first walls for blankets have also been proposed for some solid breeder blankets. Design options for water cooled first walls are examined in this paper. Four geometries and three materials are analyzed for water coolant at 300°C and 13.8 MPa (2000 psi). Maximum neutron wall loads (with surface heat loads being 25% of neutron wall load) are determined for each geometry and material combination. Of the materials studied, only vanadium alloy is found to be capable of withstanding high wall loads (>10MW/m/sup 2/ neutron and >2.5 MW/m/sup 2/ heat).

17601 **A model for the mechanical interaction between solid breeder and cladding materials.** Orient, G.E.; Ghoniem, N.M. (Mechanical Aerospace and Nuclear Engineering Dept., Univ. of California Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1617-1622(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Mechanical interaction between the solid breeder material and its cladding during power cycles is an important consideration in the design of solid breeder blankets. The analysis presented in the paper gives a design tool for material choices and lifetime prediction for breeder pins. The UCLA solid breeder blanket design is evaluated, and operating conditions are suggested. The material model for the pellet includes linear thermoelastic behavior and swelling. The cladding is assumed to be thin and to exhibit swelling and creep. Two alternate breeder/cladding material pairs have been analyzed, a Li/sub 2/O/2.25Cr-lMo and a LiAlO/sub 2//9-C design. While high swelling excludes the Li/sub 2/O/2.25Cr-lMo design, it is found that in the LiAlO/sub 2//9-C case compatibility of thermal expansion between the breeder and the cladding as well as low swelling of the breeder result in less than 0.5% total plastic strain after one year of operation.

17602 **The bowing of solid breeder rods in a pin-type fusion reactor.** Blanchard, J.P.; Ghoniem, N.M. (Univ. of California at Los Angeles, Los Angeles, CA 90025). *Fusion Technology;* **10**: No. 3, 1623-1627(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The bowing of circular solid breeder pins is studied using standard beam theory. Deformations caused by thermal gradients, swelling gradients, and gravitational forces are included in the investigation and swelling is found to cause the most severe pin bowing. The bowing of Be multiplier rods is found to be insignificant when swelling is not considered. In all cases it is found that adding internal supports can reduce the rod deflections to acceptable levels without increasing the stresses beyond design limits.

17603 **Steady-state and transient thermal hydraulics of a breeder-in-tube blanket design.** Grotz, S.P.; Ghoniem, N.M. (Mechanical, Aerospace and Nuclear Engineering Dept., Univ. of California, Los Angeles, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1628-1633(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A new pin-type solid breeder blanket for tokamak reactors has been developed. Detailed engineering analyses have been performed and include configuration, neutronics, structural analysis, tritium transport, materials issues and thermal hydraulics. Steady-state and transient thermal problems have been addressed and are reported. Particular attention is given to the issues of start-up, shutdown and fractional power operation. This study complements a previous report which examined the start-up, shutdown and fractional power operation of a liquid metal cooled tandem mirror reactor blanket.

17604 **Neutronic optimization of a LiAlO/sub 2/ solid breeder blanket.** Levin, P.; Ghoniem, N.M. (Physics Dept., Nuclear Research Center-Negev, P.O. Box 9001, Beer Sheva 84191). *Fusion Technology;* **10**: No. 3, 1634-1639(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

In this paper, a pressurized lobular blanket configuration is neutronically optimized. The blanket configuration features the use of beryllium and LiAlO/sub 2/ solid breeder pins in a helium-cooled cross-flow pattern. One-dimensional neutronic optimization calculations are performed to maximize the tritium breeding ratio (TBR). The procedure involves spatial allocations of Be, LiAlO/sub 2/, 9-C (low-activation ferritic steel), and He, in such a way as to maximize the TBR subject to several material, engineering and geometrical constraints. Consistent with all imposed engineering constraints, a TBR of 1.17 is achieved for a relatively thin blanket (≅43 cm depth).

17605 **Thermal-hydraulic study of the ESPRESSO blanket for a Tandem Mirror Reactor.** Raffray, A.R.; Hoffman, M.A. (Mechanical, Aerospace and Nuclear Engineering Dept., Univ. of California, Los Angeles, CA 90024). *Fusion Technology;* **10**: No. 3, 1640-1645(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A thermal-hydraulic design study of the proposed ESPRESSO blanket for the Tandem Mirror Fusion Reactor is presented. Two solid breeder/multiplier configurations have been selected for the study: one with natural Li/sub 2/O as solid breeder and no neutron multiplier and the other with 30% enriched gamma-LiAlO/sub 2/ as solid breeder and Be as multiplier. A systematic procedure has been developed which effectively reduces the number of independent parameters to two, namely the neutron first wall loading and the main flow bulk temperature rise. Their effect on the maximum multiplier and breeder temperatures and on the pumping power ratio is investigated. Maximum allowable breeder and multiplier temperature constraints limit the design choice and a design point has been obtained for each case for a given maximum allowable pumping power ratio.

17606 **High field superconducting magnets (12 T and greater) for fusion applications.** Miller, J.R.; Summers, L.T.; Kerns, J.A. (Lawrence Livermore National Lab., Univ. of California, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 1503-1512(Nov 1986). (CONF-860652—). Contract W-7405-ENG-48.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The technology for producing high fields in large superconducting magnets has increased greatly in recent years, but must increase still more in the future. In this paper, the authors examine the present state of the art vis-a-vis the needs of a next-generation fusion machine and outline a program to provide for those needs. They also highlight recent developments that suggest the program goals are within reach.

17607 **MINIMARS choke coil design.** Gurol, H.; Parmer, J.F.; Burgeson, J.E.; Peck, S.D.; Hilal, M.A.; Mancuso, T.A.; Agarwal, K.L.; Dalder, E.N. (General Dynamics Space Systems Div., Mail Zone 92-7100, P.O. Box 85990, San Diego, CA 92138). *Fusion Technology;* **10**: No. 3, 1524-1529(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The purpose of this paper is to discuss the 24 Tesla MINIMARS choke coil configuration. It is a hybrid design consisting of a superconducting background coil and a normal-conducting insert coil. Recent technology advances, use of superalloy reinforcement materials, and current density grading allow the design of coils that are more compact and operate at higher fields than past designs.

17608 **Sliding joint and bond development program for the Alcator C-Mod toroidal field coils.** Beck, W.K.; Becker, H.D.; Besen, M.M.; Gwinn, D.A.; Montgomery, D.B.; Pierce, N.T.; Pillsbury, R.D.; Schultz, J.H. (Plasma Fusion Center, Massachusetts Institute of Technology, NW17-225, Cambridge, MA 02139). *Fusion Technology;* **10**: No. 3, 1536-1541(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Alcator C-Mod toroidal field (TF) magnets include several advanced magnet concepts that are planned or considered for a compact ignition tokamak experiment (C.I.T). Two concepts in particular, sliding joints and explosively-bonded composite plates, require a development program to assure feasibility and performance.

17609 **The differential geometry of twisted coil windings.** Walstrom, P.L. (Univ. of Wisconsin, Nuclear Engineering Dept., Fusion Technology Institute, 1500 Johnson Drive, Madison, WI 53706-1687). *Fusion Technology;* **10**: No. 3, 1542-1547(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The techniques of differential geometry have been applied to the problem of predicting the shape of thick twisted coil windings as successive turns and layers of turns are applied to a winding form. The explicit expressions for the required Christoffel symbols for parallel surfaces are derived in terms of the starting surface parameterization. Expressions for geodesic windings on a particular surface, called the rectifying developable, and the family of surfaces parallel to it are derived. The advantages of the rectifying developable from the point of view of coil fabrication are discussed.

17610 **Stability and vibration of internal windings of superconducting solenoid magnets.** Hara, K.; Moon, F.C. (T.J. Watson Research Center, P.O. Box 218, Yorktown Heights, NY 10598). *Fusion Technology;* **10**: No. 3, 1548-1556(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Superconducting magnets have complex structures. The coil pack is made up of alternate layers of superconductor and insulator, which form an extremely unisotropic composite structure. For example, the MFTF magnet design, the transverse stiffness is quite soft as compared to the circumferential stiffness. In this study, cylindrically wound superconducting magnets were modeled by two-dimensional multi-rings connected by soft springs, and the internal vibration and buckling of the system were studied both experimentally and analytically. Since the linear elastic theory used in the previous studies has failed to predict buckling and vibration of internal turns in the bending mode, elastic ring theory was used in this study. A model based on ring theory and magnet stiffness was developed to explain experimental observations and showed a fair to good agreement between experimental and theoretical values of the buckling current.

17611 **The tritium system for a tokamak with a self-pumped limiter.** Hassanein, A.M.; Sze, D.K. (Argonne National Lab., 9700 South Cass Avenue, FPP-205, Argonne, IL 60439-4837). *Fusion Technology;* **10**: No. 3, 1355-1361(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The self-pumping concept was proposed as a means of simplifying the impurity control system in a fusion reactor. The idea is to remove helium in-situ by trapping in freshly deposited metal surface layers of a limiter or divertor. Trapping material is added to the plasma scrape-off or edge region where it is transported to the wall. Some of the key issues for this concept are the tritium inventory in the trapping material and the permeation of protium and recycling of tritium. These quantities are shown to be acceptable for the reference design. The tritium issues for a helium-cooled solid breeder reactor design with vanadium alloy as a structural material are also examined. Models are presented for tritium permeation and inventory calculation for structure materials with the effect of a thin layer of coating material.

17612 **A process to recover tritium from high pressure helium.** Finn, P.A.; Sze, D.K. (Argonne National Lab., 9700 South Cass Avenue, Argonne, IL 60439). *Fusion Technology;* **10**: No. 3, 1362-1366(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A liquid metal absorption system is proposed as a recovery technique for recovering tritium from high pressure helium. The helium and liquid lithium are mixed to effect transfer of the tritium from the gas to the liquid lithium. Subsequently, the lithium is processed using molten salt extraction. The advantages and disadvantages of this method are compared with other methods. Overall, the liquid metal method appears to be one with significant potential.

17613 **Water detritiation for present and future fusion plants.** Rogers, M.L. (Monsanto Research Corp., Mound, Miamisburg, OH 45342). *Fusion Technology;* **10**: No. 3, 1367-1374(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

All fusion reactors that use deuterium-tritide (DT) for fuel will produce tritium-containing water. The quantity and quality (tritium per unit volume) of tritiated water produced depends on several factors. In general, however, the higher the reactor availability the greater the quantity and quality of water produced. This water must be collected and processed to avoid worker exposure and release to the environment. The options for disposition of this water are limited, and in more advanced reactors the tritium contained in water could represent a significant loss to the fuel cycle. The technology currently exists or is being developed to support near term, low availability machines. The technology to support more advanced concepts must be identified and further developed so that it is available when needed.

17614 **Data base for failure/maintenance at the Tritium Systems Test Assembly.** Gruetzmacher, K.M.; Wilhelm, R.C. (Fusion Technology Institute, Univ. of Wisconsin, 1500 Johnson Dr., Madison, WI 53706). *Fusion Technology;* **10**: No. 3, 1596-1604(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A data collection system for obtaining availability/reliability data on fusion technology has been installed at the Tritium Systems Test Assembly (TSTA) of Los Alamos National Laboratory. The system is fashioned after the Centralized Reliability Data Organization developed at Oak Ridge National Laboratory. The data collection system is currently being used at TSTA and is working well. The amount of data that has been collected at TSTA to date is not sufficient to indicate meaningful trends in availability analysis.

17615 **Heavy-ion fusion: Setting the stage.** Herrmannsfeldt, W.B. (Stanford Linear Accelerator Center, Stanford Univ., P.O. Box 4349, Stanford, CA 94305). *Fusion Technology;* **10**: No. 3, 1423(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The purpose of this paper is to establish the context on which the rest of this session will be based. Several papers will report work inspired by the Heavy-Ion Fusion Systems Assessment (HIFSA) Project. This is a small project that is about 2 years old. It is a small fraction of the Heavy-Ion Fusion (HIF) Program, which is itself very small compared to virtually any other fusion effort. Certainly, part of the basis for HIFSA lies in the history of HIF. The program was invented in high-energy physics accelerator laboratories in about 1975. In the past decade, work at several U.S. laboratories and universities, and in Japan and Europe, has resulted in fundamental understanding of the phenomena involved in the stable transport and acceleration of space charge limited beams. HIF is the approach that is, more than any other, most suited to the high energy (multi-megajoule), high repetition rate, and high efficiency required of a power plant driver. There have been seven international conferences devoted to HIF (most recently in May 1986) and numerous independent reviews. All of these confirm the promise of HIF for eventual use for commercial power production. Perhaps the best overall systems study for inertial fusion to date, certainly the best for HIF, is the HIBAll-II study. In this study, the

authors arrive at a power plant scenario in which they project a cost of electricity that is somewhat lower than that found for various magnetic fusion scenarios. Certainly it is competitive with magnetic fusion.

17616 **A comparison of the design and costs of induction LINAC drivers for inertial fusion using ions of mass 133 and 200.** Hovingh, J.; Brady, V.O.; Faltens, A.; Lee, E.P. (Lawrence Livermore National Lab., Box 808, Livermore, CA 94550). *Fusion Technology;* **10**: No. 3, 1424-1426(Nov 1986). (CONF-860652—). Contract AC03-76SF00098.

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Optimized cost estimates for induction linac accelerators using mass 133 ions at a charge state of +2 producing inertial fusion target yields of 300, 600, and 1200 MJ are presented. The ions are injected into the accelerator at 3 MV, and accelerated to the required voltage appropriate to the desired target yield. A cost comparison of these drivers is made with drivers using mass 200, charge state +3 ions for several target yields and a fusion power of 3000 MW.

17617 **Gain scaling relations for heavy-ion targets.** Magelssen, G.R. (Los Alamos National Lab., Group X-1, Mail Stop E531, Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 1427-1428(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The relationship between target gain (thermonuclear energy-released/ion energy incident) and such factors as the total ion energy, the ion beam radius, the ion range, the ion power, the beam geometry, and the released target debris is critical in assessing the feasibility of a particular heavy ion inertial confinement fusion reactor concept. The length of the heavy ion accelerator will depend strongly on the ion particle energy - the ion range. The beam focus and transport both depend on the ion particle energy as does the efficiency of coupling ion energy to the target fuel. Target symmetry requirements determine whether the ion beams are clustered in two arrays for two-sided target illumination or in a symmetric configuration for multisided uniform illumination. The amount of debris energy in charged particles and x-rays impacts chamber design and determines wall loading constraints. The purpose of this paper is to present gain scaling relations that incorporate most of the critical factors.

17618 **Reactor designs for heavy-ion fusion.** Pendergrass, J.H.; Meier, W.R. (Los Alamos National Lab., P.O. Box 1663, Mail Stop F611, Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 1431-1432(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The Heavy-Ion Fusion Systems Assessment (HIFSA) Project is a study of the prospects for successful pure fusion commercial HIF electric power generation using heavy-ion induction linear accelerator (linac) drivers. Although the project is led by Los Alamos National Laboratory (LANL), success requires substantial contributions from all members of a large interdisciplinary team representing a unique assemblage of talent from other national laboratories, universities, and industry. Recognition that many of the dozens of inertial confinement fusion reactor and balance-of-plant (BOP) concepts developed for laser fusion require only minor modifications for use with induction linac drivers, plus the existence of several concepts developed especially for HIF, led to concentration of limited HIFSA resources on target, accelerator, and integrated-plant issues.

17619 **Heavy ion beam transport in ICF reaction chambers.** Stroud, P. (Univ. of California, Los Alamos National Lab., P.O. Box 1663, Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 1433-1434(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

An analysis has been performed to determine the technological requirements for transporting a beam of heavy ions across an ICF reaction chamber. This is a crucial issue because excessive beam expansion will reduce the driver energy deposited on the target, and degrade the performance of the reactor system. The physical mechanisms that dominate beam expansion for heavy ion fusion applications include emittance growth, instabilities, parallel momentum spread, and space charge. These mechanisms place technological constraints on such system parameters as beam voltage, beam power, number of beams, beam mass and charge state, final transport length, beam port radius, target radius, beam emittance, momentum tilt, and background chamber gas density. The economic analysis of a heavy ion ICF reactor system requires a thorough understanding of the trade-offs among these parameters imposed by the beam expansion mechanisms.

17620 **A systems performance and cost model for heavy ion fusion.** Zuckerman, D.S.; Driemeyer, D.E.; Waganer, L.M. (McDonnell Douglas Astronautics Co., P.O. Box 513, St. Louis, MO 63166). *Fusion Technology;* **10**: No. 3, 1435-1436(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

As a part of the DOE-sponsored Heavy Ion Fusion Systems Assessment (HIFSA) project, a systems and costing computer model has been developed to examine the behavior of a linear induction accelerator-driven (LINAC) HIF power plant. The main purpose of this code is to examine different system and subsystem options as well as a large range of parameter space in which an HIF power plant might operate. The ultimate goals include the identification of: (1) desirable operating regimes, (2) preferred system and subsystem options, (3) systems with major cost impacts, and (4) systems where appropriate research and development or technological breakthroughs could yield significant economic benefits.

17621 **Heavy ion fusion systems assessment - An overview.** Waganer, L.M.; Driemeyer, D.E.; Zuckerman, D.S.; Billman, K.W. (McDonnell Douglas Astronautics Co., P.O. Box 516, St. Louis, MO 63166). *Fusion Technology;* **10**: No. 3, 1437(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

A study is underway to evaluate the technical performance and economic attractiveness of linear induction-driven Heavy Ion Fusion (HIF) as an energy source for electrical power generation. This study is a cooperative effort of several national laboratories, universities, industrial contractors and the Electric Power Research Institute (EPRI) under the leadership of Los Alamos National Laboratory. McDonnell Douglas Astronautics Company, assisted by Titan Systems, Inc, has the responsibility to integrate the cost and performance models of the driver, reactor and balance of plant systems, evaluate different system options and assess the overall technical and economic performance of an HIF power plant. Individual system options have been designed and analyzed by the other participants in the DOE-sponsored parent study and are provided for system integration and evaluation. This paper describes the integration and evaluation effort for the HIF Systems Assessment. Specific areas discussed include, the definition of Systems Requirements, the development of Assessment Methodology, the characterization of System Options, the description of Systems Assessment Code, the assessment of Code Results, the ranking of System Options, the selection of Attractive System Options, and the determination of Preferred Operating Parameter Space. The initial study effort was to define the system requirements from the standpoint of the overall power plant. This was accomplished by establishing overall power plant performance goals and specifications. The plant was assumed to be dedicated only to electrical power production in the 2020 time frame enabling the study to look beyond developmental and startup difficulties. The net plant output was defined to be between 400 and 1500 MWe which would allow investigating the effect of plant size.

17622 **COVFILS-2: Neutron data and covariances for sensitivity and uncertainty analysis.** Muir, D.W. (Los Alamos National Lab., Applied Nuclear Science Group, Mail Stop B243, Los Alamos, NM 87545). *Fusion Technology;* **10**: No. 3, 1461-1465(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

The authors have prepared a new, fusion-oriented library of multigroup neutron cross sections, scattering matrices, and covariances (uncertainties and correlations) using modules of the NJOY nuclear data processing system. This 74-group library, called COVFILS-2, was produced specifically for use in the sensitivity and uncertainty analysis of fusion-relevant integral experiments. The 14 materials included in the first version of COVFILS-2 are H, /sup 6/Li, /sup 7/Li, Be, C, N, O, Na, Al, Si, Cr, Fe, Ni, and Pb.

17623 **Fast and intermediate energy neutron albedos for fusion materials.** Micklich, B.J. (Dept. of Nuclear Engineering, Univ. of Illinois at Urbana-Champaign, 103 S. Goodwin Avenue, Urbana, IL 61801). *Fusion Technology;* **10**: No. 3, 1477-1482(Nov 1986). (CONF-860652—).

From 7. topical meeting on the technology of fusion energy; Reno, NV, USA (15 Jun 1986).

Neutron albedo methods can be used to simplify transport calculations in a wide variety of applications. Their utilization requires a collection of albedo data and a model which makes these results convenient for hand or machine computation. Results are presented from neutron albedo calculations for incident intermediate-energy neutrons. These results can be explained using our knowledge of neutron interaction physics. Total albedos are directly related to the cross sections for elastic scatter and absorption. Angular distributions of reflected neutrons are approximately cosθ/ sub r/ for all incident neutron conditions. The total albedo results are well modeled by an extension of a previously developed fast-neutron albedo model when Σ/sub abs//Σ/sub t/ (the ratio of absorption to total cross section) is small.

17624 **Supercomputers and magnetic fusion energy.** Nelson, D.B. (U.S. Dept. of Energy, Washington, DC 20545). pp 239-257 of Frontiers of supercomputing. Metropolis, N.; Sharp, D.H.; Worlton, W.J.; Ames, K.R. Berkeley, CA; Univ. of California Press (1986).

Fusion research has its own fascination and its own complexity. In fact, development of controlled fusion energy has been called the most complex technical task ever undertaken by mankind. Statements of that sort are always debatable, but fusion certainly is complex. This paper covers five topics: (1) what controlled fusion is, (2) why computing is important to fusion research, (3) contributions to fusion research from supercomputer use, (4) how supercomputers are actually used, and (5) remaining problems and opportunities and a glimpse into the future.

17625 **Fusion power: One answer to U.S. energy needs in the 21st century.** Kulcinski, G.L.; Conn, R.W.; Cameron, E.N.; Sviatoslavsky, I. (Fusion Engineering Program, Nuclear Engineering Dept., Univ. of Wisconsin, Madison, WI 53706). pp 280-333 of Energy: Four ourselves and our posterity. Perrine, R.L.; Ernst, W.G. Old Tappan, NJ; Prentice Hall Inc. (1985).

The current status of fusion power research and the perception of a fusion power economy is reviewed as of early 1980. It is concluded that considerable progress has been made in the past 20 years and that by the late 1980s the achievement of energy "break even" could propel scientists into the commercialization stage of fusion research. Several fusion reactor designs have been reviewed and the common features used to develop an environmental and safety assessment of fusion versus other forms of energy available in the 21st century. With the existing knowledge as of 1980, it was concluded that fusion power plants will represent a muc' smaller environmental and safety hazard than coal or fission reactor plants even though fusion plants might be somewhat more expensive. Since this paper was written, events in the scientific community have reinforced the foregoing conclusions, and efforts are now under way to reduce even more the hazards discussed herein.

17626 **The fusion-fission hybrid.** Teller, E. (Hoover Institution on War, Revolution and Peace, Stanford, CA 94305). pp 272-279 of Energy: Four ourselves and our posterity. Perrine, R.L.; Ernst, W.G. Old Tappan, NJ; Prentice Hall Inc. (1985).

As the history of the development of fusion energy shows, a sustained controlled fusion reaction is much more difficult to produce than rapid uncontrolled release of fusion energy. Currently, the "magnetic bottle" technique shows sufficient progress that it might applied for the commercial fuel production of /sup 233/U, suitable for use in fission reactors, by developing a fusion-fission hybrid. Such a device would consist of a fusion chamber core surrounded by a region containing cladded uranium pellets cooled by helium, with lithium salts also present to produce tritium to refuel the fusion process. Successful development of this hybrid might be possible within 10 y, and would provide both experience and funds for further development of controlled fusion energy.

17627 **Structural materials for fusion reactor blanket systems.** Bloom, E.E.; Smith, D.L. (Oak Ridge National Lab., Oak Ridge, TN 37831). pp 253-262 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—). Contract AC05-84OR21400.

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

The blanket is one of the largest and most complex systems in a fusion power reactor. The primary functions of the blanket systems are recovery of heat produced in the plasma and breeding of tritium for the reactor fuel cycle. Performance of the blanket in terms of thermodynamic efficiency of the power conversion cycle, reliability, tritium breeding and lifetime of the system will be major factors in determining the cost of electricity from a fusion power reactor. Numerous possibilities exist from which a compatible combination of blanket structural material, coolant, and breeding media must be selected. It is not possible at this time to establish which combination is optimum. Significantly more information will be required on the performance of materials, particularly the structural material and breeding media, before this can be accomplished. If one selects a structural material then the choice of breeding media and coolant is constrained and limits can be placed on the maximum temperature of the structural material.

17628 **Tritium breeding materials.** Hollenberg, G.W.; Johnson, C.E.; Abdou, M.A. (Westinghouse Hanford Co., Richland, WA). pp 265-273 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—).

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

An indisputable need of D-T fusion power remains the identification of a reliable, safe and functional material which efficiently breeds tritium. Although two material classes - solid and liquid breeder material - have been used as the basis for reasonable blanket concepts, critical issues and uncertainty still remain for both. Liquid lithium is fraught mainly with safety (reactivity) concerns, but MHD effects remain a critical issue. Although lithium lead alloys are not as reactive with oxygen, the corrosion of structural materials by Li/sub 17/Pb/sub 83/ and the tritium permeation pose a separate class of risks. The inherent chemical stability of ceramic oxides stimulates the search for solid breeder materials unencumbered by these safety issues. But the accessibility of tritium generated in these materials and the ability to adequately generate tritium are questions which require early answers. In addition, lifetime limiting issues such as lithium transport and swelling, may decide the fate of the otherwise favored Li/sub 2/O, or may not enter in at all.

17629 **Ceramics for fusion devices.** Clinard, F.W. Jr. (Los Alamos National Lab., Los Alamos, NM). pp 276-282 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—).

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

Ceramics are required for a number of applications in fusion devices, among the most critical of which are magnetic coil insulators, windows for RF heating systems, and structural uses. Radiation effects dominate consideration of candidate materials, although good pre-irradiation properties are a requisite. Materials and components can be optimized by careful control of chemical and microstructural content, and application of brittle material design and testing techniques. Future directions for research and development should include further extension of the data base in the areas of electrical, structural, and thermal properties; establishment of a

fission neutron/fusion neutron correlation including transmutation gas effects; and development of new materials tailored to meet the specific needs of fusion reactors.

17630 **Plasma-material interactions.** Wilson, K.L. (Sandia National Labs., Livermore, CA 94550). pp 243-250 of Materials for future energy systems. Metals Park, OH; American Society for Metals (1984). (CONF-840570—).

From American Society for Metals materials for future energy systems conference; Washington, DC, USA (1 May 1984).

Plasma-interactive components must be resistant to erosion processes, efficient in heat removal, and effective in minimizing tritium inventory and permeation. As long as plasma edge temperatures are 50 eV, no one material can satisfy the diverse requirements imposed by these plasma materials interactions. The only solution is the design of duplex, or even more complicated, structures. The material that faces the plasma should be low atomic number, with acceptable erosion and evaporation characteristics. The substrate material must have high thermal conductivity for heat removal. Finally, materials must be selected judiciously for tritium compatibility. In conclusion, materials play a critical role in the achievement of safe and economical magnetic fusion energy. Improvements in materials have already led to many advances in present day device operation, but additional innovative materials solutions are required for the critical plasma materials interaction issues in future power reactors.

17631 **(PNL-SA—14407) Hanford defense mission: Past, present and future.** Munson, L.F. (Pacific Northwest Lab., Richland, WA (USA)). Oct 1986. Contract AC06-76RL01830. 8p. (CONF-8611122—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87002709.

From Monthly meeting of San Juan Island Chapter of the Daughters of the American Revolution; Friday Harbor, WA, USA (11 Nov 1986).

This paper describes the origin of Hanford, and its role in the Manhattan Project, its current role, and what is seen for Hanford in the future. Emphasis is on Hanford's defense mission. However, Hanford is a national resource in a number of areas and some of these are mentioned as well.

17632 **(UCRL—95532) Advanced sensors, telecommunications and data processing: Technological spin-offs from the Strategic Defense Initiative.** Wood, L.L. (Lawrence Livermore National Lab., CA (USA)). Oct 1986. Contract W-7405-ENG-48. 18p. (CONF-8610212—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87003884.

From Strategic defense: commercial applications and political-economic implications conference; Kiel, F.R. Germany (17 Oct 1986).

While the details of Nitze Criteria-satisfying architectures for defense against strategic attack with ballistic missiles are still being worked out, it is already clear that quite advanced sensors, telecommunications and data processing technologies will be features of all of them. It is concluded that the SDI, due to its institutional youthfulness, its charter for large-scale research and its self-evident need for such technologies, is likely to dominate many aspects of these technology development areas during the next two decades, especially if it continues more-or-less as the current American Administration contemplates. Both the technical and the economic aspects of data-gathering and manipulation seem likely to be substantially enhanced, due to the existence of the SDI.

17633 **(DOE/BC/10828—2) A stochastic approach to project planning in an R and D environment: Final report.** Seyedghasemipour, S.J. (East Carolina Univ., Greenville, NC (USA). Dept. of Mathematics). Feb 1987. Contract AS19-84BC10828. 105p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87005347.

This study describes a simulation approach to project planning in an R & D environment by network model. GERT (Graphical Evaluation and Review Technique), a network model, was utilized for the modeling of a hypothetical research and development project. GERT is a network model capable of including randomness in activity duration, probabilistic branching, feedback loop, and multiple terminate node in a project planning. These capabilities make it more suitable for modeling of research and development projects than the previous approaches such as CPM and PERT. SLAM II simulation language is utilized for simulation of the network model. SLAM II is a simulation language which heavily relies on GASP IV and Q-GERTS with powerful modeling capability in a single integrated framework. The simulation is performed on a hypothetical "standard" research and development project. Two cases of project planning are considered. In the first case, the traditional simulation of network model of the hypothetical R & D project is performed. In the second case, learning factor is incorporated in the simulation process. Learning factor, in the context of project planning, means the mean and variance of a probability distribution representing an activity duration is discounted (reduced) every time that activity is repeated. The results and statistics of each case study concerning expected duration of successful completion of the project, probability of washouts, and realization time of milestones are presented in details. The differences between two cases (i.e., with and without learning factor) are discussed. 19 refs.

17634 **(DOE/MA—0269) Annual report to Congress on competition, FY 1986.** (USDOE Assistant Secretary for Management and Administration, Washington, DC. Directorate of Procurement and Assistance Management; USDOE Assistant Secretary for Management and Administration, Washington, DC. Agency Competition Advocate). Jan 1987. 25p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005591.

This report comprises the Department of Energy's (DOE's) second annual report to the Congress as required by Public Law 98-369, the Competition in Contracting Act of 1984 (CICA). The fiscal year (FY) 1986 activities and accomplishments of the Department to increase competition in acquisition contracts are covered in this report along with the goals and plans for FY 1987.

17635 **(INIS-mf—10317) GRS annual report 1985.** (Gesellschaft fuer Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). 1985. 93p. (In German). NTIS (US Sales Only), PC A05/MF A01. File Number DE87750512.

The report summarizes the tasks and objectives of the GRS and gives an account of the activities in the year under review, including a report of the managing board and the organizational tree. The various projects performed and activities accompanying research work are discussed in detail. Information is given on activities in cooperation with foreign organisations, and on publications and conference papers by members of the GRS.

17636 **(INIS-mf—10528) Annual report 1985-1986 [of the Department of Atomic Energy of the Government of India].** (Department of Atomic Energy, Bombay (India)). 1986. 91p. NTIS (US Sales Only), PC A05/MF A01. File Number DE87701296.

The performance and activities during the financial year 1985-1986 of the Department of Atomic Energy (DAE), India and its various units are reported. The various units of the DAE can broadly be categorised into groups: research establishments, production units and public sector undertakings. After taking a general survey, the detailed report is presented under the chapters entitled:

(1) nuclear power, (2) research and development, (3) Atomic Energy Regulatory Board, (4) public sector undertakings, and (5) other activities. Some of the other activities include international relations in the field of nuclear energy, information services, organization of training courses to meet the requirements of programmes of the DAE, technology transfer, financial support to institutions and universities for research in nucler science, and sponsoring of conferences, symposia etc. in the field of nuclear science and its applications. Major achievements of the DAE during the report period are: (1) attainment of criticality by the indigenously designed and built 100 MWt research reactor DHRUVA at Trombay, Bombay, (2) attainment of criticality by the Fast Breeder Test Reactor at Kalpakkam, (3) commissioning of the second unit of the Madras Atomic Power Station and its subsequent synchronisation with the power grid, (4) commissioning of the vitrification plant for management of high level radioactive wastes at Tarapur, and (5) successful testing of a 5 mwt MHD pilot at Tiruchirapalli.

17639 **(AD-A—173730/3/XAB) Toward efficient implementations of PCCG (preconditioned conjugate gradient) methods on vector supercomputers. Technical report.** Melhem. (Pittsburgh Univ., PA (USA). Inst. for Computational Mathematics and Applications). Oct 1986. 37p. (ICMA—86-101). NTIS, PC A03/MF A01.

Large, sparse linear systems that result from the discretization of partial differential equations on regular and irregular domains are considered, and focus is on application of the preconditioned conjugate gradient (PCCG) method to the solution of such systems. More specifically, the goal of this paper is the efficient implementation of the PCCG method on vector supercomputers. The contribution to the above goal is made by 1) introduction of a data structure that way be effectively manipulated on vector machines, 2) utilization of preconditioning matrices which are obtained by incomplete factorization with diagonal update sets, and 3) introduction of new numbering schemes for both regular and irregular grids.

17640 **(ANL—86-51) Deriving properties of systems from properties of parts and lists of connections.** Gabriel, J.R.; Chapman, R.O. (Argonne National Lab., IL (USA)). Dec 1986. Contract W-31109-ENG-38. 25p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87005587.

This paper presents an algorithm in PROLOG for compiling recursively computable descriptions of system behavior from computable descriptions of behavior for parts and lists of interconnections. We give a set of conditions that must be satisfied by various data structures in the computation. It seems possible to provide an informal verification (by hand) that these conditions are true also of the output. 7 refs.

17641 **(CONF-861096—3) Representational issues in machine learning.** Liepins, G.E.; Hilliard, M.R. (Oak Ridge National Lab., TN (USA)). 25 Oct 1986. Contract AC05-84OR21400. 12p. NTIS, PC A02. File Number DE87004617.

From International symposium on methodologies for intelligent systems; Knoxville, TN, USA (22 Oct 1986).

Classifier systems are numeric machine learning systems. They are machine counterparts to the natural genetic process and learn by reproduction, crossover, and mutation. Much publicity has been attended to their ability to demonstrate significant learning from a random start and without human intervention. Less well publicized is the considerable care that must be given to the choices of parameter settings and representation. Without the proper "nurturing environment" genetic algorithms are apt to learn very little. This infusion of human intelligence is often discounted, but the choice of appropriate representation forms the core of much of the current genetic algorithm research. This paper will address some of the representational issues from the perspective of two current experiments, one with scheduling and the other with a simulated robot. 10 refs., 7 figs.

17642 **(CONF-870355—3) How to set up a successful production graphics facility.** Riley, B.A.; Johnston, R.B. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA); Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 7p. NTIS, PC A02. File Number DE87005509.

From Computer graphics '87 conference; Philadelphia, PA, USA (22 Mar 1987).

The Graphic Arts Department (GAD) of Oak Ridge National Laboratory (ORNL) has been using computer graphics for production work since 1979. The computer graphics project has from its beginning been evaluated for production suitability based on cost justification. As the system has evolved, the complexity of production work has increased, and various means have been used to enhance productivity. The paper will discuss the physical requirements of a production system and managerial considerations for operation of such a system.

17643 **(CONF-8506333—1) Automated reasoning and knowledge base design in the scientific programming environment.** Lusk, E.L.; Overbeek, R.A. (Argonne National Lab., IL (USA)). 17 Jun 1985. Contract W-31109-ENG-38. 13p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87001558.

From IFIP WG 2.5 working conference on problem solving environments for scientific computing; Sophia Antipolis, France (17 Jun 1985).

Intelligent aids to the development of scientific software are in great demand but in short supply. Two key components of such expert systems will be automated reasoning and knowledge representation methodologies. First order logic is described as the common language of a class of reasoning systems and database design methods. An overview is given of reasoning paradigms used in current expert systems and of database design methods appropriate to creation of the knowledge base to support such reasoning. Finally, some of the problems seen as topics for further research in this area are described. 14 refs.

17644 **(CONF-8610218—1) Toward formal analysis of ultra-reliable computers: A total systems approach.** Chisholm, G.H.; Kljaich, J.; Smith, B.T.; Wojcik, A.S. (Argonne National Lab., IL (USA); Michigan State Univ., East Lansing (USA). Dept. of Computer Science). 1986. Contract W-31109-ENG-38. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004817.

From 7. Digital Avionics Systems Conference (DASC); Fort Worth, TX, USA (13 Oct 1986).

This paper describes the application of modeling and analysis techniques to software that is designed to execute on four channel version of the the Charles Stark Draper Laboratory (CSDL) Fault-Tolerant Processor, referred to as the Draper FTP. The software performs sensor validation of four independent measures (singlas) from the primary pumps of the Experimental Breeder Reactor-II operated by Argonne National Laboratory-West, and from the vali-

dated signals formulates a flow trip signal for the reactor safety system. 11 refs., 4 figs.

17645 (DOE/ER/25009—290B) Caltech Concurrent Computation Program: Annual report, 1985-86. Fox, G.C. (California Inst. of Tech., Pasadena (USA)). 13 Oct 1986. Contract FG03-85ER25009;AC03-81ER40050. 34p. (CALT—68-1404). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005035.

This report describes the current status of the Caltech Concurrent Computation Program (C^3P), which is a major effort at both the Caltech campus and JPL (Jet Propulsion Laboratory). The major goal of the program is to develop the capability of concurrent processors for general purpose computation with special emphasis on science and engineering. An important feature of the approach is that the members of the project are scientists who lead in the use of computational techniques in their respective research fields, and have already developed state-of-the-art programs on sequential machines. The project currently includes researchers in applied mathematics, aerodynamics, astrophysics, biology, chemistry, computer science, condensed matter, earthquake engineering, geophysics, high energy physics, plasma physics, molecular dynamics, nuclear physics, image processing, and structural mechanics. 2 figs.

17646 (DOE/ER/25009—378) CUBIX: Programming hypercubes without programming hosts. Salmon, J. (California Inst. of Tech., Pasadena (USA). Dept. of Physics). 1986. Contract FG03-85ER25009. 8p. (CONF-8609173—6). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87005030.

From 2. conference on hypercube multiprocessors; Knoxville, TN, USA (29 Sep 1986).

Typically, application programs for hypercubes consist of two parts, a master process running on the host and a server running in the nodes of the hypercube. CUBIX adopts a different viewpoint. Once a program is loaded into the hypercube, that program assumes control of the machine. The host process only serves requests for operating system services. Since it is no more than a file server, the host program is universal; it is unchanged from one application to the next. This programming model has some important advantages; (1) program development is easier because it is not necessary to write a separate program for the host, (2) hypercube programs are easier to develop and debug because they can use standard I/O routines, rather than machine dependent system calls, (3) hypercube programs can often be run on sequential machines with minimal modification, (4) versions of CUBIX exist for both crystalline and amorphous applications. In crystalline applications operating system requests occur synchronously. Requests are either "singular" or "multiple", according to whether all nodes request the same or distinct actions. In amorphous applications requests occur completely asynchronously. The host process serves each request independently. Care is taken so that many processors may simultaneously access the same file.

17647 (DOE/JPL—1012-115) The SIMRAND I computer program: Simulation of research and development projects. Miles, R.F. Jr. (Jet Propulsion Lab., Pasadena, CA (USA)). 15 Feb 1986. Contract AI01-85CE89008. 77p. (JPL-PUB—85-96). NTIS, PC A05/MF A01; GPO Dep. File Number DE87005420.

SIMulation of Research ANd Development Projects (SIMRAND) is a methodology for the selection of the optimal subset of system or tasks to be implemented on a research and development (R & D) project. The SIMRAND methodology models the alternative subsets of systems or tasks under consideration with alternative networks. Each path through an alternative network represents one way of satisfying the project goals. Equations are developed that relate the system or task variables to the measure of preference. Uncertainty is incorporated by treating the variables of the equations probabilistically as random variables, with associated cumulative distribution functions. Cardinal utility functions are assessed over the measure of preference. The SIMRAND I Computer Program is run for each alternative network, incorporating the network structure, the equations, the cumulative distribution functions, and the utility functions in a Monte Carlo simulation model. The alternative network yielding the most-preferred value for the measure of preference, or the highest utility function value, is the optimal network. This Report documents the SIMRAND I Computer Program (Version 5.0 x 03) written in Microsoft FORTRAN for the IBM PC microcomputer and its compatibles. The SIMRAND I Computer Program comprises eleven modules - a main routine and ten subroutines. Two additional files are used at compile time, one inserts the system or task equations into the source code, while the other inserts the dimension statements and common blocks. The SIMRAND I Computer Program can be run on most microcomputers or mainframe computers with only minor modifications to the computer code.

17648 (DP-MS—86-137) Using vision systems when bar code won't work. Leader, D.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). Jan 1987. Contract AC09-76SR00001. 13p. (CONF-870371—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004514.

From ID EXPO meeting; Long Beach, CA, USA (25 Mar 1987).

The Optical Character Reader Vision System is reviewed. Performance characteristics of this system are outlined and compared to bar code reading systems.

17649 (JINR—R-10-85-333) DECAN program for determining parameters of exponential distributions in experiments on the genetically linked radionuclide investigation. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1985. 12p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701337.

The method and algorithm are given intended to solve the problem of determining parameters of complex exponential distributions, which describe the genetically linked decays of radionuclides under conditions of poor statistics and informational data inadequacy. The DECAN program which realizes the method is described. 4 refs.; 2 figs.

17650 (JINR-R—11-85-757) Application of quasi-random numbers for simulation. Kazachenko, O.N.; Takhtamyshev, G.G. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1985. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700810.

Application of the Monte-Carlo method for multidimensional integration is discussed. The main goal is to check the statement that the application of quasi-random numbers instead of regular pseudo-random numbers provides more rapid convergency. The Sobol, Richtmayer and Halton algorithms of quasi-random sequences are described. Over 50 tests to compare these quasi-random numbers as well as pseudo-random numbers were fulfilled. In all cases quasi-random numbers have clearly demonstrated a more rapid convergency as compared with pseudo-random ones. Positive test results on quasi-random trend in Monte-Carlo method seem very promising. 11 refs.; 5 figs.

17651 (KFK—4099) Principles and techniques of data evaluation. Froehner, F.H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Aug 1986. 40p. NTIS (US Sales Only), PC A03/MF A01. File Number DE87750521.

The probabilistic foundations of data evaluations are reviewed, with special emphasis on parameter estimation based on Bayes' theorem and modern methods concerning prior probabilities. The process leading from raw data to evaluated data files is briefly explained for the example of nuclear reaction cross sections, with a discussion of systematic and statistical errors and their propagation. It is shown how evaluators can establish data covariances if error components are properly specified by experimentalists, and how correlated data uncertainties in covariance files are utilised in sensitivity studies and accuracy assessments. The problem of inconsistent data is also addressed briefly.

17652 **(KIYI—85-6) Representation on flow information systems with Petri nets use.** Patlan', Yu.V. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 22p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. File Number DE87700827.

Representation of automatic systems with flow character of data processing with Petri nets use is described. The base elements and operation with them are defined for the flow nets. The application of flow model for software development is considered. 11 refs.; 3 figs.

17653 **(KIYI—85-32) POMNK-programme of experimental data approximation by linear combination of functions.** Sokolov, A.M. (AN Ukrainskoj SSR, Kiev. Inst. Yadernykh Issledovanij). 1986. 40p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87700838.

In paper the methods of problem solution of experimental data approximation comprising the faults, by linear combination of basic functions. Particular emphasis is given to the problem of stability and the estimation of result precision. The instructions on application and the programme codes are given. Produced software are oriented to the PDP computer. 16 refs.

17654 **(ORNL/CSD/TM—240) Upgrade of the GRESS (test version D) precompiler to allow triply-dimensioned arrays.** Horwedel, J.E.; Pin, F.G. (Oak Ridge National Lab., TN (USA)). Dec 1986. Contract AC05-84OR21400. 35p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005286.

GRESS is a FORTRAN precompiler and run time library which automatically processes computer models and adds derivative-taking capabilities to the normal calculated results. The GRESS system is under development at ORNL and work is proceeding in upgrading test versions of the precompiler to allow processing by GRESS of most of the ANSI X3.9-1978 FORTRAN syntax. Heretofore, a major limitation has been the inability of GRESS to process arrays with more than two dimensions. Consequently, a significant amount of human effort was required to convert three- and higher-dimensional arrays into two-dimensional arrays for processing with GRESS. This report describes the addition of ten operation codes to the GRESS precompiler and run time library to allow application to FORTRAN programs with three-dimensional arrays. The new operation codes were tested on a sample problem. A comparison of CPU time is made for sample problems run on a VAX 8600 computer with one-, two-, and three-dimensional arrays. It is recommended that GRESS be further modified to accommodate higher-dimensional arrays up to the ANSI X3.9-1978 limit of seven dimensions.

17655 **(ORNL/TM—10038) On the use of CORLIB subroutines for the solution of a model fluid flow problem.** Thompson, S. (Oak Ridge National Lab., TN (USA)). Dec 1986. Contract AC05-84OR21400. 58p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005285.

This report describes the use of several subroutines from the CORLIB core mathematical subroutine library for the solution of a model fluid flow problem. The model consists of the Euler partial differential equations. The equations are spatially discretized using the method of pseudo-characteristics. The resulting system of ordinary differential equations is then integrated using the method of lines. The stiff ordinary differential equation solver LSODE (2) from CORLIB is used to perform the time integration. The non-stiff solver ODE (4) is used to perform a related integration. The linear equation solver subroutines DECOMP and SOLVE are used to solve linear systems whose solutions are required in the calculation of the time derivatives. The monotone cubic spline interpolation subroutines PCHIM and PCHFE are used to approximate water properties. The report describes the use of each of these subroutines in detail. It illustrates the manner in which modules from a standard mathematical software library such as CORLIB can be used as building blocks in the solution of complex problems of practical interest. 9 refs., 2 figs., 4 tabs.

17656 **(PNL-SA—14017) Managing the data analysis process.** Cowley, P.J.; Carr, D.B.; Nicholson, W.L. (Pacific Northwest Lab., Richland, WA (USA)). Jul 1986. Contract AC06-76RL01830. 7p. (CONF-860751—3). NTIS, PC A02/MF A01; GPO Dep. File Number DE87004129.

From 3. international workshop on statistical and scientific database management; Luxembourg, Luxembourg (22 Jul 1986).

Data analysis management is a methodology for increasing the productivity of the data analyst by providing automated tools for the capture, management, and restoration of information generated during a computer-assisted data analysis. We have developed a prototype system that allows the analyst to manage the data analysis process by designating points in the analysis at which the components of computation, data structures, and analyst understanding are captured for later use. 8 refs., 3 figs.

17657 **(UCID—20664-86) Computer science research: Computation directorate.** McGraw, J.R.; Grupe, K.F. (Lawrence Livermore National Lab., CA (USA)). 1987. Contract W-7405-ENG-48. 114p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87005198.

This second annual report highlights research activities in computer science and numerical analysis carried out within the Computation Directorate of the Lawrence Livermore National Laboratory (LLNL). Its purpose is to provide a technical introduction to current areas of study and to report on recent progress. Research features a heavy emphasis on multiprocessing. Although multiprocessing plays a major role in nearly every proposed new supercomputer system, much work needs to be done before we can understand how to use it effectively. In addition to multiprocessing studies, strong efforts are continuing in some of the more traditional areas of computer science, particularly numerical methods.

17658 **(UCID—20946) Micro-to-Mainframe Communication Standard: Subsystem design analysis report.** Burgher, L.M.; Sharpe, N.; Prassinos, P. (Control Data Corp., Pleasanton, CA (USA); Lawrence Livermore National Lab., CA (USA)). Sep 1986. Contract W-7405-ENG-48. 64p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87005200.

This report documents the work performed in the implementation of the micro-to-mainframe (MMCS) project. It describes the methodology used in the technical evaluation towards achieving the MMCS results. It also identifies the source materials used in collecting the technical data. Finally, it reports the analysis results of the evaluation work performed.

17659 **(UCRL—95652) A diffusion operator for Lagrangian meshes.** Margolin, L.G.; Tarwater, A.E. (Lawrence Livermore National Lab., CA (USA)). Nov 1986. Contract W-7405-ENG-48. 15p. (CONF-8611115—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE87003520.

From Nuclear explosives code development conference; Albuquerque, NM, USA (17 Nov 1986).

A new diffusion operator for a Lagrangian mesh of irregular quadrilaterals is described. The operator diffuses cell-centered quantities and differs from previous works both in construction and in its form. The diffusion operator is constructed by requiring it to exactly reproduce certain properties of the physical operator. These properties are conservation, self-adjointness and the ability to exactly capture quadratic yields. These properties are expressed as a system of linear equations whose solution fields the coefficients of the operator. 6 refs., 8 figs.

17660 (ZfI-Mitt—109, pp 27-66) **Computer codes for treatment of highly excited atomic states.** Lorenz, M.; Hartmann, E. Dec 1985. (In German). NTIS (US Sales Only), PC A06/MF A01. File Number DE87780054.

In Report of the Central Institute for Isotope and Radiation Research.

This paper is intended to describe several computer codes for treating some excitation modes, the intraatomic relaxation and the deexcitation of atomic states carrying single or multiple vacancies. By considering the relevant multiplet effects in open shells an assessment is made of the applicability to radiative and non-radi-

ative deexcitation. Although being concise this methodical survey provides all the necessary information (including input descriptions) for exploiting the programm system for purposes within its scope.

17661 **A compiler-assisted cache coherence solution for multiprocessors.** Veidenbaum, A.V. (Center for Supercomputing Research and Development, Univ. of Illinois at Urbana-Champaign, Urbana, IL 61801). pp 1029-1036 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

The existing solutions to multiprocessor cache coherence problem are not suitable, in the authors' opinion, for systems with a large number of processors. They propose a new solution in which a compiler generates cache management instructions. Conditions necessary for cache coherence violation are defined. The structure of a program and its dependence graph are used to detect when these conditions become true, and the instructions to enforce coherence are generated. No communication between processors is required at run-time to enforce coherence. The correctness of the solution is proved.

17662 **Speedup bounds and processor allocation for parallel programs on multiprocessors.** Polychronopoulos, C.D.; Banerjee, V. (Center for Supercomputing Research and Development, Univ. of Illinois at Urbana-Champaign, Urbana, IL 61801). pp 961-968 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

The main aim of this paper is to study allocation of processors to parallel programs executing on a multiprocessor system, and the resulting speedups. The authors first consider a general program represented as a sequence of steps consisting of parallel operations, then one represented as a task graph whose nodes are do across loops and whose edges represent precedence constraints, and finally a single do across loop. General bounds on program speedup are discussed and measurements of code parallelism for the LINPACK numerical package are presented.

17663 **Vector processing on the Alliant FX/8 multiprocessor.** Abu-Sufah, W.; Malony, A.D. (Center for Supercomputing Research and Development, Univ. of Illinois at Urbana-Champaign, 104 S. Wright St., Urbana, IL 61801-2987). pp 559-566 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

The Alliant FX/8 multiprocessor implements several high-speed computation ideas in software and hardware. Each of the 8 computational elements (CEs) has vector capabilities and multiprocessor support. Generally, the FX/8 delivers its highest processing rates when executing vector loops concurrently. In this paper, the authors present extensive empirical performance results for vector processing on the FX/8. The vector kernels of the LANL BMK8a1 benchmark are used in the experiments. They execute each kernel on 1 and 8 CEs and show the measured execution rate (in MFLOPS) as a function of vector length. They assess the performance of 1 CE as a vector processor by finding the vector lengths where rector processing exceeds that of scalar processing and calculating Hockney's n/sub 1/2/. For 8 CEs, they give upper/lower bounds on the achieved speedups and on the multiprocessing overhead.

17664 **Compiler generated synchronization for DO loops.** Midkiff, S.P.; Padua, D.A. (Center for Supercomputing Research and Development, Univ. of Illinois at Urbana-Champaign, Urbana, IL 61801). pp 544-551 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

This paper presents methods for the compile time generation of synchronization instructions for parallel loops running on a multiprocessor. A synchronization instruction set and architecture are defined, and using these it is shown how to synchronize FORTRAN source loops so that dependences on the parallel loop are enforced. Construction of an applicable dependence graph is covered. A program transformation is given that increases the parallelism that can be utilized in a parallel loop containing nested loops. Finally, a generalizable technique is presented for reducing the number of dependences needing synchronizing in a parallel loop.

17665 **Processor self-scheduling for multiple-nested parallel loops.** Tang, P.; Yew, P.C. (Center for Supercomputing Research and Development, Univ. of Illinois at Urbana-Champaign, Urbana, IL 61801). pp 528-535 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

Processor self-scheduling is a useful scheme in a multiprocessor system if the execution time of each iteration in a parallel loop is not known in advance and varies substantially, or if there are multiple nestings in parallel loops which makes static scheduling difficult and inefficient. By using efficient synchronization primitives, the operating system is not needed for loop scheduling. The overhead for the processor self-scheduling is small. The authors present a processor self-scheduling scheme for a single-nested parallel loop, and extend the scheme to multiple-nested parallel loops. Barrier synchronization mechanisms in the processors self-scheduling schemes are also discussed.

17666 **Execution of parallel loops on parallel processor systems.** Polychronopoulos, C.D.; Kuck, D.J.; Padua, D.A. (Center for Supercomputing Research and Development, Univ. of Illinois at Urbana-Champaign, Urbana, IL 61801). pp 519-527 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

Ways of coordinating large numbers of processors to execute a parallel program as fast as possible are of key importance to the design and efficient use of parallel processor systems. In this paper the authors discuss issues on program parallelism and scheduling for parallel processor systems. They break the scheduling process into three basic activities, and focus on processor assignment to parallel loops. Optimal processor assignment algorithms are presented for simple and complex nested parallel loops. These algorithms can be applied at compile-time, or can be implemented as hardware modules to solve the processor assignment problem optimally at run-time. Speedup measurements for EISPACK and IEEE DSP subroutines that result from the optimal assignment of processors to parallel loops are also presented. These measurements indicate that optimal assignments result in almost linear speedups on parallel processor machines with a few tens of processors, and significantly high speedups for machines with hundreds or thousands of processors.

17667 **A communication model for optimizing hierarchical multiprocessor systems.** Abraham, S.G.; Davidson, E.S. (Center for Supercomputing Research and Development, Univ. of Illinois at Urbana-Champaign, 305 Talbot Lab., 104 S. Wright St., Urbana, IL 61801). pp 467-474 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

Experimental hierarchical multiprocessor systems, such as the Cm*, EGPA machine and the Cedar, show that hierarchical systems encompass a range of processor configurations and interprocessor communication links. Cost and performance models are developed for the components of a hierarchical system where all processors share a global memory and processors are grouped into clusters that share a cluster memory. With these models, it is shown that a unique combination of processor speeds and numbers best achieves a given performance goal. Given the distribution of interprocessor communication, the cluster size is chosen to minimize average communication delay. When the patterns of communication correspond directly to some parallel architecture, the analysis indicates the effectiveness of the hierarchical system in emulating that architecture. The primary objective is to compare various processor configurations in large systems. Thus, the models developed ignore factors that tend to have a similar effect on a wide range of configurations.

17668 **Multiprocessor Jacobi algorithms for dense symmetric eigenvalue and singular value decompositions.** Berry, M.; Sameh, A. (Center for Supercomputing Research and Development, Univ. of Illinois, Urbana, IL 61801). pp 433-440 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

The authors present two parallel algorithms based on Jacobi's method for real symmetric matrices to determine the complete eigensystem of a dense real symmetric matrix and the singular value decomposition of rectangular matrices on a multiprocessor. The intent is to study the advantages of using Jacobi and Jacobi-like schemes over new and existing EISPACK and LINPACK routines on an Alliant FX/8 computer system. For the dense symmetric eigenvalue problem, the authors show promising results for small-order matrices. A "one-sided" Jacobi-like algorithm which produces the singular value decomposition of a rectangular matrix is shown to provide superior performance for rectangular matrices in which the number of rows is much larger than the number of columns.

17669 **Optimizing matrix operations on a parallel multiprocessor with a hierarchical memory system.** Jalby, W.; Meier, U. (Center for Supercomputing Research and Development, Univ. of Illinois, Urbana, IL 61801). pp 429-432 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

Memory organizations of supercomputers (CRAY 2, CEDAR) tend to become more and more complex, and correspondingly data management in these memories becomes a crucial factor for achieving high perform. nce. The authors study here an architecture combining vector and parallel capabilities on a two-level shared memory structure. For this class of architecture, they analyze and optimize matrix multiplication algorithms so as to obtain high efficiency kernels which can be used for many numerical algorithms such as LU and Cholesky factorizations, as well as Gram-Schmidt and Householder orthogonal factorization schemes. The performance of such kernels on the Alliant FX/8 multiprocessor is described in detail.

17670 **Parallel structuring of control and resources management systems for parallel programs.** O'Dell, R.; Browne, J.C. (Dept. of Computer Sciences, The Univ. of Texas at Austin, Austin, TX 78712). pp 153-156 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

This paper presents a study of the effect of parallel structuring of control and resource management algorithms upon the execution of parallel computations. A simple analytic model of general parallel computation incorporating overhead effects was developed and applied to this example. Speed-up shows a square root dependency on the degree of parallelism in the control and resource management algorithms. Variance in processing time for the tasks being controlled was observed to be beneficial over certain ranges of execution to the parallelism obtainable by the control system.

17671 **SK-banyans: A unified class of banyan networks.** deMelo, J.; Jenevein, R.M. (Dept. of Electrical and Computer Engineering, Univ. of Texas at Austin, Austin, TX 78712). pp 100-107 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

A unified class of banyan networks is proposed which presents better distance properties than SW-banyans. This new class is called SK-banyans for the SKewing scheme that is adopted for the connections between nodes at different levels. Its definition is given along with the characteristic properties relative to SW-banyans. A consideration is given for the virtue of symetric connection schemes in relation to their distance properties. Examples of different Characteristic Connection Patterns (CCP's) for SK-banyans are presented. A general construction scheme is proposed and a comparison of distance properties of SK- and SW-banyans is presented. Optimality criteria have been developed to determine whether a given CCP provides the best distance properties.

17672 **A pipelined solution method of tridiagonal linear equation systems.** Gao, G.R. (Lab. for Computer Science, Massachusetts Institute of Technology, Cambridge, MA 02139). pp 84-91 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

A pipelined solution method for tridiagonal systems of linear equations is proposed which introduces parallelism in a way that may be effectively exploited by static data flow computers. It eliminates the substantial data rearrangement overhead incurred by many existing parallel algorithms, and sustains a relatively constant parallelism during various phases of program execution. Using the new method, the authors outline a pipelined code mapping scheme. The principle outlined in this paper may be extended to other suitable parallel machine architecture.

17673 **Distributing hot-spot addressing in large-scale multiprocessors.** Yew, P.C.; Tzeng, N.F.; Lawrie, D.H. (Center for Supercomputing Research and Development, Univ. of Illinois at Urbana-Champaign, Urbana, IL 61801). pp 51-58 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

When a large number of processors try to access a common variable, referred to as hot-spot accesses, not only can the resulting memory contention seriously degrade performance, but it may also cause tree saturation in the interconnection network which blocks both hot-spot and regular requests alike. It is shown elsewhere that even if only a small percentage of all requests are to a hot-spot lo-

cation, these requests can cause very serious performance problems, and networks that do the necessary combining of requests are suggested to keep the interconnection network and memory contention from becoming a bottleneck. Instead the authors propose a software combining tree concept and show that it is effective in decreasing memory contention and preventing tree saturation because it distributes hot-spot accesses over a software tree whose nodes can be dispersed among many memory modules. Thus it is an inexpensive alternative to expensive combining networks.

17674 **The effectiveness of combining in shared memory parallel computers in the presence of 'hot spots'.** Lee, G.; Kruskal, C.P.; Kuck, D.J. (Center for Supercomputing Research and Development, Univ. of Urbana, IL 61801). pp 35-41 of Proceedings of the 1986 international conference on parallel processing. Hwang, K.; Jacobs, S.M.; Swartzlander, E.E. Piscataway, NJ; IEEE Service Center (1986). (CONF-860877—).

From International conference on parallel processing; St. Charles, IL, USA (19 Aug 1986).

Concurrent requests to a shared variable by many processors on a shared memory machine can create contention that will be serious enough to stall large machines. This idea has been formalized in the "hot spot" traffic model, where a fixed fraction of memory requests is for single shared variable. "Combining," in which several requests for the same variable can be combined into a single request, has been suggested as an effective method of alleviating this contention. The NYU Ultracomputer and the IBM RP3 machine use "pairwise" combining, in which only two requests for the same variable can be combined at a switch. The authors study the effectiveness of combining. In particular, it turns out that pairwise combining cannot handle hot spots if the machine size is large enough. They suggest ways to overcome this weakness.

17675 **Japanese supercomputer initiatives: Challenge and response.** Worlton, W.J. (Los Alamos National Lab., Los Alamos, NM). pp 46-65 of Frontiers of supercomputing. Metropolis, N.; Sharp, D.H.; Worlton, W.J.; Ames, K.R. Berkeley, CA; Univ. of California Press (1986).

Some of the key factors in the supercomputing market are summarized. Speed is perhaps the most important single factor, but this is left as a question because there are no available benchmark data on the speed of the Japanese computers. The length of the design cycle may favor Japanese firms because they are vertically integrated. This implies that the American firms must counter this Japanese advantage, and both Cray Research (CRI) and Engineering Technology Associates (ETA) Systems are taking steps to do this. CRI is developing an in-house gallium arsenide development capability, and ETA is planning to use CMOS technology, which, although not an in-house capability for ETA, is expected to be available on the time scale needed. The reliability factor has been noted as a Japanese advantage just on general grounds of the well-known reliability of Japanese electronics.

17676 **The New York University Ultracomputer.** Gottlieb, A. (New York Univ., New York, NY). pp 66-77 of Frontiers of supercomputing. Metropolis, N.; Sharp, D.H.; Worlton, W.J.; Ames, K.R. Berkeley, CA; Univ. of California Press (1986).

Continuing advances in very large scale integration (VLSI) technology promise to provide fast floating-point processors and megabit memory chips within the present decade. The New York University (NYU) "Ultracomputer Group" has been studying how such ensembles can be constructed and has produced a design that includes novel hardware and software components. A pervasive consideration for this design is that it be free of serial sections (that is, hardware or software modules to which each processor requires exclusive access), because even small serial sections become a bottleneck bounding the maximum possible speedup. This paper outlines the proposed hardware design and describes its relation to other research in parallel processing.

17677 **Computation: The nexus of nuclear weapon development.** Henderson, D.B. (Los Alamos National Lab., Los Alamos, NM). pp 141-151 of Frontiers of supercomputing. Metropolis, N.; Sharp, D.H.; Worlton, W.J.; Ames, K.R. Berkeley, CA; Univ. of California Press (1986).

The development of nuclear weapons is qualitatively unlike any other engineering enterprise in that a broad collection of phenomena from generally distinct fields of science is exploited in a tight interdisciplinary fashion. Many of the parameters are at the limits of both the current practice and (accurate) knowledge base. Moreover, and most importantly, the exploited phenomena are deliberately nonlinear. In contrast, almost all other engineering practices are linear or are at least linearized. The nonlinear processes are often nonlocal and are often in non-equilibrium. How things work depends on unobserved and, in general, unobservable phenomena. Numerical simulation through computer codes is, therefore, central to the design process. Simulation is the only place in which all of the nonlinear complex phenomena are integrated.

17678 **An overview of computing at Los Alamos.** Ewald, R.H. (Los Alamos National Lab., Los Alamos, NM). pp 152-156 of Frontiers of supercomputing. Metropolis, N.; Sharp, D.H.; Worlton, W.J.; Ames, K.R. Berkeley, CA; Univ. of California Press (1986).

The Los Alamos National Laboratory is operated by the University of California for the United States Department of Energy (DOE). The Laboratory employs about 7000 people, and its mission is to perform research and development activities related to national security and energy programs. To support its own and other national programs, the Laboratory has developed a state-of-the-art scientific computing network that supports about 4500 users (about 3500 are Laboratory employees and about 1000 are users at other installations throughout the United States).

17679 **Operating systems and basic software for high-performance parallel architecture.** Browne, J.C. (Univ. of Texas, Austin, TX). pp 157-178 of Frontiers of supercomputing. Metropolis, N.; Sharp, D.H.; Worlton, W.J.; Ames, K.R. Berkeley, CA; Univ. of California Press (1986).

It is well established that future generations of supercomputers will be based on parallel architectures. It is critical to recognize that parallel computing is a systems problem, not just an architecture problem or a component problem. Development of basic software, including operating systems and programming languages for parallel architecture, is intrinsically more difficult than development of basic software systems for sequentially structured architectures. This added degree of difficulty results from the greater dimensionality and complexity of models of parallel computation over models of sequential computation. This paper explores the sources of complexity and the development of efficient basic software systems for parallel architectures. One approach to the two problems of management of many resources and the complexity of parallel architectures is defined and discussed in detail. This is the approach built upon reconfigurable architectures and partitioning rather than sharing of resources. The structure of the TRACOS operating system for the Texas Reconfigurable Array Computer (TRAC) is used as an example.

17680 **The role of better algorithms.** Glimm, J. (New York Univ., New York, NY). pp 217-230 of Frontiers of supercomputing. Metropolis, N.; Sharp, D.H.; Worlton, W.J.; Ames, K.R. Berkeley, CA; Univ. of California Press (1986).

Computers will affect science and technology at least as profoundly as did the invention of calculus. The reasons are the same. As with calculus, computers have increased and will increase enormously the range of soluble problems. The full development of these events will occupy decades, and the rapid progress that one sees currently is a strong sign that the impact of computers will be much greater in the future than it is today. This rapid progress has been found in two areas: in the computers themselves and in the methods for using them, that is, in the hardware and in the software. In this paper the authors focus on the second of these issues, which is the requirement of computational science for better algorithms. The needs for better algorithms have been recognized by others, and thoughtful people have projected comparable roles for hardware and software in overall computational progress.

17681 **Super problems for supercomputers.** Harlow, F.H. (Los Alamos National Lab., Los Alamos, NM). pp 231-238 of Frontiers of supercomputing. Metropolis, N.; Sharp, D.H.; Worlton, W.J.; Ames, K.R. Berkeley, CA; Univ. of California Press (1986).

The authors discuss topics such as generalized Boltzmann's equations and flow in complex spaces. The authors have used some of these techniques for the study of problems in continuum mechanics and have become familiar with procedures that are available for their solution. One can apply some of these same ideas to the most remarkable kinds of problems, with results that have a strong potential for being realistic. Indeed, one might go so far as to say that such investigations can be crucial to the understanding of where humanity is heading in future generations.

9904 Law

17682 **(INIS-XN—23) Atomic Energy Authority Act 1986.** (International Atomic Energy Agency, Vienna (Austria)). 19 Feb 1986. 7p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701297.

Under this Act the UKAEA is given power to borrow so that it can finance its capital expenditure programme, and will undertake a debt to the Secretary of State for Energy representing its assets. Power is given for the Government to guarantee such borrowing. The UKAEA has been organised financially on the basis of a trading fund. The Act came into force on 1 April 1986. (NEA).

17683 **(INIS-XN—24) Treaty Series No. 60 (1985) - Agreement between the Government of the United Kingdom of Great Britain and Northern Ireland and the Government of the People's Republic of China for Co-operation in the Peaceful Uses of Nuclear Energy with exchange of letters - London, 3 June 1985.** (International Atomic Energy Agency, Vienna (Austria)). 3 Jun 1985. 6p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87701298.

The Agreement came into force on the date of its signature. In English with Exchange of Letters also in Chinese.

The Agreement covers in particular co-operation in civil nuclear research, including reactor safety, radioactive waste management and radiation protection. Co-operation between the two Parties shall be for exclusively peaceful purposes and the transfer to third parties of any nuclear material, equipment or facilities supplied in the context of the present Agreement may not take place without prior consultation between the two Governments. In the event of such a transfer, the two Governments shall ensure that the third state pledges peaceful use only and accepts IAEA safeguards. (NEA).

17684 **(INIS-XN—40) Decree relating to the competence of the National Board of Health to issue permits under the Radiation Protection Act, 5.2.1959/47.** (International Atomic Energy Agency, Vienna (Austria)). 5 Feb 1959. 1p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701302.

This decree made under the Radiation Protection Act of 1957 concerns the National Board of Health and provides in particular that the Board is the competent authority to issue permits in the field of radiation protection. (NEA).

17685 **(INIS-XN—43) Decree setting up the Atomic Energy Commission, as amended (No. 76/58).** (International Atomic Energy Agency, Vienna (Austria)). 14 Feb 1958. 6p. (In Finnish). NTIS (US Sales Only), PC A02/MF A01. File Number DE87701305.

English translation attached.

This Decree issued in implementation of Section 7 of the Atomic Energy Act of 25th October 1957 sets up the Atomic Energy Commission. The Commission, composed of not more than 5 members appointed by the Council of State for a period of 3 years, is subordinate to the Ministry of Trade and Industry. In the field of Atomic Energy, its task is to make proposals, to give expert opinions, to deal with questions relating to international co-operation, to ensure liaison with scientific and technical organisations and industrial institutions whose activities coincide with its own sphere of activity. The Commission must submit a report on its activities to the Ministry of Trade and Industry each year. (NEA).

CORPORATE AUTHOR INDEX

In the Corporate Author Index, report literature is indexed using the name of the organization or institution responsible for issuing the report. Headings are provided for all report literature and for published literature for which a corporate approach is especially desirable, e.g., symposium and conference proceedings.

Each entry under a corporate heading gives the document title and the volume and abstract numbers. The document type, e.g., R for Report; country of publication, e.g., US; and language of the document, e.g., In German, are given in parentheses at the end of the entry. If no language statement appears, the language is English. Tables of document types and country of publication codes appear after the indexes.

DOE Energy Data Base: Corporate Author Entries (DOE/TIC-4585) is used in the standardization of corporate entries. DOE/TIC-4585 is available for purchase from the National Technical Information Service (NTIS), U. S. Department of Commerce, Springfield, Virginia 22161.

Vacancy migration enthalpy in tungsten at high temperatures, 12:16252 (R;US)
Validation of seismic soil-structure interaction analysis methods: EPRI [Electric Power Research Institute]/NRC [Nuclear Regulatory Commission] cooperation in Lotung, Taiwan, experiments, 12:16019 (R;US)
Variational Monte Carlo calculations of few-body nuclei, 12:17206 (R;US)
What underlies the Anderson Hamiltonian, 12:17357 (R;US)

Arizona Public Service Co., Phoenix (USA)
Extended transient-midterm stability package: A user's manual for the stability, output analysis, and transient equivalent grouping programs: Computer code manual, 12:15755 (R;US)
Extended transient-midterm stability package: Final report, 12:15759 (R;US)
Extended transient-midterm stability package: Support programs technical guide: Computer code manual, 12:15757 (R;US)
Extended transient-midterm stability package: Technical guide for the stability program: Computer code manual, 12:15754 (R;US)
Extended transient-midterm stability package: Test case manual: Computer code manual, 12:15758 (R;US)
Extended transient-midterm stability package: User's manual for the power flow program: Computer code manual, 12:15756 (R;US)

Arizona State Univ., Tempe (USA). Dept. of Electrical Engineering
Extended transient-midterm stability package: A user's manual for the stability, output analysis, and transient equivalent grouping programs: Computer code manual, 12:15755 (R;US)
Extended transient-midterm stability package: Final report, 12:15759 (R;US)
Extended transient-midterm stability package: Support programs technical guide: Computer code manual, 12:15757 (R;US)
Extended transient-midterm stability package: Technical guide for the stability program: Computer code manual, 12:15754 (R;US)
Extended transient-midterm stability package: Test case manual: Computer code manual, 12:15758 (R;US)
Extended transient-midterm stability package: User's manual for the power flow program: Computer code manual, 12:15756 (R;US)

Arizona Univ., Tucson (USA)
Site characterization field manual for near surface geologic disposal of low-level radioactive waste, 12:15422 (R;US)

Atmospheric and Environmental Research, Inc., Cambridge, MA (USA)
Extended atmospheres of outer planet satellites and comets. Annual report, 1 August 1985-31 July 1986, 12:17031 (R;US)

Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.
Fuel performance and fission product release during loss of coolant and severe fuel damage accidents, 12:16022 (R;CA)

Auburn Univ., AL (USA). Dept. of Chemical Engineering
Laser light-scattering and laser fluorescence studies of solvent extraction systems, 12:16384 (R;US)

Australian Atomic Energy Commission Research Establishment, Lucas Heights. Local Liaison Working Party
APTCARE - Lucas Heights. A plan to cope with accidents at the Research Establishment of the Australian Atomic Energy Commission, Lucas Heights, NSW, 12:16037 (R;AU)

B

Bartol Research Foundation of the Franklin Inst., Newark, DE (USA)
Nucleon decay experiments: status and prospects, 12:17094 (R;US)

Battelle Columbus Div., OH (USA)
Evaluation of advanced materials for severe slurry erosion service: Final report, 12:15290 (R;US)

Battelle Columbus Labs., OH (USA)
Characterization of stack emissions from municipal refuse-to-energy systems. Final report, 12:16715 (R;US)
Hydrogen degradation of pipeline steels: Final report, 12:16242 (R;US)
Industrial end-use planning methodology (INDEPTH): Demonstration of design: Volume 1, Econometric forecasting models: Interim report, 12:16182 (R;US)

Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation
Alternative methods to manage waste salt from repository excavation in the Deaf Smith County and Swisher County locations, Texas: A scoping study: Technical report, 12:15407 (R;US)
Laboratory investigation of crushed salt consolidation and fracture healing, 12:16925 (R;US)
Preliminary rock mechanics laboratory: Investigation plan, 12:16924 (R;US)
Rail transportation corridor analysis report: Deaf Smith County location in the Palo Duro Basin, Texas, 12:15487 (R;US)

BDM Corp., Albuquerque, NM (USA)
Vibrational characteristics and structure of heavy metal fluoride glasses containing thorium and zirconium, 12:16334 (R;US)

Bell Labs., Murray Hill, NJ (USA)
Low temperature properties of $CeCu_6$ and related compounds, 12:16285 (R;US)

Bettis Atomic Power Lab., West Mifflin, PA (USA)
An automated two-dimensional laser velocimeter system, 12:16674 (R;US)
In-pile and out-of-pile corrosion behavior of thoria-urania pellets (LWBR [Light Water Breeder Reactor] Development program), 12:15857 (R;US)
On-line ion chromatography system, 12:16395 (R;US)

Bhabha Atomic Research Centre, Bombay (India)
Annual report of the Nuclear Physics Division [for] period ending December 31, 1982, 12:17190 (R;IN)

Biennial report for 1982 and 1983 of Electronics Division, 12:16593 (R;IN)
BOXER3: a three dimensional integral transport code for PHWR supercell, 12:15837 (R;IN)
Calculation of damage cross section, 12:17305 (R;IN)
Calibration of high-dose radiation facilities (Handbook), 12:17329 (R;IN)
Computerised automatic pellet inspection unit for FBTR fuel, 12:15955 (R;IN)
Cryogenic regenerators, 12:16438 (R;IN)
Determination of La, Ce, Pr and Nd in carbon steels by optical emission spectroscopy (OES), 12:16379 (R;IN)
Determination of Ti, Cr, Cu and Ta in niobium oxide by X-ray fluorescence method, 12:16381 (R;IN)
Development of optical thin film technology for lasers and synchrotron radiation, 12:16348 (R;IN)
Electrode boundary layer and its influence on the power output characteristics in open-cycle Faraday MHD generators, 12:16184 (R;IN)
Heavy ion collisions, the quark-gluon plasma and antinucleon annihilation, 12:17125 (R;IN)
Liquid Metal MHD Generator Systems, 12:16185 (R;IN)
Low incremental control worth reload patterns for BWRs, 12:15761 (R;IN)
Pool type liquid helium cryopump, 12:16439 (R;IN)
Progress report on nuclear data activities in India for the period from July 1984 to December 1985, 12:17191 (R;IN)
Radiation enhanced self diffusion in silver, 12:17336 (R;IN)
RF-phase measurement and optimization for the Variable Energy Cyclotron, Calcutta, 12:16520 (R;IN)
Semi-microdetermination of nitrogen in actinide compounds by Dumas method, 12:16376 (R;IN)
Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique, 12:16375 (R;IN)
SHARDA - a program for sample heat, activity, reactivity and dose analysis, 12:17304 (R;IN)
Spectrographic determination of boron in Mo-B microalloys, 12:16380 (R;IN)
Status of data and data needs for XRF and PIXE based element analysis, 12:16377 (R;IN)
Tarapur dual cycle BWR - analysis of steam generator bypass incident, 12:15762 (R;IN)
Thermodynamic data of intermetallic compounds, 12:16238 (R;IN)
Two dimensional analysis for magnetic flux distribution in electromagnet used for MHD applications, 12:17086 (R;IN)
Water Chemistry Division Progress Report, April 1983-April 1985, 12:16399 (R;IN)
X-ray fluorescence analysis of thulium oxide/oxalate for rare earth impurities, 12:16378 (R;IN)
X-ray fluorescence method for the determination of potassium, rubidium and cesium in thoria, 12:16374 (R;IN)

Bochum Univ. (Germany, F.R.). Lehrstuhl fuer Energieanlagentechnik
Experimental investigation of the formation of nitrogen oxides in combustion of coal dust. 2nd intermediate report covering the period from May 1, 1983 to June 30, 1984, 12:15329 (R;DE;In German)

Boeing Computer Services Co., Seattle, WA (USA)
Extended transient-midterm stability package: Technical guide for the stability program: Computer code manual, 12:15754 (R;US)

Boeing Computer Services Co., Tukwila, WA (USA)
Extended transient-midterm stability package: A user's manual for the stability, output analysis, and transient equivalent grouping programs: Computer code manual, 12:15755 (R;US)
Extended transient-midterm stability package: Final report, 12:15759 (R;US)
Extended transient-midterm stability package: Support programs technical guide: Computer code manual, 12:15757 (R;US)
Extended transient-midterm stability package: Test case manual: Computer code manual, 12:15758 (R;US)
Extended transient-midterm stability package: User's manual for the power flow program: Computer code manual, 12:15756 (R;US)

Bordeaux-1 Univ., 33 - Gradignan (France). Centre d'Etudes Nucleaires
Application of the PFIS method to the LISE spectrometer at GANIL: (Experiment beta performed at the GANIL National Laboratory in Caen (France)) beta decay of light neutron rich exotic nuclei, 12:17217 (R;FR)
Structure effects in (n,α) reactions on Nd and Zr isotopes, 12:17228 (R;FR)
Two-particle correlations in $^{40}Ar + {}^{197}Au$ at 60 MeV/A, 12:17234 (R;FR)

Brandeis Univ., Waltham, MA (USA)
Effect of light and development of photosynthetic cells: Final report, 12:15602 (R;US)

Brigham Young Univ., Provo, UT (USA)
Pioneer 10 and 11 (Jupiter and Saturn) magnetic field experiments. Final report, 12:17032 (R;US)

Brigham Young Univ., Provo, UT (USA). Combustion Lab.
Entrained flow gasification at elevated pressure: Quarterly technical progress report No. 7 for the period 1 September 1986 to 30 November 1986, 12:15281 (R;US)

Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering
Effects of coal structure on pulverized coal combustion processes: Quarterly technical progress report No. 5 for the period September 1, 1986 to 31 December 1986, 12:15303 (R;US)

British Gas Corp., London
Study of infra-red radiation characteristics: 2, Effect of infra-red radiation heating on the human body, 12:16883 (TG;GB)

British Geological Survey, Keyworth. Geothermal Resources Programme
Further investigations of the UK heat flow field (1981-1984). Investigation of the geothermal potential of the UK, 12:15628 (R;GB)
Heat flow and regional groundwater flow in the United Kingdom. Investigation of the geothermal potential of the UK, 12:15626 (R;GB)

Brookhaven National Lab., Upton, NY (USA)
Annealing of cold worked hypostoichiometric Ni_3Al alloys using positron lifetime spectroscopy, 12:16240 (R;US)
Applications of synchrotron x-ray fluorescence to extraterrestrial materials, 12:16535 (R;US)
Atomic physics and synchrotron radiation: The production and accumulation of highly charged ions, 12:17058 (R;US)
Brookhaven National Laboratory: Technology transfer report, Fiscal year 1983, 12:16158 (R;US)
Carboxyl group reactivity in actin, 12:16794 (R;US)
Computerized microtomography using synchrotron radiation from the NSLS [National Synchrotron Light Source], 12:16595 (R;US)
Design considerations for a combined synchrotron-light source and heavy-ion storage ring Atomic Physics Facility, 12:16533 (R;US)
Energy dependence of the neutron multiplicity P/sub nu/ in fast neutron induced fission of /sup 235,238/U and ^{239}Pu, 12:17239 (R;US)
Enhancement of coal quality by microbial demetalization and desulfurization, 12:15269 (R;US)
Evaluation of potential mixed wastes containing lead, chromium, used oil, or organic liquids, 12:15439 (R;US)
Experimental results on spin physics at the AGS, 12:17096 (R;US)
Hydrogen degradation of pipeline steels: Final report, 12:16242 (R;US)
In vivo determination of tibial lead by K x-ray fluorescence with a ^{109}Cd source, 12:16885 (R;US)
Liquefaction of natural gas to methanol for shipping and storage, 12:15589 (R;US)
Low temperature methanol process: The next step, 12:15588 (R;US)
Methanol for transportation of natural gas values, 12:15587 (R;US)
Modes of storage ring coherent instabilities, 12:16571 (R;US)
Modification of the properties of metal overlayers on Nb(110) and Ta(110), 12:16241 (R;US)
Quasar uncertainty study, 12:16004 (R;US)
Release of organic chelating agents from solidified decontamination wastes, 12:15408 (R;US)
Spin-waves in the uniaxial spin-glass system Fe/sub 1-x/Mg/sub x/Cl_2, 12:17337 (R;US)
SSI [soil-structure interactions] and structural benchmarks, 12:16005 (R;US)
Studies of aluminum in rat brain, 12:16884 (R;US)
Synthesizing seismic fragility of components by use of existing data, 12:16006 (R;US)
The fifth force, 12:17126 (R;US)

Thylakoid phosphoproteins, 12:15598 (R;US)
Trace element measurements using white synchrotron radiation, 12:16534 (R;US)
Uncertainties in scientific measurements, 12:17216 (R;US)
Brown Univ., Providence, RI (USA)
Global paleoclimatic data for 6000 yr B.P., 12:16692 (R;US)

Properties of colloidal corrosion products and their effects on nuclear plants: Final report, 12:15769 (R;US)
College of William and Mary, Williamsburg, VA (USA)
HALOE science investigation. Semiannual progress report, February-July 1986, 12:16705 (R;US)
Colorado State Univ., Fort Collins (USA). Collaborative Radiological Health Lab.
Collaborative Radiological Health Laboratory annual report 1985: health effects of prenatal and postnatal whole-body exposure to ionizing radiation in the beagle dog, 12:16860 (R;US)
Colorado Univ., Boulder (USA)
Reversible and irreversible redox series as probes of fundamental aspects of charge transfer across InP, WSe_2, and SnS_2/acetonitrile interfaces: Progress report, May 15, 1986-May 14, 1987, 12:16423 (R;US)
Comissao Nacional de Energia Nuclear de Brasil, Rio de Janeiro
Radioactive waste management in radioactive installations, 12:15412 (R;BR;In Portuguese)
Commission of the European Communities, Geel (Belgium). Central Bureau for Nuclear Measurements
Analysis of rare earths and cadmium in reference materials: Li_2SO_4 and $MnSO_4$, 12:16386 (R;FR)

^{235}Uranium isotope abundance certified reference material for gamma spectrometry EC nuclear reference material 171 certification report, 12:16389 (R;FR)

Commission of the European Communities, Ispra (Italy). Joint Research Centre

Monitoring of Plutonium Contaminated Solid Waste Streams. A technical guide to design and analysis of monitoring systems, 12:16385 (R;FR)

Commission of the European Communities, Luxembourg

Analysis of rare earths and cadmium in reference materials: Li_2SO_4 and $MnSO_4$, 12:16386 (R;FR)

Chemical behaviour of Np, Pu and Am in various concentrated salt solutions, 12:16429 (R;FR;In German)

Comparison of material property specifications of austenitic steels in fast breeder reactor technology, 12:16273 (R;FR)

Decontamination by water jet, chemical and electrochemical methods, 12:15772 (R;FR;In French)

Decontamination of some liquid wastes of medium activity with a new solvent type, 12:15427 (R;FR;In Italian)

EC static high-temperature leach test. Summary report of an European Community interlaboratory round robin, 12:16358 (R;FR)

Experimental study of the recovery of plutonium from non-combustible wastes, 12:15429 (R;FR)

High-temperature incineration of radioactive waste. Exploitation of the FLK-60 slagging incinerator for the treatment of different waste streams contaminated with plutonium, 12:15428 (R;FR)

Laser Induced Photoacoustic Spectroscopy for the oxidation specific determination of actinoids in solution, 12:16388 (R;FR;In German)

Measurements of transuranium trace amounts in solution. Bibliographic study, 12:16387 (R;FR;In French)

Monitoring of Plutonium Contaminated Solid Waste Streams. A technical guide to design and analysis of monitoring systems, 12:16385 (R;FR)

Processing of miscellaneous radioactive effluents by continuous flocculation decantation, 12:15426 (R;FR;In French)

Stress rupture properties of austenitic steel weld metals, 12:16271 (R;FR)

Survey of existing literature in the field of shock-absorbing materials with a view to subsequent adaptation of plastic deformation codes. Phase 1, 12:16442 (R;FR)

Tensile properties of austenitic steel weld metals, 12:16272 (R;FR)

^{235}Uranium isotope abundance certified reference material for gamma spectrometry EC nuclear reference material 171 certification report, 12:16389 (R;FR)

Commonwealth Scientific and Industrial Research Organization, Mount Waverley (Australia). Div. of Geomechanics

Numerical modelling of development roadways, German Creek Central Colliery, Central Queensland, 12:15320 (R;AU)

System for automatic monitoring of longwall supports at Angus Place colliery, 12:15321 (R;AU)

Commonwealth Scientific and Industrial Research Organization, Sydney (Australia)

Proceedings: 1985 international conference on coal science, 12:15267 (B;AU)

Connecticut Univ., Storrs (USA)

Energy transfer and non-linear optical properties at near ultraviolet wavelengths: Rare earth 4f → 5d transitions in crystals and glasses: Progress report for the period June 1, 1986 to May 31, 1987, 12:16353 (R;US)

Ground and excited state photoconductivity measurements of Ce^{3+}:YAG, 12:16352 (R;US)

UV laser induced photochromic centers in cerium doped calcium fluoride, 12:16351 (R;US)

Control Data Corp., Pleasanton, CA (USA)

Micro-to-Mainframe Communication Standard: Subsystem design analysis report, 12:17658 (R;US)

Council for Scientific and Industrial Research, Pretoria (South Africa). National Electrical Engineering Research Inst.

Battery-powered vehicle research in South Africa, 12:16233 (R;ZA)

D

Danmarks Tekniske Hoejskole, Lyngby

Electron cyclotron resonance heating of a high-density plasma, 12:17416 (R;DK)

Dartmouth Coll., Hanover, NH (USA). Dept. of Physics and Astronomy

High power, millimeter-wavelength, coherent radiation sources. Final report, 1 Februiary 1982-31 January 1986, 12:16487 (R;US)

Department of Atomic Energy, Bombay (India)

Annual report 1985-1986 [of the Department of Atomic Energy of the Government of India], 12:17636 (R;IN)

Department of Energy, London (UK). Wave Energy Steering Committee

Long spines with appendages. A report to the Wave Energy Steering Committee covering work supported by the United Kingdom Department of Energy, 12:15631 (R;GB)

Department of Transportation, Cambridge, MA (USA). Transportation Systems Center

National urban mass transportation statistics. 1983 Section 15 annual report. Transit financial and operating data reported for years ending between January 1, 1983 and December 31, 1983, 12:16210 (R;US)

National urban mass transportation statistics. 1981 Section 15 report. Transit financial and operating data reported for fiscal year ending between July 1, 1980 and June 30, 1981. Annual report, 12:16211 (R;US)

National urban mass transportation statistics. 1981 Section 15 report. Transit financial and operating data reported for fiscal year ending between July 1, 1980 and June 30, 1981. Supplement, 12:16212 (R;US)

National urban mass transportation statistics. 1982 Section 15 annual report. Transit financial and operating data reported for fiscal year ending between July 1, 1981 and June 30, 1982, 12:16214 (R;US)

National urban mass transportation statistics. Second annual report. Section 15 reporting system. Transit financial and operating data reported for fiscal year ending between July 1, 1979 and June 30, 1980, 12:16213 (R;US)

Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.)

Technology program 'Gas-cooled Solar Tower Plant' (GAST) - analysis of the potential. Final report, 12:15618 (R;DE;In German)

Deutsches Inst. fuer Wirtschaftsforschung, Berlin (Germany, F.R.)

Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary, 12:16153 (R;DE;In German)

Drexel Univ., Philadelphia, PA (USA). Dept. of Physics and Atmospheric Science

Non-accelerator particle physics: Progress report for period February 1, 1986-January 31, 1987, 12:17100 (R;US)

Duke Univ., Durham, NC (USA)

Nuclear interlevel transfer driven by collective outer shell electron oscillations, 12:17351 (R;US)

Photophysical studies of triplet exciton processes in pure polymer films: Technical progress report for the period February 1985-July 26, 1986, 12:16402 (R;US)
New Hampshire Univ., Durham (USA)
Gamma-ray spectrometer experiment on the solar maximum mission satellite. Final report, 16 October 1984-15 April 1986, 12:17041 (R;US)
New Mexico Univ., Albuquerque (USA). Dept. of Chemical and Nuclear Engineering
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
New Mexico Univ., Albuquerque (USA). New Mexico Research and Development Inst.
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
Niels Bohr Inst., Copenhagen (Denmark)
Chiral order parameter of Wilson fermion formulation in a lattice CP/sup N-1/ model, 12:17181 (R;DK)
Fragmentation of jets produced in hard p anti p collisions at the ISR, 12:17119 (R;DK)
Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)
Correlation functions for the clustering of galaxies and Abell clusters, 12:17045 (R;DK)
Cosmology and galaxy formation. An introduction to some recent ideas, 12:17048 (R;DK)
Early galactic evolution and the nature of the first stars, 12:17049 (R;DK)
Frequency dependent polarization in blazars, 12:17043 (R;DK)
Helioseismology, 12:17046 (R;DK)
Primordial shear and the question of inflation, 12:17047 (R;DK)
Propagator of quantum gravity in minisuperspace, 12:17387 (R;DK)
Solar oscillations, 12:17044 (R;DK)
North Carolina Central Univ., Durham (USA). Dept. of Physics
Plasma diagnostics: Detection of laser scattering: Final report, September 1, 1978 to August 31, 1982, 12:17400 (R;US)
North Carolina State Univ., Raleigh (USA)
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
North Dakota Univ., Grand Forks (USA). Energy Research Center
Low-rank coal research: Quarterly technical progress report for the period April-June 1986, 12:15310 (R;US)
Northeastern Univ., Boston, MA (USA). Dept. of Physics
Solving QCD using Monte Carlo Renormalization Group method, 12:17182 (R;US)
Northrop Services, Inc., Research Triangle Park, NC (USA)
Hydroxyl-radical rate-constant intercomparison study. Final report, 12:16718 (R;US)
Northwestern Univ., Evanston, IL (USA). Dept. of Physics
Theoretical studies of defects in binary and ternary oxides, 12:16329 (R;US)
Nuclear Energy Agency, 75 - Paris (France)
Two example applications of optimization techniques to radiation protection programmes of United States Department of Energy Contractors, 12:17333 (BA;XA)
Nuclear Fuel Inst., Zbraslav (Czechoslovakia)
Research of LWR [light water reactor] fuel rod behaviour under accident conditions, 12:16033 (R;XA)
Nuclear Regulatory Commission, Washington, DC (USA)
Flow visualization study of inverted U-bend two-phase flow, 12:16017 (R;US)
Release of organic chelating agents from solidified decontamination wastes, 12:15408 (R;US)
Nuclear Regulatory Commission, Washington, DC (USA). Div. of Accident Evaluation
The relationships and influences of fuel and coolant system processes during LWR severe accidents, 12:16061 (R;US)
Nuclear Regulatory Commission, Washington, DC (USA). Div. of Engineering Safety
Acoustic emission/flaw relationship for in-service monitoring of nuclear pressure vessels: Progress report, April 1986-September 1986, 12:15773 (R;US)
Nuclear Regulatory Commission, Washington, DC (USA). Div. of Reactor Systems Safety
An analytical and experimental investigation of natural circulation transients in a model pressurized water reactor, 12:15805 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Div. of Waste Management
Evaluation of potential mixed wastes containing lead, chromium, used oil, or organic liquids, 12:15439 (R;US)
Interpretative analysis of data for solute transport in the unsaturated zone, 12:15440 (R;US)
Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Material Safety and Safeguards
Standard format and content of a license application for a low-level radioactive waste disposal facility: Safety analysis report, 12:15435 (R;US)
Standard review plan for the review of a license application for a low-level radioactive waste disposal facility: Safety analysis report, 12:15436 (R;US)
Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation
Safety evaluation report related to the operation of Vogtle Electric Generating Plant, Units 1 and 2 (Docket Nos. 50-424 and 50-425), 12:16060 (R;US)
Technical specifications (Docket No. 50-400): Appendix "A" to License No. NPF-63, 12:15804 (R;US)
Technical specifications, Vogtle Electric Generating Plant, Unit No. 1 (Docket No. 50-424): Appendix "A" to license No. NPF-61, 12:15803 (R;US)
Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research
SSI [soil-structure interactions] and structural benchmarks, 12:16005 (R;US)
Nuclear Research Inst., Rez (Czechoslovakia)
Research of LWR [light water reactor] fuel rod behaviour under accident conditions, 12:16033 (R;XA)
Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)
Transient Tracers in the Oceans (TTO) hydrographic data and carbon dioxide systems, 12:16709 (R;US)
NUS Corp., Gaithersburg, MD (USA)
Alternative methods to manage waste salt from repository excavation in the Deaf Smith County and Swisher County locations, Texas: A scoping study: Technical report, 12:15407 (R;US)
Rail transportation corridor analysis report: Deaf Smith County location in the Palo Duro Basin, Texas, 12:15487 (R;US)
NWT Corp., San Jose, CA (USA)
Evaluation of sulfur hexafluoride and helium for steam generator leak location: Final report, 12:15771 (R;US)

O

Oak Ridge Associated Universities, Inc., TN (USA)
Electricity and the pulp and paper industry, 12:16218 (R;US)
Historically Black Colleges and Universities Radioactive Waste Management Research Program: Summary of activities, 1985-1986, 12:15424 (R;US)
IEA/ORAU long-term global energy-CO_2 model, 12:16700 (R;US)
Multistate EIA-857 respondent report 1984: Final report, 12:15366 (R;US)
Nuclear engineering, health physics, and radioactive waste management fellowship program: Summary of program activities: Nuclear engineering and health physics fellowship, 1985-1986, 12:15924 (R;US)
Nuclear engineering, health physics, and radioactive waste management fellowship program: Summary of program activities: Radioactive waste management fellowship, 1985-1986, 12:15423 (R;US)
Roles for electricity in transportation, 12:16209 (R;US)
Roles of electricity: Electric steelmaking, 12:16220 (R;US)
Roles of electricity: Pulp and papermaking, 12:16219 (R;US)
The role of electricity in glass making, 12:16217 (R;US)
Oak Ridge National Lab., TN (USA)
Americium product solidification and disposal, 12:15441 (R;US)
An experiment in combining estimates of uncertainty, 12:16913 (R;US)
Animal mortality resulting from uniform exposures to photon radiations: Calculated LD_{50}s and a compilation of experimental data, 12:16859 (R;US)
Assess the impact of the steep-front, short duration impulse on electric power system insulation: Phase 1, Final report, 12:15668 (R;US)
Assessment of ceramic composites for multimegawatt space nuclear power systems, 12:15867 (R;US)
Cleanup operations at the Oak Ridge Gaseous Diffusion Plant contaminated metal scrapyard, 12:15415 (R;US)
Confidence in technologies: Interactions between publics and industries, 12:16912 (R;US)
Consolidated Fuel Reprocessing Program: Progress report for period July 1 to September 30, 1986, 12:15389 (R;US)
Covariances of evaluated nuclear data based upon uncertainty information of experimental data and nuclear models, 12:17192 (R;US)
3-D world modeling with updating capability based on combinatorial geometry, 12:16440 (R;US)
Determining the extent, benefits, cost, and timing of utility conservation and load management programs, 12:16173 (R;US)
Drop tests of the Three Mile Island knockout canister, 12:15800 (R;US)
Ductility and fracture behavior of polycrystalline Ni_3Al alloys, 12:16264 (R;US)
Effect of aluminum addition on ductility and yield strength of Fe_3Al alloys with 0.5 wt % TiB_2, 12:16258 (R;US)
Energy division: Annual progress report for period ending September 30, 1982, 12:16154 (R;US)
Evaluating telerobotics for battlefield support operations, 12:16441 (R;US)
Evaluation of advanced materials for severe slurry erosion service: Final report, 12:15290 (R;US)
Excitations in small spherical particles, 12:17358 (R;US;In Spanish)
Flaw density examinations of a clad boiling water reactor pressure vessel segment, 12:15763 (R;US)
How to set up a successful production graphics facility, 12:17642 (R;US)
How well does ORIGEN predict spent LWR [Light Water Reactor] fuel characteristics, 12:15416 (R;US)
Induced magnetic form factor of $CeCu_6$, 12:17339 (R;US)
Liquid nitrogen cooling considerations of the Compact Ignition Tokamak, 12:17486 (R;US)
Maintenance features of the Compact Ignition Tokamak fusion reactor, 12:17432 (R;US)
Major world ecosystem complexes ranked by carbon in live vegetation: a database, 12:16710 (R;US)
Medical isotopes at Oak Ridge National Laboratory, 12:16811 (R;US)
Nuclear medicine: Progress report for quarter ending September 30, 1986, 12:16813 (R;US)
Nuclear Safety: Technical progress review, January-March 1987, 12:16063 (R;US)
Occupant evaluation of commercial office lighting: Volume 1, Methodology and bibliography, 12:16205 (R;US)
On the use of CORLIB subroutines for the solution of a model fluid flow problem, 12:17655 (R;US)
ORNL trends and balances, 1987-1992, 12:16160 (R;US)
PCMSOL: Simulation code for a passive solar structure incorporating phase change materials, 12:15622 (R;US)
Photon emission from irradiated solids: Proceedings of the Werner Brandt workshop on penetration phenomena, 12:17338 (R;US)
Quality assurance consideration for cement-based grout technology programs at Oak Ridge National Laboratory, 12:15414 (R;US)
Radioqensitometric tree-ring analysis along altitudinal gradients: Some alternative procedures for detecting site, climatic, and potential CO_2 effects on tree growth, 12:16773 (R;US)
Recovery of methane from combined industrial and municipal wastewater by anaerobic treatment, 12:15586 (R;US)
Representational issues in machine learning, 12:17641 (R;US)
Resource management plan for the Oak Ridge Reservation: Volume 24, Threatened and endangered animal species, 12:16782 (R;US)
Sensitivity analysis of ORION, 12:15362 (R;US)
Soft x-ray emission spectra of lithium fluoride excited by synchrotron radiation, 12:17353 (R;US)
Soft x-ray emission studies of several aluminum alloys, 12:16293 (R;US)
Stable isotope customer list and summary of shipments, FY 1986, 12:16408 (R;US)

The effects of heavy doping on the electronic states in semiconductors, 12:17340 (R;US)
The Integrated Data Base program: An executive-level data base of spent fuel and radioactive waste inventories, projections, and characteristics, 12:15417 (R;US)
The "ring killer" experiment: Electron confinement in the ELMO Bumpy Torus without the influence of hot-electron rings, 12:17415 (R;US)
Tree ring chronology indexes and reconstructions of precipitation in Central Iowa, USA, 12:16689 (R;US)
Upgrade of the GRESS (test version D) precompiler to allow triply-dimensioned arrays, 12:17654 (R;US)
Viscosity behavior in supercooled pure liquids and mixtures, 12:16407 (R;US)

Oesterreichische Akademie der Wissenschaften, Vienna
Recent results of μCF experiments at SIN [Swiss Institute For Nuclear Research], 12:17207 (R;US)

Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H.
Non-contacting thickness-gauging of fine steel plates, 12:15580 (R;AT;In German)

PERSONAL AUTHOR INDEX

Authors' surnames are indexed in the form appearing in the abstracted publication; given names are reduced to initials. Each author entry gives the publication title and the citation number. The document type, e.g., R for Report; country of publication, e.g., US; and language of the document, e.g., In German; are given in parentheses at the end of the entry. If no language statement appears, the language is English. Tables of document types and country of publication codes appear after the indexes. For publications with multiple authors, an entry is provided for each author. Entries for the second and succeeding authors give references to the first author.

Because of problems involved in the mechanical preparation of this index, all accent marks are omitted. Changes in spelling introduced as a result of accent omission follow standard conventions.

SUBJECT INDEX

The subject index is based on the use of subject descriptors selected from a controlled thesaurus of terms (DOE/TIC-7000). Subject descriptors and qualifiers (subheadings) are selected and presented in the following format:

SUBJECT DESCRIPTOR
Qualifier
Title, (supplementary information), citation number, (R;US)

The notations in the final parentheses indicate the type of document, e.g., R for Report; the country of publication, e.g., US; and the language if other than English, e.g., In German. Tables of document types and country of publication codes appear after the indexes.

The title may be supplemented with additional words, or a phrase, if it appears additional information would be helpful. In cases for which the title contains little or no information related to the subject entry, it may be replaced entirely by the supplementary information. A qualifier is not always required, and in such cases the title will follow the unqualified subject descriptor.

The descriptors selected for use as subject terms are generally the names of specific materials, things, or processes. To the extent possible, a qualifier is selected to describe the properties of, or processes applied to, the subject term.

Index entries are selected to indicate the important ideas and concepts presented in a document, rather than words that may appear in the text. Within the available thesaurus terms, the most probable or logical place to look for typical information is selected. "See references" are included to guide users from synonymous terms or phrases to the descriptor selected as a subject heading for the concept (e.g., Pipeline Quality Gas, see HIGH BTU GAS). "See also references" are used to indicate where to find references to subject concepts that are narrower, broader, or related to a particular subject heading. To complete an exhaustive search of a given subject, all such headings should be reviewed. Copies of DOE/TIC-7000, the Subject Thesaurus, are available from the National Technical Information Service (NTIS), U.S. Department of Commerce, Springfield, VA 22161.

ADONE
Operation
Status of ADONE as synchrotron radiation source, 12:16575 (RA;US)
AEROSOLS
See also SMOKES
Organic Compounds
Effects of organic impurities on the partitioning of iodine, 12:16105 (J;US)
AFRICA
See also SOUTH AFRICA
Deforestation
Continental and global scale remote sensing of land cover, 12:16779 (BA;US)
AIR
Corrosive Effects
Behavior of breached pressurized water reactor spent-fuel rods in an air atmosphere between 250 and 360°C, 12:15400 (J;US)
Mixing
Combustion-torch ignition: Fluorescence imaging of NO/sub 2/, 12:15369 (BA;US)
High-resolution coherent anti-Stokes Raman spectroscopy measurements of carbon monoxide linewidths in a flame, 12:15370 (BA;US)
Radionuclide Migration
TFTR offsite dose levels from fusion radiation and effluent releases, 12:17553 (J;US)
AIR POLLUTION
See also INDOOR AIR POLLUTION
Atmospheric Chemistry
Hanford 67-series: atmospheric field-diffusion measurements, micrometeorological and tracer data archive, Set 003 documentation report. Interim report, 12:16719 (R;US)
Data Processing
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species. Final report, period ending June 1986, 12:16706 (R;US)
Economic Impact
Results of 1984 architectural coatings sales survey. Final report, 12:16727 (R;US)
Environmental Effects
A review of the chemical record in lake sediment of energy related air pollution and its effects on lakes, 12:16733 (J;NL)
Environmental Impacts
Results of 1984 architectural coatings sales survey. Final report, 12:16727 (R;US)
Environmental Transport
Study including experiments on the diffusion emissions caused by accidents, 12:16711 (R;DE;In German)
Field Tests
Hanford 67-series: atmospheric field-diffusion measurements, micrometeorological and tracer data archive, Set 003 documentation report. Interim report, 12:16719 (R;US)
Mathematical Models
Atmospheric-dispersion index for prescribed burning. Forest Service research paper, 12:16728 (R;US)
Sensitivity analysis of RELMAP (Regional Lagrangian Model of Air Pollution) involving fine and coarse particulate matter, 12:16721 (R;US)
Measuring Methods
Hydroxyl-radical rate-constant intercomparison study. Final report, 12:16718 (R;US)
Report on the parallel ambient sampling project for selected organic toxics. Final report, 12:16722 (R;US)
Monitoring
Description of data on the Nimbus 7 LIMS map archive tape: ozone and nitric acid, 12:16707 (R;US)
Pollution Sources
Locating and estimating air emissions from sources of ethylene oxide, 12:16724 (R;US)
Remote Sensing
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species. Final report, period ending June 1986, 12:16706 (R;US)
AIR POLLUTION CONTROL
Use this term for items that involve the removal or management of pollutants after they are formed by a source.
Cost
A study on the systematic control of CO/sub 2/ emissions from fossil-fuel power plants in the U.S., 12:16730 (J;US)
Feasibility Studies
A study on the systematic control of CO/sub 2/ emissions from fossil-fuel power plants in the U.S., 12:16730 (J;US)
AIR POLLUTION MONITORING
Accuracy
Precision and accuracy assessments for state and local air-monitoring networks, 1984, 12:16720 (R;US)
Optical Spectrometers
Development of a coherent optical particle spectrometer for industrial applications: a feasibility investigation, 12:16725 (R;US)
Statistics
Air quality data - 1985 annual statistics including summaries with reference to standards. Annual report, 12:16712 (R;US)
AIR QUALITY
Standards
Air quality data - 1985 annual statistics including summaries with reference to standards. Annual report, 12:16712 (R;US)
Vinyl chloride standards: responses to comments on January 1985 proposed revisions, 12:16771 (R;US)
AIR SAMPLERS
Calibration
Atmospheric CO_2 concentrations Mauna Loa Observatory, Hawaii 1958-1983, 12:16708 (R;US)
AIRBORNE PARTICLES
See PARTICULATES
AIRBORNE PARTICULATES
See PARTICULATES
AIRCRAFT ACCIDENTS
See ACCIDENTS
ALANINES
Chemical Preparation
Design and evaluation of new ruthenium labeled radiopharmaceuticals for the pancreas and heart, 12:16818 (J;US)
Labelling
Design and evaluation of new ruthenium labeled radiopharmaceuticals for the pancreas and heart, 12:16818 (J;US)

ALAP
See RADIATION PROTECTION
ALARM DOSEMETERS
See RADIATION MONITORS
ALBITE
Dissolution
Dependence of albite dissolution kinetics on pH and time at 25°C and 70°C, 12:16928 (J;US)
Solubility
Experimental investigations of the reaction between albite and acid hydrothermal solutions, 12:15629 (R;DE;In German)
ALCATOR DEVICE
Superconducting Magnets
Sliding joint and bond development program for the Alcator C-Mod toroidal field coils, 12:17608 (J;US)
ALDEHYDES
See also FORMALDEHYDE
Forecasting
Calculation of emission scenarios for passenger cars in the Netherlands, 12:16208 (R;NL;DU)
ALDEHYDO ACIDS
See ALDEHYDES
ALGAE
Biological Adaptation
Sheath pigment formation in a blue-green algae lyngbya aestuarii as an adaptation to high light, 12:16832 (RA;US)
Screening
Microalgae culture collection, 1986-1987, 12:15613 (R;US)
Storage
Microalgae culture collection, 1986-1987, 12:15613 (R;US)
ALKALI METAL COMPOUNDS
See also LITHIUM COMPOUNDS
POTASSIUM COMPOUNDS
Removal
Study of high temperature removal of alkali of a pressurized gasification system: Final report, 12:15276 (R;US)
ALKALI METALS
See also CESIUM
LITHIUM
POTASSIUM
RUBIDIUM
SODIUM
Atom-Atom Collisions
Asymmetric scattering in thermal collisions of alkali (/sup 2/P/sub 3/2/)-atoms with rare gas atoms: Na(3/sup 2/P/sub 3/2/) and K(4/sup 2/P/sub 3/2/) with Ne, Ar and Kr, 12:17079 (RA;CS)
ALKALINE FLOODING
See CAUSTIC FLOODING
ALKENES
See also BUTENES
Synthesis
Synthesis and modification of zeolite catalysts for producing short-chain olefins from methanol and synthesis gas, 12:16405 (R;DE;In German)
ALKINES
See ALKYNES
ALKYNES
Chemical Preparation
Formation of long carbon chain molecules during laser vaporization of graphite, 12:16424 (J;US)
ALLOY-D-9
Fuel Cans
Performance of liquid metal reactor fuel pins with D9 cladding, 12:15853 (R;US)
ALLOY-HD-8077
See NICKEL BASE ALLOYS
ALLOY-HT-9
Corrosion Products
FLiBe-vanadium alloy system corrosion product radiation hazards analysis, 12:17576 (J;US)
Creep
Design limits for HT9 cladding using stress-induced aging data, 12:15855 (R;US)
Fuel Cans
Design limits for HT9 cladding using stress-induced aging data, 12:15855 (R;US)
Physical Radiation Effects
FLiBe-vanadium alloy system corrosion product radiation hazards analysis, 12:17576 (J;US)
Stresses
Design limits for HT9 cladding using stress-induced aging data, 12:15855 (R;US)

Corrosion
Advanced metal alloys for energy needs, 12:16319 (BA;US)
Corrosion Resistance
The corrosion of metals and alloys by sodium polysulfide melts at 350°C, 12:16253 (R;US)
Oxidation
Advanced metal alloys for energy needs, 12:16319 (BA;US)
Physical Radiation Effects
Formation of submicron metastable phase structures in alloys with focused electron or proton beams, 12:16261 (R;US)
Production of freely-migrating defects during irradiation, 12:16250 (R;US)
Surface Treatments
Formation of submicron metastable phase structures in alloys with focused electron or proton beams, 12:16261 (R;US)
Temperature Effects
Fuel system and structural alloy considerations for space nuclear reactor systems, 12:15868 (BA;US)
ALLOY-WAZ-16
See NICKEL BASE ALLOYS
ALPHA DETECTION
Nuclear Emulsions
Sandwich nuclear emulsion emitter-detector-emitter systems with regulated sensitivity, 12:16607 (R;SU;In Russian)
Si Semiconductor Detectors
Detection of charged particles in amorphous silicon layers, 12:16655 (J;NL)
ALPHA PARTICLES
Emitted by nuclei.
See also SOLAR ALPHA PARTICLES
Correlations
Multiplicity dependent light particle correlations in $^{40}Ar + ^{197}Au$ reaction at E/A = 60 MeV°, 12:17236 (R;FR)
Distribution Functions
An alpha particle distribution function for mirror loss-cone type instability calculations, 12:17419 (J;US)
Microdosimetry
Alpha-particle dose distribution effects at the cellular level, 12:16871 (RA;US)
ALPHA REACTIONS
Nuclear Fireball Model
Excitation of target residues in the firestreak model, 12:17289 (R;SU)
Nuclear Reaction Yield
Excitation of target residues in the firestreak model, 12:17289 (R;SU)

ALPHA-BEARING WASTES
Calcination
High-temperature incineration of radioactive waste. Exploitation of the FLK-60 slagging incinerator for the treatment of different waste streams contaminated with plutonium, 12:15428 (R;FR)
Gamma Spectroscopy
Test unit for measurement of small masses of alpha wastes, 12:15409 (R;FR;In French)
Inventories
The Integrated Data Base program: An executive-level data base of spent fuel and radioactive waste inventories, projections, and characteristics, 12:15417 (R;US)
Nondestructive Analysis
Monitoring of Plutonium Contaminated Solid Waste Streams. A technical guide to design and analysis of monitoring systems, 12:16385 (R;FR)
Radiation Monitoring
Monitoring of Plutonium Contaminated Solid Waste Streams. A technical guide to design and analysis of monitoring systems, 12:16385 (R;FR)
ALTERNATE FUELS
See SYNTHETIC FUELS
ALTERNATORS
Computerized Control Systems
Optimizing output of a wind-driven alternator using microprocessor control, 12:15652 (BA;US)
Design
Optimizing output of a wind-driven alternator using microprocessor control, 12:15652 (BA;US)
ALUMINATES
Specific compounds, except those of significance to energy research and development, should be indexed by coordination of a descriptor of the form (CATION) COMPOUNDS and the above anion descriptor.
Physical Radiation Effects
Irradiation damage in γ-$LiAlO_2$, 12:16326 (R;FR)
Irradiation devices for fusion reactor materials results obtained from irradiated lithium aluminate at the OSIRIS reactor, 12:17429 (R;FR)
Study of a breeding material - γ lithium aluminate, 12:17428 (R;FR)
ALUMINIA
See ALUMINIUM OXIDES
ALUMINIUM
Crystal Structure
A study of the equilibrium vacancy ensemble in aluminum using 1D- and 2D-angular correlation of annihilation radiation, 12:16307 (BA;US)
Electrodeposition
Electroforming with nickel, iron, and aluminum, 12:16298 (R;US)
Emission Spectroscopy
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Friction Welding
Inertia friction welding of 1100 aluminum to type 316 stainless steel, 12:16295 (R;US)
Ion Beam Injection
Surface modification of solids, 12:16317 (BA;US)
Laser Beam Machining
Surface modification of solids, 12:16317 (BA;US)
Oxidation
Spin polarized photoelectron studies of magnetism in solids: Progress report for period June 1, 1986-May 31, 1987, 12:16265 (R;US)
Physical Radiation Effects
Laser generation of particles to simulate aerosols from fusion systems, 12:17552 (J;US)
Surface Contamination
Contamination of aluminum and painted surfaces exposed to tritium, 12:17551 (J;US)
Laser generation of particles to simulate aerosols from fusion systems, 12:17552 (J;US)
Surface Properties
Simulation studies for surfaces and materials strength. Semiannual report, 1 May-31 October 1986, 12:16290 (R;US)
Surface Treatments
Surface modification of solids, 12:16317 (BA;US)
Vacancies
A study of the equilibrium vacancy ensemble in aluminum using 1D- and 2D-angular correlation of annihilation radiation, 12:16307 (BA;US)
ALUMINIUM ALLOYS
See also ALUMINIUM BASE ALLOYS
Annealing
Annealing of cold worked hypostoichiometric Ni_3Al alloys using positron lifetime spectroscopy, 12:16240 (R;US)
Ductility
Ductility and fracture behavior of polycrystalline Ni_3Al alloys, 12:16264 (R;US)
Fracture Properties
Ductility and fracture behavior of polycrystalline Ni_3Al alloys, 12:16264 (R;US)
Grain Growth
Small angle X-ray scattering (SAXS) study of coarsening kinetics in an aluminum-lithium alloy, 12:16304 (J;US)
Microstructure
Small angle X-ray scattering (SAXS) study of coarsening kinetics in an aluminum-lithium alloy, 12:16304 (J;US)
Physical Properties
Low temperature properties of $CeCu_6$ and related compounds, 12:16285 (R;US)
Physical Radiation Effects
Formation of submicron metastable phase structures in alloys with focused electron or proton beams (Ni-Al), 12:16261 (R;US)
Surface Treatments
Formation of submicron metastable phase structures in alloys with focused electron or proton beams (Ni-Al), 12:16261 (R;US)
Tensile Properties
Effect of aluminum addition on ductility and yield strength of Fe_3Al alloys with 0.5 wt % TiB_2, 12:16258 (R;US)
Valence
Valence instabilities in amorphous rare earth compound films, 12:16303 (J;NL)
X-Ray Spectra
Soft x-ray emission studies of several aluminum alloys, 12:16293 (R;US)
ALUMINIUM BASE ALLOYS
Rolling
The effect of the cube texture component on the earing behavior of rolled f.c.c. metals, 12:16283 (R;US)
Texture
The effect of the cube texture component on the earing behavior of rolled f.c.c. metals, 12:16283 (R;US)
ALUMINIUM COMPOUNDS
See also ALUMINATES
ALUMINIUM OXIDES
Biological Effects
Studies of aluminum in rat brain, 12:16884 (R;US)
Chemical Properties
Forms in which aluminium is bound and equilibria of aluminium in gravitational water in acid soils, 12:16775 (R;DE;In German)
Environmental Effects
Investigations in the toxic effect of H ions and Al ions on seedlings of spruce (Picea abies, KARST.) and beech (Fagus sylvatica, L.) in a solution culture, 12:16903 (R;DE;In German)
Toxicity
Investigations in the toxic effect of H ions and Al ions on seedlings of spruce (Picea abies, KARST.) and beech (Fagus sylvatica, L.) in a solution culture, 12:16903 (R;DE;In German)
ALUMINIUM OXIDES
See also CORUNDUM

Catalytic Effects
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Final quarterly technical progress report No. 4 for the period 1 July to 30 September 1986, 12:15284 (R;US)
Dispersion Hardening
Transformation toughening in the $Al_2O_3Cr_2O_3$ /ZrO_2 - HPO_2 system: the effect of ZrO_2-HFO_2 content, 12:16337 (BA;US)
Erosion
Erosion damage in glass and alumina, 12:16330 (R;US)
Fracture Properties
Transformation toughening in the $Al_2O_3Cr_2O_3$ /ZrO_2 - HPO_2 system: the effect of ZrO_2-HFO_2 content, 12:16337 (BA;US)
Physical Radiation Effects
Use of ion channeling axial scans in the study of ion-implanted Al_2O_3, 12:16341 (J;US)
Structural Chemical Analysis
Spin polarized photoelectron studies of magnetism in solids: Progress report for period June 1, 1986-May 31, 1987, 12:16265 (R;US)
Thermodynamic Properties
Thermodynamic performance of ceramic tritium breeding blanket material, 12:17580 (J;US)

ALUMINUM
See ALUMINIUM

ALVEOLI (PULMONARY)
See LUNGS

AMBIENT TEMPERATURE
Monthly Variations
Geographical distribution and seasonality of persistence in monthly mean air temperatures over the United States, 12:16697 (J;US)

AMERICIUM
Ion Exchange Chromatography
High-sensitive and quantitative in-line monitoring method for transplutonium elements separation processes, 12:15382 (R;CN;In Chinese)
Radioactive Waste Processing
Americium product solidification and disposal, 12:15441 (R;US)
Solidification
Americium product solidification and disposal, 12:15441 (R;US)

AMERICIUM 241
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)

AMERICIUM 243
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)

AMERICIUM COMPOUNDS
See also AMERICIUM OXIDES
Absorption Spectroscopy
Laser Induced Photoacoustic Spectroscopy for the oxidation specific determination of actinoids in solution, 12:16388 (R;FR;In German)

AMERICIUM OXIDES
Chemical Properties
Chemical behaviour of Np, Pu and Am in various concentrated salt solutions, 12:16429 (R;FR;In German)

AMINES
See also ANILINE
DOPAMINE
NITROSAMINES
RHODAMINES
Chemical Reactions
ESR studies on the radical cation mechanism of the ring opening of cyclopropylamines, 12:16411 (J;US)

AMINO ALCOHOLS

AMINOBENZENE
See ANILINE

AMINOGLYCIDES
See AMINES

AMMONIA
Chemical Reactions
Gas-phase chemical reactions of transition metal clusters with simple molecules, 12:16401 (R;US)

AMPHETAMINES
Prior to April 1981, this concept was indexed to BENZEDRINE.
Therapeutic Uses
Some factors affecting the uptake of iodoamphetamine (IAMP), 12:16824 (J;US)
Tissue Distribution
Some factors affecting the uptake of iodoamphetamine (IAMP), 12:16824 (J;US)
Uptake
Some factors affecting the uptake of iodoamphetamine (IAMP), 12:16824 (J;US)

AMPLIFIERS
Control Systems
Log amplifier with pole-zero compensation, 12:16494 (P;US)
Electronic Circuits
Log amplifier with pole-zero compensation, 12:16494 (P;US)

ANALOG RESONANCES
See ISOBARIC ANALOGS

ANALOG STATES
See ISOBARIC ANALOGS

ANALOG SYSTEMS
Performance
Parity simulation for nuclear plant analysis, 12:15928 (J;US)

ANALOG-TO-DIGITAL CONVERTERS
Analog-to-digital converter, 12:16631 (R;SU;In Russian)

ANALYSIS (ACTIVATION)
See ACTIVATION ANALYSIS

ANEMOMETERS
Design
A low cost and easy to reproduce anemometer for basic wind data acquisition, 12:15633 (BA;US)
Operation
A low cost and easy to reproduce anemometer for basic wind data acquisition, 12:15633 (BA;US)

ANHARMONIC OSCILLATORS
Feynman Path Integral
Approximate calculation of the conditional Wiener integral in quantum mechanics problem. Anharmonic oscillator, 12:17381 (R;SU;In Russian)

ANILINE
Biological Accumulation
Uptake and fate of xenobiotics in plants, 12:16891 (RA;US)
Root Absorption
Uptake and fate of xenobiotics in plants, 12:16891 (RA;US)

ANIMAL CELLS
Includes human cells.
See also CHO CELLS
Counting Techniques
Determination of bacterial cell volume with the coulter counter (Escherichia coli), 12:16800 (J;US)
Volume
Determination of bacterial cell volume with the coulter counter (Escherichia coli), 12:16800 (J;US)

ANIMAL FEEDS
Radiosterilization
Changes due to radiation or thermal sterilization in vitamin A level, acidity number and peroxide value of various fats in mixes with cereals, 12:16846 (RA;CS;In Czech)
Radiation processing technology for feed mixes and litter for laboratory animals, 12:16847 (RA;CS;In Czech)

ANIONS

Climates
Core processing and first analysis of ice cores from Siple and South Pole stations, 12:16767 (J;US)
ANTHRACITE
Quantitative Chemical Analysis
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
ANTIFERROMAGNETIC MATERIALS
Heisenberg Model
Monte Carlo study of anisotropic Heisenberg chain with spin 1, 12:17347 (R;JP)
Monte Carlo Method
Monte Carlo study of anisotropic Heisenberg chain with spin 1, 12:17347 (R;JP)
One-Dimensional Calculations
The spatial dependence of spin and charge correlations in a one-dimensional, single impurity, Anderson model, 12:17350 (R;US)
Spin Waves
Spin-waves in the uniaxial spin-glass system Fe/sub 1-x/Mg/sub x/Cl_2 (Fe/sub 1-x/Mg/sub x/Cl_2 for x = 0.3, 0.45 and 0.6), 12:17337 (R;US)
ANTILAMBDA PARTICLES
Particle Production
Hyperon-antihyperon production studies near threshold at LEAR, 12:17098 (R;US)
ANTIMONY
Emission Spectroscopy
Quality of leachate from retorted oil shale wetted with treated process waters, 12:15375 (R;US)
ANTIMONY ALLOYS
Electronic Structure
Magnetization density of 5 f electrons in ferromagnetic PuSb, 12:16313 (J;US)
Magnetization
Magnetization density of 5 f electrons in ferromagnetic PuSb, 12:16313 (J;US)
ANTINEUTRINO-NEUTRON INTERACTIONS
Deep Inelastic Scattering
Anti νn and anti νp interactions in neon nucleus: total cross section ratio and quark-parton analysis, 12:17115 (R;SU)
Experimental comparison of EMC effect in the anti νn and anti νp interactions in neon nucleus, 12:17114 (R;SU)
ANTINEUTRINO-PROTON INTERACTIONS
Deep Inelastic Scattering
Anti νn and anti νp interactions in neon nucleus: total cross section ratio and quark-parton analysis, 12:17115 (R;SU)
Experimental comparison of EMC effect in the anti νn and anti νp interactions in neon nucleus, 12:17114 (R;SU)
ANTINUCLEONS
Annihilation
Heavy ion collisions, the quark-gluon plasma and antinucleon annihilation, 12:17125 (R;IN)
APARTMENT BUILDINGS
Ventilation
Ventilation and occupant behavior in two apartment buildings, 12:16203 (R;US)
APPLICATORS (RADIOTHERAPY)
See RADIATION SOURCES
AQUATIC ECOSYSTEMS
Radionuclide Migration
Chemical behaviour of plutonium in natural aquatic systems: Hydrolysis, carbonate complexation and redox reactions, 12:16431 (R;DE;In German)
ARGENTINA
Nuclear Power
Financial problems of nuclear programmes. The experience of Argentina, 12:15891 (RA;XA)
ARGON
Ionization
Multiple target ionization by proton impact, 12:17319 (RA;US)
ARGON 38
Secondary Beams
Production of secondary radioactive beams from 44 MeV/u Ar projectiles, 12:16559 (R;FR)
ARGON 39
Secondary Beams
Production of secondary radioactive beams from 44 MeV/u Ar projectiles, 12:16559 (R;FR)
ARGON 40 REACTIONS
Multiplicity
Multiplicity dependent light particle correlations in ^{40}Ar + ^{197}Au reaction at E/A = 60 MeV°, 12:17236 (R;FR)
ARGONNE NATIONAL LABORATORY
See ANL
ARGONNE SUPERCONDUCTING LINAC
See ATLAS SUPERCONDUCTING LINAC
AROMATIC COMPOUNDS
See AROMATICS
AROMATICS
See also ANILINE
BENZENE
PHENOLS
POLYCYCLIC AROMATIC HYDROCARBONS
TETRALIN
Biodegradation
Preliminary investigation of organisms capable of degrading dieldrin and aromatic compounds: techniques for isolation and characterization, 12:16830 (RA;US)
Oxidation
The cogeneration of electrical energy and useful chemicals in a solid electrolyte reactor [Final technical report] (Ethylbenzene), 12:16420 (R;US)
ARRAY PROCESSORS
Algorithms
Optimizing matrix operations on a parallel multiprocessor with a hierarchical memory system, 12:17669 (BA;US)
Computer Architecture
A communication model for optimizing hierarchical multiprocessor systems, 12:17667 (BA;US)
Optimizing matrix operations on a parallel multiprocessor with a hierarchical memory system, 12:17669 (BA;US)
Vector processing on the Alliant FX/8 multiprocessor, 12:17663 (BA;US)
Computerized Simulation
A communication model for optimizing hierarchical multiprocessor systems, 12:17667 (BA;US)
Data Transmission
A communication model for optimizing hierarchical multiprocessor systems, 12:17667 (BA;US)
Executive Codes
Operating systems and basic software for high-performance parallel architecture, 12:17679 (BA;US)
I. Codes
Speedup bounds and processor allocation for parallel programs on multiprocessors, 12:17662 (BA;US)
Memory Devices
A compiler-assisted cache coherence solution for multiprocessors, 12:17661 (BA;US)
Parallel Processing
Speedup bounds and processor allocation for parallel programs on multiprocessors, 12:17662 (BA;US)
Translators
A compiler-assisted cache coherence solution for multiprocessors, 12:17661 (BA;US)
Vector Processing
Optimizing matrix operations on a parallel multiprocessor with a hierarchical memory system, 12:17669 (BA;US)
Vector processing on the Alliant FX/8 multiprocessor, 12:17663 (BA;US)

ARSENIC
Emission Spectroscopy
Quality of leachate from retorted oil shale wetted with treated process waters, 12:15375 (R;US)
Geochemistry
Arsenic distributions in porewaters and sediments of Puget Sound, Lake Washington, the Washington coast and Saanich Inlet, B.C., 12:16929 (J;US)
ARTERIES
Positron Computed Tomography
Radiopharmaceutical delivery system for controlled arterial concentration in physiologic modeling with computed tomography, 12:16822 (J;US)
ARTIFICIAL INTELLIGENCE
Representational issues in machine learning, 12:17641 (R;US)
ASBESTOS
Indoor Air Pollution
Assessment of assay methods for evaluating asbestos abatement technology at the Corvallis Environmental Research Laboratory, 12:16716 (R;US)
ASDEX TOKAMAK
Plasma Diagnostics
Evolution of radiation power profiles in ASDEX H-mode discharges, 12:17407 (R;DE)
Power Losses
Evolution of radiation power profiles in ASDEX H-mode discharges, 12:17407 (R;DE)
ASHES
See also FLY ASH
Agglomeration
Fundamental studies on mineral matter behavior in ash-agglomerating coal gasifiers, 12:15271 (R;US)
The U-GAS process for producing gas from coal, 12:15275 (R;US)
Chemical Composition
Identification of the physical and chemical characteristics of volcanic hazards, 12:16930 (J;US)
Pilot plant evaluation of Illinois No. 6 and Pittsburgh No. 8 coal for the Texaco coal gasification process: Final report, 12:15288 (R;US)
Evaporation
The mechanism of particulate adhesion in coal-fired gas turbine systems, 12:15679 (R;US)
Vapor Condensation
The mechanism of particulate adhesion in coal-fired gas turbine systems, 12:15679 (R;US)
Waste Product Utilization
Physical properties of cultivated soils mixed with coal ash as ameliorant, 12:15309 (R;JP;In Japanese)
ASPENS
Photosynthesis
Seasonal patterns of leaf photosynthetic capacity in successional northern hardwood tree species, 12:16805 (J;US)
ASTEROIDS
Chemical Composition
Continued program of planetary study at the University of Texas McDonald Observatory, 12:16988 (RA;US)
Physical properties of asteroids, 12:17015 (RA;US)
Cosmic Dust
Planetary optical and infrared imaging, 12:17022 (RA;US)
Cyanides
Planet-crossing asteroids: interrelationships within the solar system, 12:17010 (RA;US)
Infrared Spectra
Asteroid team, 12:17009 (RA;US)
Infrared spectral studies of asteroids, 12:16996 (RA;US)
Physical properties of asteroids, 12:17015 (RA;US)
Planetary spectroscopy, 12:17005 (RA;US)
Interferometry
Speckle interferometry applied to asteroids and other solar system objects, 12:17004 (RA;US)
Maps
Studies of asteroids and comets, 12:16997 (RA;US)
Origin
Origin of asteroids and small bodies, 12:17016 (RA;US)
Physical Properties
Physical properties of asteroids, 12:17015 (RA;US)
Speckle interferometry applied to asteroids and other solar system objects, 12:17004 (RA;US)
Spectra
Observations of comets and asteroids, 12:16994 (RA;US)
Spin
Cometary dynamics, 12:17018 (RA;US)
Surveys
Research in planetary astronomy at Palomar Observatory, 12:16990 (RA;US)
Thermal Radiation
Infrared observations of small solar-system bodies, 12:17001 (RA;US)
Volatility
Cometary dynamics, 12:17018 (RA;US)
ASTROPHYSICS
Magnetohydrodynamics
Astrophysical dynamo, 12:17088 (RA;CS)
Plasma Macroinstabilities
Trends in physics 1984. Proceedings of the 6th general conference of the European Physical Society. Volume 1, 12:16944 (R;CS)
ATLANTIC OCEAN
See also SOUTH ATLANTIC BIGHT
Geochemical Surveys
Distributions of dissolved calcium and alkalinity in the Weddell Sea in winter, 12:16932 (J;US)
ATLAS SUPERCONDUCTING LINAC
Argonne Tandem/Linac Accelerator.
Beam Injection
The ATLAS Positive-Ion Injector project, 12:16541 (R;US)
Operation
ATLAS accelerator laboratory report, 12:16508 (R;US)
ATMOSPHERIC CIRCULATION
Computerized Simulation
Inclusion of the ocean breeze in Oyster Creek emergency off-site dose assessment, 12:16074 (J;US)
P Codes
Field evaluation of an emergency response atmospheric dispersion model, 12:16769 (J;US)
ATMOSPHERIC PRECIPITATIONS
Aerosols
Measuring dry deposition: a re-assessment of the state-of-the-art, 12:16731 (J;NL)
Gases
Measuring dry deposition: a re-assessment of the state-of-the-art, 12:16731 (J;NL)
Measuring Methods
Measuring dry deposition: a re-assessment of the state-of-the-art, 12:16731 (J;NL)
Particles
Measuring dry deposition: a re-assessment of the state-of-the-art, 12:16731 (J;NL)
Tritium
Tritium content of precipitation and surface water in Austria in 1985, 12:16791 (R;AT;In German)
ATOM COLLISIONS
See also ATOM-ATOM COLLISIONS
ATOM-MOLECULE COLLISIONS
ION-ATOM COLLISIONS
Mathematical Models
Simulation studies for surfaces and materials strength. Semiannual report, 1 May-31 October 1986, 12:16290 (R;US)
ATOM-ATOM COLLISIONS
Differential Cross Sections
Differential cross-sections of fine structure transitions in K (4P) - He, Ar collisions, 12:17063 (R;FR)
Electric Fields
Influence of an external electric field on thermal collisions between circular Rydberg-state atoms and ground-state helium, 12:17061 (R;FR)
ATOMIC BOMBS
See NUCLEAR WEAPONS
ATOMIC ENERGY
See NUCLEAR ENERGY
ATOMIC EXPLOSIONS

ATOMIC MODELS
Computer Codes
Computer codes for treatment of highly excited atomic states, 12:17660 (RA;DD;In German)
Electronic Structure
Computer codes for treatment of highly excited atomic states, 12:17660 (RA;DD;In German)
Excitation
Computer codes for treatment of highly excited atomic states, 12:17660 (RA;DD;In German)
ATOMIC PHYSICS
Use only for indexing articles of very broad coverage, such as annual reviews, text books, etc.
Meetings
Atomic physics 9, 12:17085 (B;SG)
Scientific Personnel
Committee on Atomic and Molecular Sciences: Technical progress report for the period February 1, 1986-January 31, 1987, 12:17069 (R;US)
ATOMIC WEAPONS
See NUCLEAR WEAPONS
ATOM-MOLECULE COLLISIONS
Cross Sections
Quantum-mechanical study of fine-structure transitions in collisions of Rb(5²Psub(j)) with H_2 and D_2, 12:17064 (R;FR)
Inelastic Scattering
Time of flight experiments of the and H/sup +/ scattered from molecules and solid surfaces, 12:17072 (RA;CS)
Photochemistry
Molecular beam studies and quantum chemistry of elementary photochemical processes: electronic to vibrational energy transfer, 12:17078 (RA;CS)
ATOMS
Resonance Ionization Mass Spectroscopy
High efficiency direct detection of ions from resonance ionization of sputtered atoms, 12:16396 (P;US)
ATP-ASE
Code numbers 3.6.1.3 and 3.6.1.8.
Enzyme Activity
Auxin regulation of a proton translocating ATPase in pea root plasma membrane vesicles (Pisum sativum. L.), 12:16808 (J;US)
ATUCHA REACTOR
Lima, Buenos Aires, Argentina
Operation
Experience with Atucha I Nuclear Power Plant, both as regards technology transfer arrangements and operational experience, 12:15873 (RA;XA)
Technology Transfer
Experience with Atucha I Nuclear Power Plant, both as regards technology transfer arrangements and operational experience, 12:15873 (RA;XA)
ATUCHA-1 REACTOR
See ATUCHA REACTOR
ATWS
Anticipated transients without scram.
Computerized Simulation
Analysis of MSIV-ATWS events with the BNL plant analyzer, 12:16091 (J;US)
Heat Transfer
Analysis of MSIV-ATWS events with the BNL plant analyzer, 12:16091 (J;US)
Correlation for predicting reactor power during a BWR ATWS, 12:16133 (J;US)
Hydraulics
Analysis of MSIV-ATWS events with the BNL plant analyzer, 12:16091 (J;US)
Correlation for predicting reactor power during a BWR ATWS, 12:16133 (J;US)
AUGER ELECTRON SPECTROSCOPY
Uses
XPS [x-ray photoelectron spectroscopy], AES [Auger electron spectroscopy], RBS [Rutherford backscattering spectroscopy], NRA [nuclear reaction analysis] and laser Raman studies of high temperature corrosion, 12:16294 (R;US)
AUSTENITIC STEELS
Prior to February, 1978 STEELS and AUSTENITE were used to index this concept.
Fracture Properties
Stress rupture properties of austenitic steel weld metals, 12:16271 (R;FR)
Specifications
Comparison of material property specifications of austenitic steels in fast breeder reactor technology, 12:16273 (R;FR)
Tensile Properties
Tensile properties of austenitic steel weld metals, 12:16272 (R;FR)
AUSTRALIA

AUTOMOBILES
Exhaust Gases
Calculation of emission scenarios for passenger cars in the Netherlands, 12:16208 (R;NL;DU)
AUTOMOTIVE FUELS
Compressed Gases
Technology and market assessment of gas-fueled vehicles in New York State, 12:16229 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 1. Executive summary. Final report, 12:16230 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 2. Technology and economic assessment. Final report, 12:16231 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 3. Institutional barriers and market assessment. Final report, 12:16232 (R;US)
Liquefied Natural Gas
Technology and market assessment of gas-fueled vehicles in New York State, 12:16229 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 1. Executive summary. Final report, 12:16230 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 2. Technology and economic assessment. Final report, 12:16231 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 3. Institutional barriers and market assessment. Final report, 12:16232 (R;US)
Liquefied Petroleum Gases
Technology and market assessment of gas-fueled vehicles in New York State, 12:16229 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 1. Executive summary. Final report, 12:16230 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 2. Technology and economic assessment. Final report, 12:16231 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 3. Institutional barriers and market assessment. Final report, 12:16232 (R;US)
AUXILIARY WATER SYSTEMS
Decontamination
Decontamination by water jet, chemical and electrochemical methods, 12:15772 (R;FR;In French)
AUXINS
Biochemical Reaction Kinetics
Auxin regulation of a proton translocating ATPase in pea root plasma membrane vesicles (Pisum sativum. L.), 12:16808 (J;US)
AXIONS
Particle Decay
Cosmic axion decay to photons in the microwave and infrared regions, 12:17056 (BA;NL)

Particle Identification
Invisible axion detectors, 12:17055 (BA;NL)
Particle Properties
Cosmic axion decay to photons in the microwave and infrared regions, 12:17056 (BA;NL)

B

B MESONS
Particle Decay
Heavy flavors, 12:17155 (R;US)
Weak Particle Decay
CP violation in heavy flavor decays: Predictions and search strategies, 12:17157 (J;NL)
BACTERIA

BARC
Research Programs
Water Chemistry Division Progress Report, April 1983-April 1985, 12:16399 (R;IN)
BARIUM
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Quality of leachate from retorted oil shale wetted with treated process waters, 12:15375 (R;US)
Geochemistry
Geochemistry of Ca, Sr, Ba and Ra sulfates in some deep brines from the Palo Duro basin, Texas, 12:15350 (J;US)
Solubility
Evaluation of Synroc-C as a second generation waste form, 12:15446 (R;US)
BARIUM 137
Resonance Ionization Mass Spectroscopy
Continuous wave double-resonance ionization and laser-enhanced electron impact ionization, 12:16393 (RA;US)
Yields
Continuous wave double-resonance ionization and laser-enhanced electron impact ionization, 12:16393 (RA;US)
BARIUM 138
Resonance Ionization Mass Spectroscopy
Continuous wave double-resonance ionization and laser-enhanced electron impact ionization, 12:16393 (RA;US)
Yields
Continuous wave double-resonance ionization and laser-enhanced electron impact ionization, 12:16393 (RA;US)
BARIUM CARBONATES
Precipitation
Improved CO_2 enhanced oil recovery mobility control by in-situ chemical precipitation: Annual report for the period September 1985 to September 1986, 12:15355 (R;US)
BARIUM CHLORIDES
Chemical Reactions
Improved CO_2 enhanced oil recovery mobility control by in-situ chemical precipitation: Annual report for the period September 1985 to September 1986, 12:15355 (R;US)
BARIUM FLUORIDES
Spectra
Vibrational characteristics and structure of heavy metal fluoride glasses containing thorium and zirconium, 12:16334 (R;US)
BARRIERS

Gravitation
Comment to the reanalysis of the Eoetvoes experiment, 12:17382 (R;HU)

BATTELLE PACIFIC NORTHWEST LABORATORIES
Research Programs
Alpha-particle dose distribution effects at the cellular level, 12:16871 (RA;US)
Analysis of coal and coal liquid combustion products, 12:15330 (RA;US)
Application of microdosimetry techniques in health physics, 12:17323 (RA;US)
Averaging dose in inhomogeneously irradiated tissue, 12:17332 (RA;US)
Beta measurement evaluation and upgrade, 12:16876 (RA;US)
Beta-particle dosimetry, 12:16863 (RA;US)
Characterization of metabolites and DNA adducts arising from direct coal liquids exposure, 12:15291 (RA;US)
Chemical analysis of coal-derived materials in commercial use, 12:15299 (RA;US)
Chemical characterization of materials from a close-coupled catalytic-catalytic two-stage coal liquefaction process, 12:15293 (RA;US)
Continuous wave double-resonance ionization and laser-enhanced electron impact ionization, 12:16393 (RA;US)
Department of Energy Laboratory Accreditation program for occupational exposure measurements, 12:16877 (RA;US)
Determination of chemical properties and toxicologic activity of hydroaromatic species in coal liquefaction products, 12:15292 (RA;US)
Dose-rate evidence for two kinds of radiation damage in stationary-phase mammalian cells, 12:16866 (RA;US)
Double differential ionization cross sections, 12:17314 (RA;US)
Effect of areal averaging on performance of a long-range acidic deposition, 12:16729 (RA;US)
Effects of phase on differential ionization cross sections, 12:17321 (RA;US)
Effluent monitoring systems at Department of energy facilities, 12:16777 (RA;US)
Environmental protection support and assistance, 12:15443 (RA;US)
Flow-cytometric analysis of plateau-phase mammalian cell populations, 12:16799 (RA;US)
Hazard waste risk assessment, 12:15444 (RA;US)
Health physics support and assistance to the Department of Energy, 12:16873 (RA;US)
Implementation of microdosimetry codes on mini-computers, 12:16872 (RA;US)
Improving the precision and range of cell survival assays, 12:16865 (RA;US)
Ion yields in liquid water, 12:17322 (RA;US)
Kinetic differences between fed and starved Chinese hamster ovary cells, 12:16815 (RA;US)
Laser analysis of directly injected supercritical fluids, 12:16394 (RA;US)
Linear energy transfer (LET) effects on repair rate, 12:16864 (RA;US)
Measurement of energy deposition near heavy ion tracks, 12:17320 (RA;US)
Mechanism of mutagen-induced deoxynucleoside triphosphate imbalance in Chinese hamster ovary (CHO-K1) cells, 12:16869 (RA;US)
Monte Carlo calculation of energy deposition and ionization yield for high energy protons, 12:17324 (RA;US)
Multiple target ionization by proton impact, 12:17319 (RA;US)
Personnel neutron dosimeter evaluation and upgrade program, 12:16875 (RA;US)
Positive ion irradiation facility, 12:16862 (RA;US)
Stochastic repair-misrepair model, 12:16870 (RA;US)
Structured ion impact: double differential cross sections, 12:17316 (RA;US)
Sublethal damage is not the same as potentially lethal damage, 12:16867 (RA;US)
Supercritical fluid chromatography and mass spectrometry, 12:15294 (RA;US)
Survival of subpopulations of plateau-phase Chinese hamster ovary (CHO) cells selected by size, 12:16868 (RA;US)
Technical guidelines for radiological calibrations, 12:16874 (RA;US)
Technical assistance to Department of Energy/Office of Operational Safety Assurance Program for remedial action, 12:15442 (RA;US)
Technology transfer of kinetic phosphorimetry, 12:16392 (RA;US)
Theoretical single differential cross sections for bare ions, 12:17315 (RA;US)
Theoretical cross sections for ionization structured ions, 12:17317 (RA;US)
Total ion and electron yields, 12:17318 (RA;US)

BATTERIES (ELECTRIC)

BCC LATTICES
Diffusion
Atomic-defect mechanisms for diffusion in refractory bcc metals, 12:16248 (R;US)

BEAM OPTICS
T Codes
TOREX program for calculating aberration coefficients of magnetooptical systems, 12:16530 (R;SU;In Russian)

BEAM SEPARATORS
For velocity separation of secondary beams.
Some proposals on mass separation, precision mass spectrometry and acceleration of radioactive nuclides, 12:16561 (R;SU;In Russian)

BEAM TRANSPORT
Electromagnetic Lenses
Application of graphical design method to beam transport system, 12:16521 (R;CN;In Chinese)

BEAM-PLASMA SYSTEMS
Nonlinear Problems
Non-linear stage of beam instability in the absence of electron capture by a wave field, 12:17410 (R;SU;In Russian)

BEARINGS
Failures
Diagnostic monitoring of axial flow fan bearings, 12:15688 (RA;US)

BEAUTY PARTICLES
Particle Production
Bottom quark production at the SSC [Superconducting Super Collider], 12:17124 (R;US)
Weak Particle Decay
Heavy flavour decays and the structure of weak interactions, 12:17132 (R;DE)

BEAVER VALLEY-1 REACTOR
Shippingport, Pennsylvania, USA
Air Samplers
Radioactive and electron microscope analysis of effluent monitor sample lines, 12:15969 (J;US)
Radioactive Effluents
Radioactive and electron microscope analysis of effluent monitor sample lines, 12:15969 (J;US)

BEAVER VALLEY-2 REACTOR
Shippingport, Pennsylvania, USA
Air Samplers
Radioactive and electron microscope analysis of effluent monitor sample lines, 12:15969 (J;US)
Radioactive Effluents
Radioactive and electron microscope analysis of effluent monitor sample lines, 12:15969 (J;US)

BEECH TREES
Photosynthesis
Seasonal patterns of leaf photosynthetic capacity in successional northern hardwood tree species, 12:16805 (J;US)
Pollution
Influence of water running down the stem of trees on the chemical soil characteristics and low vegetation in populations of old beech-trees in different forest stands, 12:16904 (R;DE;In German)

BELGIAN REACTOR 2
See BR-2 REACTOR

BENTONITE
Shrinkage
Shrinkage experiments on bentonite samples, 12:15432 (R;CH;In German)
Stability
Long-term stability of bentonite under repository conditions, 12:15433 (R;CH;In German)
Thermodynamics
Some considerations concerning the thermodynamics and kinetics of the reaction between iron and water in bentonite, 12:16406 (R;CH;In German)
BENZANTHRACENE
Mutagen Screening
Genotoxic effects of binary mixtures of polycyclic aromatic hydrocarbons, 12:16899 (RA;US)
BENZENE
Air Pollution Monitoring
Interlaboratory study of benzene stability of tedlar bags. Final report, 12:16714 (R;US)
Solvent Properties
Phase behavior of coal fluids: Data for correlation development: Report for the period August 1, 1986 to October 31, 1986, 12:15301 (R;US)
BENZOPYRENE
Air Pollution Control
Studies on air pollution by lead, zinc, iron, and 3,4-benzopyrene due to traffic in a small town, 12:16235 (R;DE;In German)
Carcinogen Screening
Action of tumor initiators and promoters in the Syrian hamster embryo cell transformation assay, 12:16902 (RA;US)
Initiation-promotion studies with complex mixtures, 12:15341 (RA;US)
Toxicokinetics of model compounds, 12:16888 (RA;US)
Tumor-promoting activity of complex organic mixtures, 12:15342 (RA;US)
Carcinogenesis
Analysis of DNA adducts using trace organic analytical techniques, 12:16896 (RA;US)
Factors affecting the carcinogenicity of inhaled particle-organic mixtures, 12:16894 (RA;US)
Metabolism of polycyclic aromatic hydrocarbons in coal-derived complex mixtures applied to mouse skin, 12:15335 (RA;US)
Model compounds and complex mixtures in the open-ended rat tracheal implant model: effects and metabolism, 12:16895 (RA;US)
DNA Adducts
Characterization of metabolites and DNA adducts arising from direct coal liquids exposure, 12:15291 (RA;US)
Environmental Impacts
Studies on air pollution by lead, zinc, iron, and 3,4-benzopyrene due to traffic in a small town, 12:16235 (R;DE;In German)
Metabolism
Biological markers of environmental contaminants: analysis of P450 activities and adduct formation in aquatic and terrestrial species exposed to benzo(a)pyrene (Lepomis macrochirus; Ondatra zibethica; Blarina brevicauda), 12:16892 (RA;US)
Metabolism of polycyclic aromatic hydrocarbons in coal-derived complex mixtures applied to mouse skin, 12:15335 (RA;US)
Model compounds and complex mixtures in the open-ended rat tracheal implant model: effects and metabolism, 12:16895 (RA;US)
Mutagen Screening
Genotoxic effects of binary mixtures of polycyclic aromatic hydrocarbons, 12:16899 (RA;US)
Retention
Factors affecting the carcinogenicity of inhaled particle-organic mixtures, 12:16894 (RA;US)
Toxicity
Biological markers of environmental contaminants: analysis of P450 activities and adduct formation in aquatic and terrestrial species exposed to benzo(a)pyrene (Lepomis macrochirus; Ondatra zibethica; Blarina brevicauda), 12:16892 (RA;US)
BENZOPYRROLES
See INDOLES
BERKELEY TRIGA REACTOR
See UCBRR REACTOR
BERYLLIUM
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
BERYLLIUM 12
Hypernuclei
SIGMA hypernuclei: A theoretical review, 12:17299 (R;CA)
BERYLLIUM 9
Nuclear Rsdii
Measurements of interaction cross sections and nuclear radii of Li isotopes, 12:17210 (R;JP)
BERYLLIUM 9 TARGET
Neutron Reactions
On mechanisms of reaction /sup 9/Be(n,2n), 12:17280 (RA;CS)
BERYLLIUM ALLOYS
Magnetic Properties
Normal state magnetic behavior of (U/sub 1-x/RE/sub x/)Be_{13} pseudobinaries, 12:16284 (R;US)
Superconductivity
Normal state magnetic behavior of (U/sub 1-x/RE/sub x/)Be_{13} pseudobinaries, 12:16284 (R;US)
Tensile Properties
Mechanical properties of various alloys in hydrogen. Final report, 12:16289 (R;US)
BERYLLIUM MODERATORS
See BERYLLIUM
BESSEL DIFFERENTIAL EQUATION
See FOKKER-PLANCK EQUATION
BETA BEAMS (ELECTRONS)
See ELECTRON BEAMS
BETA BEAMS (POSITRONS)
See POSITRON BEAMS
BETA DECAY
For neutron and nuclear decay.
Matrix Elements
First forbidden beta decay in light nuclei, 12:17303 (BA;US)
Wave Functions
First forbidden beta decay in light nuclei, 12:17303 (BA;US)
BETA DETECTION
Coincidence Methods
Method of processing data and evaluating uncertainty in $4\pi\beta$-γ coincidence measurement, 12:16597 (R;CN;In Chinese)
BETA DOSIMETRY
Research Programs
Beta measurement evaluation and upgrade, 12:16876 (RA;US)
BETA PARTICLES
Emitted by nuclei.
Occupational Exposure
Department of Energy Laboratory Accreditation program for occupational exposure measurements, 12:16877 (RA;US)
BETA SOURCES
Calibration
Calibration of beta-particle ophthalmic applicators at the National Bureau of Standards, 12:17331 (R;US)
BETA SPECTROMETERS
Efficiency
On relative detection efficiency of a channel electron multiplier for electrostatic beta spectrometer, 12:16636 (R;SU;In Russian)
Liquid Scintillators
Automated beta spectrometer, 12:16628 (R;CS;In Czech)
Microchannel Electron Multipliers
On relative detection efficiency of a channel electron multiplier for electrostatic beta spectrometer, 12:16636 (R;SU;In Russian)
BHABHA ATOMIC RESEARCH CENTER
See BARC

BICRYSTALS
Grain Boundaries
Lattice imaging study of grain boundaries at normal incidence to the boundary plane, 12:16267 (R;US)
BINARY MIXTURES
Viscosity
Viscosity behavior in supercooled pure liquids and mixtures, 12:16407 (R;US)
BINARY STARS
Particle Interactions
High energy neutrino absorption and its effects on stars in close x-ray binaries, 12:17037 (R;US)
Particle Production
High energy neutrino absorption and its effects on stars in close x-ray binaries, 12:17037 (R;US)
X Radiation
Compact galactic X-ray sources, 12:16950 (RA;CS)
BIODEGRADATION
Kinetics
Degradation of ortho phenol by streptomycetes in continuous cultures, 12:16828 (RA;US)
BIOGAS
See METHANE
BIOLOGICAL HALF-LIFE
Mathematical Models
Long-term loss of radium in 63 subjects first exposed at ages 6 to 46, 12:16855 (R;US)
BIOLOGICAL INDICATORS
Land Pollution
Environmental biomonitoring with feral rodent species (Peromyscus leucopus), 12:16900 (RA;US)
BIOLOGICAL MATERIALS
X-Ray Fluorescence Analysis
Trace element measurements using white synchrotron radiation, 12:16534 (R;US)
BIOLOGICAL REACTORS
See BIOREACTORS
BIOLOGICAL REPAIR
Biological Models
Stochastic repair-misrepair model, 12:16870 (RA;US)
BIOMASS
Gasification
Biomass partial gasification. Final report, 12:15584 (R;DE;In German)
International Agreements
Biomass Conversion Task IV 1987 program of work: International Energy Agency Bioenergy Agreement, 12:15610 (R;US)
Production
Biological engineering for sustainable biomass production, 12:15600 (R;US)
Microalgae culture collection, 1986-1987, 12:15613 (R;US)
Research Programs
Biomass Conversion Task IV 1987 program of work: International Energy Agency Bioenergy Agreement, 12:15610 (R;US)
Energy from biomass and wastes: 1985 update, 12:15599 (R;US)
Technology Assessment
Energy from biomass and wastes: 1985 update, 12:15599 (R;US)
BIOMASS PLANTATIONS
Feasibility Studies
Land suitability and availability for energy farming: a regional study Phase 2 report. Final report, 12:15609 (R;US)
BIOREACTORS
Prior to March 1983 this concept was indexed to CHEMICAL REACTORS.
Design
Development of an advanced anaerobic digester design and a kinetic model for biogasification of water hyacinth/sludge blends, 12:15585 (R;US)
Mathematical Models
Development and modelling of a gas/solid fluidized-bed fermenter for ethanol production from S. cerevisiae, 12:15590 (R;DE;In German)
BIOTECHNOLOGY
The application of principles of technology or engineering to the life sciences.
Resource Assessment
Illinois biotechnology resources: An overview, 12:15601 (R;US)
BIPYRIDINES
Oxidation
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
Photochemical Reactions
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
BIRDS
Ecology
Resource utilization by desert quail: time and energy, food and water, 12:16843 (J;US)
Physiology
Resource utilization by desert quail: time and energy, food and water, 12:16843 (J;US)
BISMUTH
Detection
Thin-film chemical sensors based on electron tunneling: Final report, 12:17342 (R;US)
BITTER SPAR
See DOLOMITE
BITUMENS
Refining
Proceedings of the 1986 tar sands symposium, 12:15371 (R;US)
Solvent Extraction
Identification of organic compounds in the bitumen of Chattanooga oil shale, 12:15374 (J;US)
Structural Chemical Analysis
Identification of organic compounds in the bitumen of Chattanooga oil shale, 12:15374 (J;US)
Viscosity
Proceedings of the 1986 tar sands symposium, 12:15371 (R;US)
BITUMINOUS COAL
Calorific Value
Pilot plant evaluation of Illinois No. 6 and Pittsburgh No. 8 coal for the Texaco coal gasification process: Final report, 12:15288 (R;US)
Chemical Composition
Pilot plant evaluation of Illinois No. 6 and Pittsburgh No. 8 coal for the Texaco coal gasification process: Final report, 12:15288 (R;US)
Predicting devolatilization at typical coal combustion conditions with the distributed-energy chain model, 12:15334 (BA;US)
Devolatilization
Predicting devolatilization at typical coal combustion conditions with the distributed-energy chain model, 12:15334 (BA;US)
Hydrogenation
Investigation of coal hydrogenation using deuterium as an isotopic tracer, 12:15308 (BA;US)
Quantitative Chemical Analysis
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
Structural Chemical Analysis
Predicting devolatilization at typical coal combustion conditions with the distributed-energy chain model, 12:15334 (BA;US)
BL LACERTAE OBJECTS
Emission Spectra
Continuum radiation from active galactic nuclei: a statistical study, 12:17039 (R;US)
BLACK HOLES
Capture
On the particle capture cross section in the Schwarzschild metric, 12:17369 (R;SU;In Russian)
Cosmological Models
Two states of CYG X-1 and related sources, 12:17038 (R;US)

Particles
On the particle capture cross section in the Schwarzschild metric, 12:17369 (R;SU;In Russian)
BLADES (COMPRESSOR)
See COMPRESSOR BLADES
BLADES (TURBINES)
See TURBINE BLADES
BLANKETS (BREEDING)
See BREEDING BLANKETS
BLAST FURNACES
Fuel Consumption
Fuel savings by controlling SiO/sub 2/ reduction in blast furnaces. Pt. 1. Laboratory research into the mechanism of SiO/sub 2/ reduction. Final report, 12:16239 (R;DE;In German)
BLOWERS
Bearings
Diagnostic monitoring of axial flow fan bearings, 12:15688 (RA;US)
Cracks
Eddy current on-line monitoring for crack detection, 12:15706 (RA;US)
Mechanical Vibrations
Periodic vibration monitoring at Georgia Power Company, 12:15682 (RA;US)
BLUE-GREEN ALGAE
See CYANOBACTERIA
BNL
Technology Transfer
Brookhaven National Laboratory: Technology transfer report, Fiscal year 1983, 12:16158 (R;US)
BODY CENTERED CUBIC
See BCC LATTICES
BODY WAVES P (SEISMIC)
See SEISMIC P WAVES
BODY WAVES S (SEISMIC)
See SEISMIC S WAVES
BOILERS
Air Pollution Abatement
Demonstration, operation, and testing of a fabric filter on an industrial boiler for an extended period of time. Final report, March 1981-November 1982, 12:16717 (R;US)
Corrosion Protection
Condenser performance improvements, 12:15717 (RA;US)
Factors affecting boiler water chemistry, 12:15712 (RA;US)
Recommended water chemistry practices for high pressure-drum type boilers, 12:15711 (RA;US)
Feedwater
Babcock & Wilcox Company water chemistry guidelines for once-through steam generators and drum boilers, 12:15710 (RA;US)
Factors affecting boiler water chemistry, 12:15712 (RA;US)
Recommended water chemistry practices for high pressure-drum type boilers, 12:15711 (RA;US)
Fouling
Low-rank coal research: Quarterly technical progress report for the period April-June 1986, 12:15310 (R;US)
Hydrogen Embrittlement
Evaluation and use of iron dispersants in the Con Edison System, 12:15723 (RA;US)
Operation
Corrosion product transport in a cycling fossil plant, 12:15735 (RA;US)
BOILING WATER COOLED AND MODERATED REACTO
See BWR TYPE REACTORS
BOLIVIA
Carbon Cycle
Land use change and carbon exchange in the tropics. I. Detailed estimates for Costa Rice, Panama, Peru, and Bolivia, 12:16765 (J;US)
BOLTZMANN COLLISION INTEGRAL
See BOLTZMANN EQUATION
BOLTZMANN EQUATION
Intermolecular Forces
New exact inhomogeneous solutions of the Boltzmann equations, 12:17059 (R;FR)
Numerical Solution
Super problems for supercomputers, 12:17681 (BA;US)
Parallel Processing
Super problems for supercomputers, 12:17681 (BA;US)
BOLTZMANN TRANSPORT EQUATION
See BOLTZMANN EQUATION
BOOSTERS (PARTICLE)
See PARTICLE BOOSTERS
BORN-GREEN-YVON EQUATION
See BOLTZMANN EQUATION
BORON
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Quality of leachate from retorted oil shale wetted with treated process waters, 12:15375 (R;US)
Spectrographic determination of boron in Mo-B microalloys, 12:16380 (R;IN)
BORON 10 TARGET
Neutron Reactions
Calculation of the reaction cross sections of neutrons on /sup 10/B, /sup 11/B by using optical model and Hauser-Feshbach theory, 12:17254 (R;CN;In Chinese)
BORON 11 TARGET
Neutron Reactions
Calculation of the reaction cross sections of neutrons on /sup 10/B, /sup 11/B by using optical model and Hauser-Feshbach theory, 12:17254 (R;CN;In Chinese)
BORON CARBIDES
Physical Radiation Effects
Irradiation damage in boron carbide: point defects, clusters and helium bubbles, 12:16325 (R;FR)
BORON COMPOUNDS
See also BORON CARBIDES
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
BOROSILICATE GLASS
Chemical Reactions
The effects of gamma radiation on groundwater chemistry and glass reaction in a saturated tuff environment, 12:15413 (R;US)
Comparative Evaluations
Evaluation of Synroc-C as a second generation waste form, 12:15446 (R;US)
Leaching
EC static high-temperature leach test. Summary report of an European Community interlaboratory round robin, 12:16358 (R;FR)
Evaluation of Synroc-C as a second generation waste form, 12:15446 (R;US)
Long-term leaching behavior of simulated Savannah River Plant waste glass: Part 1, MCC-1 leachability results, four-year leaching data, 12:16356 (R;US)
Solubility
Solubility tests on borosilicate glasses for West Valley waste immobilization, 12:15473 (J;US)
BOROSILICATES
See BOROSILICATE GLASS
BOTTOM MESONS
See B MESONS
BOTTOM PARTICLES
See BEAUTY PARTICLES
BOUNDARIES (GRAIN)
See GRAIN BOUNDARIES
BOVINE
See CATTLE
BR-2 REACTOR
Fuel Elements
Preliminary LEU fuel cycle analyses for the Belgian BR2 reactor, 12:15981 (R;US)

BRACKISH WATER ECOSYSTEMS
See AQUATIC ECOSYSTEMS
BRAIN
See also HIPPOCAMPUS
Positron Computed Tomography
Improved delineation of human dopamine receptors using [18F]-N-methylspiroperidol and PET, 12:16816 (J;US)
BRASS-BETA
Embrittlement
Stress corrosion cracking and metal-induced embrittlement: Comparative studies of local chemistries: Progress report for period September 1, 1986-January 15, 1987, 12:16268 (R;US)
Stress Corrosion
Stress corrosion cracking and metal-induced embrittlement: Comparative studies of local chemistries: Progress report for period September 1, 1986-January 15, 1987, 12:16268 (R;US)
BRAZIL
Deforestation
Changes in the area of forests in Rondonia, Amazon Basin, measured by satellite imagery, 12:16780 (BA;US)
BREAKUP REACTIONS
Three-Body Problem
Consideration of the (n,d) and (p,d) scattering and breakup reactions through singular integral equations, 12:17279 (RA;CS)
BREASTS
See MAMMARY GLANDS
BREEDER REACTORS
See also FBR TYPE REACTORS
LWBR TYPE REACTORS
Reactor Components
Complete sodium removal from equipment, 12:15860 (J;US)
BREEDING BLANKETS
Composite Materials
Composite beryllium-ceramics breeder pin elements for a gas cooled solid blanket, 12:17426 (R;FR)
Computerized Simulation
The neutronic analysis for the LBM/LOTUS experiment, 12:17525 (J;US)
Construction
Overview of the TFTR Lithium Blanket Module program, 12:17523 (J;US)
Coolants
Entry length effects in liquid metal fusion blankets, 12:17521 (J;US)
Experimental and analytical investigations of magnetohydrodynamic flows near the entrance to a strong magnetic field, 12:17522 (J;US)
Lithium-cooled blankets for advanced tokamaks, 12:17520 (J;US)
Cooling
Applications of the Aqueous Self-Cooled Blanket concept, 12:17516 (J;US)
Conceptual design of a self-cooled FLIBE blanket, 12:17514 (J;US)
Coordinated Research Programs
Analyses and intercomparison for Phase I Fusion Integral Experiments at the FNS Facility, 12:17509 (J;US)
Summary of recent results from the JAERI/U.S. Fusion Neutronics Phase I Experiments, 12:17508 (J;US)
Cost Estimation
Cost study of the ESPRESSO blanket for a tandem mirror reactor, 12:17599 (J;US)
Deformation
The bowing of solid breeder rods in a pin-type fusion reactor, 12:17602 (J;US)
Design
A model for the mechanical interaction between solid breeder and cladding materials, 12:17601 (J;US)
A thin LiPb/Be helium cooled blanket for MINIMARS: Neutronics analysis, 12:17596 (J;US)
Applications of the Aqueous Self-Cooled Blanket concept, 12:17516 (J;US)
Conceptual design of a self-cooled FLIBE blanket, 12:17514 (J;US)
First wall structural analysis of the aqueous self-cooled blanket concept, 12:17600 (J;US)
Liquid momentum removal using rod arrays applied to the HYLIFE ICF reactor, 12:17568 (J;US)
Lithium-cooled blankets for advanced tokamaks, 12:17520 (J;US)
Neutronics analysis for aqueous self-cooled fusion reactor blankets, 12:17594 (J;US)
Overview of the TFTR Lithium Blanket Module program, 12:17523 (J;US)
Required momentum, heat, and mass transport experiments for liquid metal blankets, 12:17530 (J;US)
Status of fusion reactor blanket design, 12:17510 (J;US)
The bowing of solid breeder rods in a pin-type fusion reactor, 12:17602 (J;US)
Thermal-hydraulic study of the ESPRESSO blanket for a Tandem Mirror Reactor, 12:17605 (J;US)
Thin blanket design for MINIMARS - A compact tandem mirror fusion reactor, 12:17511 (J;US)
Thin blanket designs for the Elongated Tokamak Commercial Reactor, 12:17515 (J;US)
Uncertainties in liquid metal fusion blanket design windows, 12:17519 (J;US)
Eddy Currents
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)
Flow Models
Experimental and analytical investigations of magnetohydrodynamic flows near the entrance to a strong magnetic field, 12:17522 (J;US)
Flowmeters
Techniques for measurement of velocity in liquid-metal MHD flows, 12:17518 (J;US)
Heat Transfer
Entry length effects in liquid metal fusion blankets, 12:17521 (J;US)
Required momentum, heat, and mass transport experiments for liquid metal blankets, 12:17530 (J;US)
Uncertainties in liquid metal fusion blanket design windows, 12:17519 (J;US)
Hydraulics
Steady-state and transient thermal hydraulics of a breeder-in-tube blanket design, 12:17603 (J;US)
Thermal-hydraulic study of the ESPRESSO blanket for a Tandem Mirror Reactor, 12:17605 (J;US)
Irradiation
Tritium assay of Li/sub 2/O in the LBM/LOTUS experiments, 12:17527 (J;US)
Liquid Metals
Liquid momentum removal using rod arrays applied to the HYLIFE ICF reactor, 12:17568 (J;US)
Magnetohydrodynamics
Entry length effects in liquid metal fusion blankets, 12:17521 (J;US)
Experimental and analytical investigations of magnetohydrodynamic flows near the entrance to a strong magnetic field, 12:17522 (J;US)
Lithium-cooled blankets for advanced tokamaks, 12:17520 (J;US)
Uncertainties in liquid metal fusion blanket design windows, 12:17519 (J;US)
Mass Transfer
Required momentum, heat, and mass transport experiments for liquid metal blankets, 12:17530 (J;US)
Materials
Conceptual design of a self-cooled FLIBE blanket, 12:17514 (J;US)
Helium-cooled, FLiBe-breeder, beryllium-multiplier blanket for MINIMARS, 12:17513 (J;US)
Neutronic optimization of a LiAlO/sub 2/ solid breeder blanket, 12:17604 (J;US)
Materials Testing
First wall structural analysis of the aqueous self-cooled blanket concept, 12:17600 (J;US)
Structural materials for fusion reactor blanket systems, 12:17627 (BA;US)
The chemistry of molten Li/sub 2/BeF/sub 4/, 12:17581 (J;US)

Thermodynamic performance of ceramic tritium breeding blanket material, 12:17580 (J;US)
Thin blanket designs for the Elongated Tokamak Commercial Reactor, 12:17515 (J;US)
Mathematical Models
A model for the mechanical interaction between solid breeder and cladding materials, 12:17601 (J;US)
MHD Generators
In-situ MHD energy conversion for fusion, 12:17554 (J;US)
Molten Salts
Nuclear performance optimization of the molten-salt fusion breeder, 12:17534 (J;US)
Neutron Dosimetry
Lithium Blanket Module (LBM) dosimetry measurements at the LOTUS 14-MeV neutron source facility, 12:17526 (J;US)
Neutron Reactions
A comparative study of tritium breeding calculations using JEF-1 and ENDF/B-V based nuclear data libraries, 12:17540 (J;US)
Neutron Spectra
Analyses and intercomparison for Phase I Fusion Integral Experiments at the FNS Facility, 12:17509 (J;US)
Neutronic optimization of a LiAlO/sub 2/ solid breeder blanket, 12:17604 (J;US)
Neutronics analysis for aqueous self-cooled fusion reactor blankets, 12:17594 (J;US)
Summary of recent results from the JAERI/U.S. Fusion Neutronics Phase I Experiments, 12:17508 (J;US)
The neutronic analysis for the LBM/LOTUS experiment, 12:17525 (J;US)
Neutron Transport
The LBM program at the EPFL/LOTUS Facility, 12:17524 (J;US)
Performance
An inherently safe tandem mirror fusion blanket concept, 12:17512 (J;US)
Geometrical, spectral and temporal differences between ICF and MCF reactors and their impact on blanket nuclear parameters, 12:17597 (J;US)
Neutronics analysis for aqueous self-cooled fusion reactor blankets, 12:17594 (J;US)
Nuclear performance optimization of the molten-salt fusion breeder, 12:17534 (J;US)
SIEX3: A correlated computer code for prediction of fast reactor mixed oxide fuel and blanket pin performance, 12:15854 (R;US)
Performance Testing
A thin LiPb/Be helium cooled blanket for MINIMARS: Neutronics analysis, 12:17596 (J;US)
Fission reactor experiments for solid breeder blankets, 12:17531 (J;US)
Overview of the TFTR Lithium Blanket Module program, 12:17523 (J;US)
Technical requirements of experiments and facilities for fusion nuclear technology, 12:17529 (J;US)
Trade-off study of liquid metal self-cooled blankets, 12:17595 (J;US)
Physical Radiation Effects
Study of a breeding material - γ lithium aluminate, 12:17428 (R;FR)
Pressure Drop
Uncertainties in liquid metal fusion blanket design windows, 12:17519 (J;US)
Research Programs
Lithium Blanket Module (LBM) dosimetry measurements at the LOTUS 14-MeV neutron source facility, 12:17526 (J;US)
Technical requirements of experiments and facilities for fusion nuclear technology, 12:17529 (J;US)
The LBM program at the EPFL/LOTUS Facility, 12:17524 (J;US)
The neutronic analysis for the LBM/LOTUS experiment, 12:17525 (J;US)
Tritium assay of Li/sub 2/O in the LBM/LOTUS experiments, 12:17527 (J;US)
Rods
The bowing of solid breeder rods in a pin-type fusion reactor, 12:17602 (J;US)
S Codes
SIEX3: A correlated computer code for prediction of fast reactor mixed oxide fuel and blanket pin performance, 12:15854 (R;US)
Safety Engineering
Fusion blanket inherent safety assessment, 12:17547 (J;US)
Swelling
A model for the mechanical interaction between solid breeder and cladding materials, 12:17601 (J;US)
The bowing of solid breeder rods in a pin-type fusion reactor, 12:17602 (J;US)
Temperature Gradients
Entry length effects in liquid metal fusion blankets, 12:17521 (J;US)
Thermodynamics
Steady-state and transient thermal hydraulics of a breeder-in-tube blanket design, 12:17603 (J;US)
Thermal-hydraulic study of the ESPRESSO blanket for a Tandem Mirror Reactor, 12:17605 (J;US)
Thermodynamic performance of ceramic tritium breeding blanket material, 12:17580 (J;US)
Thickness
A thin LiPb/Be helium cooled blanket for MINIMARS: Neutronics analysis, 12:17596 (J;US)
Torque
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)
BREMSSTRAHLUNG (MAGNETIC)

ATWS
Analysis of MSIV-ATWS events with the BNL plant analyzer, 12:16091 (J;US)
Correlation for predicting reactor power during a BWR ATWS, 12:16133 (J;US)
Auxiliary Water Systems
Decontamination by water jet, chemical and electrochemical methods, 12:15772 (R;FR;In French)
Capitalized Cost
Concept of prudence and its impact, 12:16180 (J;US)
Construction
Concept of prudence and its impact, 12:16180 (J;US)
Control Rod Drives
BWR control rod drive scram pilot valve monitoring program, 12:15767 (RA;US)
ECCS
Passive steam-driven injector as ECCS for an inherently safe BWR, 12:16078 (J;US)
Electrical Equipment
Identification of test candidates for investigating the survivability of electrical equipment during severe accidents, 12:16120 (J;US)
Failed Element Detection
LWR Fuel failure detection using the grip sipping method, 12:15779 (J;US)
Fuel Cans
PWR [pressurized water reactor] fuel element behavior at temperatures up to 2350°C, 12:16023 (R;DE)
Fuel Elements
Fuel performance and fission product release during loss of coolant and severe fuel damage accidents, 12:16022 (R;CA)
Steady-sate and load-follow characteristics of various BWR fuel designs, 12:15783 (J;US)
The relationships and influences of fuel and coolant system processes during LWR severe accidents, 12:16061 (R;US)
Fuel Management
Application of high-burnup experience to consolidation equipment design, 12:15782 (J;US)
Low incremental control worth reload patterns for BWRs, 12:15761 (R;IN)
Fuel Rods
ARMP-02 documentation: Part 2, Chapter 7, MICBURN-E computer code manual: Volume 1, Theory and numerics manual, 12:15774 (R;US)
Development of a PCMI analysis code for the Fugen MOX fuel rod, 12:15845 (BA;US)
Research of LWR [light water reactor] fuel rod behaviour under accident conditions, 12:16033 (R;XA)
Fuel-Cladding Interactions
PWR [pressurized water reactor] fuel element behavior at temperatures up to 2350°C, 12:16023 (R;DE)
Heat Transfer
Abnormal transients in nuclear power plants, Atlanta, Georgia, April 12-15, 1987, 12:15792 (J;US)
Algorithms for the solution of the mixture drift-flux equations on multi-CPU vector pipeline machines, 12:15789 (J;US)
Improved numerical method for subchannel cross-flow calculations, 12:15784 (J;US)
Thermal-hydraulic issues in nuclear training, 12:15791 (J;US)
Hydraulics
Abnormal transients in nuclear power plants, Atlanta, Georgia, April 12-15, 1987, 12:15792 (J;US)
Algorithms for the solution of the mixture drift-flux equations on multi-CPU vector pipeline machines, 12:15789 (J;US)
Improved numerical method for subchannel cross-flow calculations, 12:15784 (J;US)
Thermal-hydraulic issues in nuclear training, 12:15791 (J;US)
Loss of Coolant
Assessment of the heat transfer models in the TRACB02 code, 12:16138 (J;US)
BWR/6 DBA analysis with limited ECC, 12:16090 (J;US)
Effect of bubbly/slug interfacial shear on liquid carryover predicted by RELAP5/MOD2 during reflooding, 12:16135 (J;US)
Fuel performance and fission product release during loss of coolant and severe fuel damage accidents, 12:16022 (R;CA)
Modifications and assessment of rewetting correlations for light water reactor system analysis, 12:16134 (J;US)

Simulation experiments for hot-leg U-bend two-phase flow phenomena, 12:16018 (R;US)
Materials Handling Equipment
Application of high-burnup experience to consolidation equipment design, 12:15782 (J;US)
Mathematical Models
A reduced-order model of boiling water reactor linear dynamics, 12:15776 (J;US)
Nuclear Fuels
PWR [pressurized water reactor] fuel element behavior at temperatures up to 2350°C, 12:16023 (R;DE)
Pipes
Application of the leak-before-break approach to BWR piping: Final report, 12:16029 (R;US)
BWR pipe crack remedies evaluation, 12:15764 (R;US)
Pressure Suppression
TRACB04 study on suppression pool swelling during containment venting, 12:16092 (J;US)
Pressure Vessels
Flaw density examinations of a clad boiling water reactor pressure vessel segment, 12:15763 (R;US)
Primary Coolant Circuits
Acoustic emission/flaw relationship for in-service monitoring of nuclear pressure vessels: Progress report, April 1986-September 1986, 12:15773 (R;US)
Radioactive Waste Management
Operating a transportable volume reduction and solidification system (TVR-III), 12:15468 (J;US)
Reactor Accidents
Effect of hygroscopicity on aerosol behavior, 12:16103 (J;US)
Effects of organic impurities on the partitioning of iodine, 12:16105 (J;US)
Experimental determination of the partition coefficient of HOI, 12:16104 (J;US)
Identification of test candidates for investigating the survivability of electrical equipment during severe accidents, 12:16120 (J;US)
QUASAR: a methodology for quantification of uncertainties in severe-accident source terms, 12:16102 (J;US)
Quasar uncertainty study, 12:16004 (R;US)
Research of LWR [light water reactor] fuel rod behaviour under accident conditions, 12:16033 (R;XA)
The relationships and influences of fuel and coolant system processes during LWR severe accidents, 12:16061 (R;US)
Reactor Channels
Streamlined one-pass modelling, 12:15835 (J;US)
Reactor Components
Characterization of the performance of major LWR components: Final report, 12:15770 (R;US)
Synthesizing seismic fragility of components by use of existing data, 12:16006 (R;US)
Reactor Cooling Systems
Properties of colloidal corrosion products and their effects on nuclear plants: Final report, 12:15769 (R;US)
Technical basis for normal water chemistry guidelines: Review of laboratory studies of water chemistry effects on SCC [stress corrosion cracking], 12:15766 (R;US)
The relationships and influences of fuel and coolant system processes during LWR severe accidents, 12:16061 (R;US)
Reactor Core Disruption
Application of a direct-heating model to the Sandia SURTSEY tests, 12:16140 (J;US)
Corium droplet size in direct containment heating, 12:16139 (J;US)
Effects of water in film boiling over liquid-metal melts, 12:16107 (J;US)
Fuel performance and fission product release during loss of coolant and severe fuel damage accidents, 12:16022 (R;CA)
Heat radiation through steam in direct containment heating, 12:16142 (J;US)
Reactor Cores
ARMP-02 documentation: Part 2, Chapter 12, NORGE-B2 computer code manual: Volume 2, User's manual, 12:15777 (R;US)
ARMP-02 documentation: Part 2, Chapter 7, MICBURN-E computer code manual: Volume 1, Theory and numerics manual, 12:15774 (R;US)
ARMP-02 documentation: Part 2, Chapter 12, NORGE-B2 computer code manual: Volume 3, Programmer's manual, 12:15775 (R;US)
Countercurrent flow and flooding with abrupt area changes, 12:15793 (J;US)
Dual loop jet pump model for BWR stability analysis, 12:15795 (J;US)
Prediction of transient axial power distribution for calculation of the DNBR limit, 12:15794 (J;US)
Startup range neutron monitor period-based transient monitor, 12:15788 (J;US)
The relationships and influences of fuel and coolant system processes during LWR severe accidents, 12:16061 (R;US)
Reactor Fueling
Low incremental control worth reload patterns for BWRs, 12:15761 (R;IN)
Reactor Kinetics
Improved numerical method for subchannel cross-flow calculations, 12:15784 (J;US)
Reactor Materials
Aging degradation of cast stainless steel, 12:15765 (R;US)
BWR pipe crack remedies evaluation, 12:15764 (R;US)
Compilation of corrosion data on the CAN-DECON process: Volume 5, Influence of the CAN-DECON process on stress corrosion cracking: Summary of testing, 1984-1985: Final report, 12:15768 (R;US)
Compilation of corrosion data on the CAN-DECON process: Volume 3, Influence of the CAN-DECON process on stress corrosion cracking: 1984 constant-extension-rate tests: Final report, 12:15948 (R;US)
Technical basis for normal water chemistry guidelines: Review of laboratory studies of water chemistry effects on SCC [stress corrosion cracking], 12:15766 (R;US)
Reactor Operation
Long-range goal setting in the nuclear utility industry, 12:15787 (J;US)
Reactor Physics
ARMP-02 documentation: Part 2, Chapter 12, NORGE-B2 computer code manual: Volume 2, User's manual, 12:15777 (R;US)

ARMP-02 documentation: Part 2, Chapter 12, NORGE-B2 computer code manual: Volume 3, Programmer's manual, 12:15775 (R;US)
Reactor Safety
Analysis of MSIV-ATWS events with the BNL plant analyzer, 12:16091 (J;US)
Analysis of reactor trips involving balance-of-plant failures, 12:16100 (J;US)
Application of a direct-heating model to the Sandia SURTSEY tests, 12:16140 (J;US)
Assessment of the heat transfer models in the TRACB02 code, 12:16138 (J;US)
BWR/6 DBA analysis with limited ECC, 12:16090 (J;US)
Corium droplet size in direct containment heating, 12:16139 (J;US)
Correlation for predicting reactor power during a BWR ATWS, 12:16133 (J;US)
Effect of bubbly/slug interfacial shear on liquid carryover predicted by RELAP5/MOD2 during reflooding, 12:16135 (J;US)
Effects of water in film boiling over liquid-metal melts, 12:16107 (J;US)
Gravity-driven core cooling system for a BWR, 12:16077 (J;US)
Heat radiation through steam in direct containment heating, 12:16142 (J;US)
TRACB04 study on suppression pool swelling during containment venting, 12:16092 (J;US)
Reactor Shutdown
Analysis of reactor trips involving balance-of-plant failures, 12:16100 (J;US)
Summary of safety relief valve position indication systems, 12:16119 (J;US)

Reactor Simulators
LWR system simulation and transient analysis package on the Oregon State cyber-VE, 12:15790 (J;US)
Reactor Stability
Dual loop jet pump model for BWR stability analysis, 12:15795 (J;US)
Reactor Start-Up
Startup range neutron monitor period-based transient monitor, 12:15788 (J;US)
Relief Valves
Summary of safety relief valve position indication systems, 12:16119 (J;US)
Soil-Structure Interactions
SSI [soil-structure interactions] and structural benchmarks, 12:16005 (R;US)
Spent Fuel Elements
Finite difference solution procedure for convection-diffusion problems in irregular geometries, 12:16480 (J;US)
Preliminary characterization of radioactive crud for design of dry spent-fuel handling facilities, 12:15402 (J;US)
Spent Fuel Storage
Optimization of spent-fuel storage equipment with extended burnup, 12:15781 (J;US)
Steam Generators
Calculation of once-through steam generator performance using RELAP5/MOD2, 12:15833 (J;US)
Systems Analysis
Analysis of reactor trips involving balance-of-plant failures, 12:16100 (J;US)
Transfer Functions
A reduced-order model of boiling water reactor linear dynamics, 12:15776 (J;US)
Turbines
Equipment and procedural modifications to improve the reliability of Terry turbines used in nuclear service, 12:15785 (J;US)

Organic storage of CO_2 on the continental slope off the mid-Atlantic bight, the southeastern Bering Sea, and the Peru coast, 12:16786 (J;GB)
Reflectivity
Performance of multilayer dispersion elements from 80 to 500 eV, 12:16324 (BA;US)
Solidification
Analysis of picosecond pulsed laser melted graphite, 12:17352 (R;US)
CARBON 12
Hypernuclei
SIGMA hypernuclei: A theoretical review, 12:17299 (R;CA)
Isotope Ratio
Core processing and first analysis of ice cores from Siple and South Pole stations, 12:16767 (J;US)
CARBON 12 REACTIONS
Gamma Radiation
γ-production in peripheral interactions of relativistic carbon nuclei in propane and the anomalon problem, 12:17211 (R;SU)
Incomplete Fusion Reactions
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)
Inelastic Scattering
Giant resonance excitation by inelastic scattering of medium energy ^{12}C ions, 12:17233 (R;FR)
Nuclear Fireball Model
Excitation of target residues in the firestreak model, 12:17289 (R;SU)
Nuclear Reaction Yield
Excitation of target residues in the firestreak model, 12:17289 (R;SU)
CARBON 12 TARGET
Alpha Reactions
Pion multiplicity in α-nucleus reactions from 200 to 800 A. MeV, 12:17205 (R;FR)
Carbon 12 Reactions
γ-production in peripheral interactions of relativistic carbon nuclei in propane and the anomalon problem, 12:17211 (R;SU)
Kaon Minus Reactions
SIGMA hypernuclei: A theoretical review, 12:17299 (R;CA)
Oxygen 16 Reactions
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)
Pion Minus Reactions
Four-dimentional hadron jets-universal characteristics of particle multiple production, 12:17201 (R;SU;In Russian)
Pion Plus Reactions
Observation of energetic protons in coincidence with pion-induced double charge exchange on /sup 12/C and /sup 48/Ca, 12:17212 (J;NL)
Proton Reactions
Four-dimentional hadron jets-universal characteristics of particle multiple production, 12:17201 (R;SU;In Russian)
Noneikonal effects in cross sections of proton reactions on nuclei, 12:17282 (RA;SU;In Russian)
CARBON 13
Diagnostic Uses
In vivo monitoring of line 168 mammary tumors by topical nuclear magnetic resonance, 12:16823 (J;US)
Isotope Ratio
Core processing and first analysis of ice cores from Siple and South Pole stations, 12:16767 (J;US)
CARBON BLACK
Heating
Pt-Ti alloy formation from high-temperature reduction of a titania-impregnated Pt catalyst: implications for strong metal-support interaction, 12:16300 (J;US)
CARBON COMPOUNDS
See also CARBONIC ACID
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
CARBON CYCLE
Global Aspects
Calibrating ocean models by the constrained inverse method, 12:16784 (BA;US)
Carbon isotope measurements in baseline air, forest canopy air, and plants, 12:16749 (BA;US)
Changes in soil carbon storage and associated properties with disturbance and recovery, 12:16778 (BA;US)
Changing carbon cycle: a global analysis, 12:16737 (B;US)
Changing carbon cycle: a global analysis, 12:16741 (B;US)
Fossil fuel combustion: recent amounts, patterns, and trends in CO_2, 12:16757 (BA;US)
Global atmospheric CO_2 distribution 1968-1983: interpretation of the results of the NOAA/GMCC measurement program, 12:16742 (BA;US)
Major world ecosystem complexes ranked by carbon in live vegetation: a database, 12:16710 (R;US)
Review of the history of atmospheric CO_2 recorded in ice cores, 12:16746 (BA;US)
Mathematical Models
Analysis of the seasonal and geographical patterns of atmospheric CO_2 distributions with a three-dimensional tracer model, 12:16756 (BA;US)
Calibrating ocean models by the constrained inverse method, 12:16784 (BA;US)
One-dimensional and two-dimensional ocean models for predicting the distribution of CO_2 between the ocean and the atmosphere, 12:16751 (BA;US)

Requirements for a satisfactory model of the global carbon cycle and current status of modeling efforts, 12:16754 (BA;US)
Three-dimensional ocean models for predicting the distribution of CO_2 between the ocean and atmosphere, 12:16752 (BA;US)
Use of observations in calibrating and validating carbon cycle models, 12:16755 (BA;US)
Research Programs
Carbon isotope measurements in baseline air, forest canopy air, and plants, 12:16749 (BA;US)
Variations
Ancient carbon cycle changes derived from tree-ring ^{13}C and ^{14}C, 12:16747 (BA;US)
Estimating changes in the carbon content of terrestrial ecosystems, 12:16750 (BA;US)
CARBON DIOXIDE
Adsorption
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
Air Pollution Control
A study on the systematic control of CO/sub 2/ emissions from fossil-fuel power plants in the U.S., 12:16730 (J;US)
Air Pollution Monitoring
Analysis of the seasonal and geographical patterns of atmospheric CO_2 distributions with a three-dimensional tracer model, 12:16756 (BA;US)
Atmospheric CO_2 concentrations Mauna Loa Observatory, Hawaii 1958-1983, 12:16708 (R;US)
Atmospheric CO_2 record from direct chemical measurements during the 19th century, 12:16745 (BA;US)
Air-Water Interactions
Transient Tracers in the Oceans (TTO) hydrographic data and carbon dioxide systems, 12:16709 (R;US)
Atmospheric Chemistry
Atmospheric CO/sub 2/ variations based on the tree-ring 13/sub C/ record, 12:16766 (BA;US)
Biological Effects
Effect of carbon dioxide on sorghum yield, root growth, and water use, 12:16906 (J;NL)
Effects of atmospheric CO_2 enrichment on the growth and mineral nutrition of Quercus alba seedlings in nutrient-poor soil, 12:16908 (J;US)
Effects of elevated CO_2 on plants. III. Flower, fruit and seed production and abortion (Datura stramonium; Abutilon theophrasti; Phlox drummondii), 12:16910 (J;GB)
Predicting the response of plants to increasing carbon dioxide: a critique of plant growth models, 12:16764 (J;NL)
Chemical Reactions
Improved CO_2 enhanced oil recovery mobility control by in-situ chemical precipitation: Annual report for the period September 1985 to September 1986, 12:15355 (R;US)
Climate Models
Simulating the atmospheric carbon dioxide distribution with a three-dimensional tracer model, 12:16743 (BA;US)
Crystallization
CNG acid gas removal process: Technical progress report No. 5, 1 October-31 December 1984, 12:15277 (R;US)
Ecological Concentration
Analysis of the seasonal and geographical patterns of atmospheric CO_2 distributions with a three-dimensional tracer model, 12:16756 (BA;US)
Analytical solution for the effect of increasing CO_2 on global mean temperature, 12:16761 (J;GB)
Ancient carbon cycle changes derived from tree-ring ^{13}C and ^{14}C, 12:16747 (BA;US)
Atmospheric CO_2 concentrations Mauna Loa Observatory, Hawaii 1958-1983, 12:16708 (R;US)
Atmospheric CO_2 record from direct chemical measurements during the 19th century, 12:16745 (BA;US)
Atmospheric CO/sub 2/ variations based on the tree-ring 13/sub C/ record, 12:16766 (BA;US)
Calibrating ocean models by the constrained inverse method, 12:16784 (BA;US)
Carbon dioxide increase in the atmosphere and oceans and possible effects on climate, 12:16739 (J;US)
Carbon isotope measurements in baseline air, forest canopy air, and plants, 12:16749 (BA;US)
Carbonate chemistry during WEPOLEX-81, 12:16790 (J;US)
Changing carbon cycle: a global analysis, 12:16737 (B;US)
Changing carbon cycle: a global analysis, 12:16741 (B;US)
Core processing and first analysis of ice cores from Siple and South Pole stations, 12:16767 (J;US)
Detection of changes in the global troposphere temperature field induced by greenhouse gases, 12:16734 (J;US)
Effect of carbon dioxide on sorghum yield, root growth, and water use, 12:16906 (J;NL)
Estimating changes in the carbon content of terrestrial ecosystems, 12:16750 (BA;US)
Excess carbon dioxide in the Weddell Sea, 12:16788 (J;US)
Fossil fuel combustion: recent amounts, patterns, and trends in CO_2, 12:16757 (BA;US)
General circulation model CO_2 sensitivity experiments: snow-sea ice albedo parameterizations and globally averaged surface air temperature, 12:16738 (J;NL)
Geologic analogs: their value and limitations in carbon dioxide research, 12:16753 (BA;US)
Global atmospheric CO_2 distribution 1968-1983: interpretation of the results of the NOAA/GMCC measurement program, 12:16742 (BA;US)
Global atmospheric CO_2 distribution and variations from 1968-1982 NOAA/GMCC CO_2 flask sample data, 12:16762 (J;US)
IEA/ORAU long-term global energy-CO_2 model, 12:16700 (R;US)
Inhomogeneous distribution of tracers in the abyssal southern ocean, 12:16792 (J;US)
Interpretation of the Northern Hemispheric record of $^{13}C/^{12}C$ trends of atmospheric CO_2 in tree rings, 12:16748 (BA;US)
Measurements of total carbon dioxide and alkalinity in the North Atlantic Ocean in 1981, 12:16785 (BA;US)
Modeling needs for predicting responses to CO_2 enrichment: plants, communities and ecosystems, 12:16763 (J;NL)
One-dimensional and two-dimensional ocean models for predicting the distribution of CO_2 between the ocean and the atmosphere, 12:16751 (BA;US)
Possible changes in future use of fossil fuels to limit environmental effects, 12:16758 (BA;US)
Predicting the response of plants to increasing carbon dioxide: a critique of plant growth models, 12:16764 (J;NL)
Preliminary observations of oxygen and carbon dioxide of the wintertime Bering Sea marginal ice zone, 12:16787 (J;GB)
Presentation of the 20th century atmospheric CO_2 record in Smithsonian spectrographic plates, 12:16744 (BA;US)
Relationship between atmospheric CO_2 variations and a satellite-derived vegetation index, 12:16736 (J;GB)
Requirements for a satisfactory model of the global carbon cycle and current status of modeling efforts, 12:16754 (BA;US)
Review of the history of atmospheric CO_2 recorded in ice cores, 12:16746 (BA;US)
Simulating the atmospheric carbon dioxide distribution with a three-dimensional tracer model, 12:16743 (BA;US)
Temperatures rise in the global greenhouse, 12:16735 (J;GB)
Three-dimensional ocean models for predicting the distribution of CO_2 between the ocean and atmosphere, 12:16752 (BA;US)
Transient Tracers in the Oceans (TTO) hydrographic data and carbon dioxide systems, 12:16709 (R;US)
Emission
Global energy and carbon dioxide, 12:16701 (R;US)
Environmental Effects
Analytical solution for the effect of increasing CO_2 on global mean temperature, 12:16761 (J;GB)
Carbon dioxide increase in the atmosphere and oceans and possible effects on climate, 12:16739 (J;US)
Effects of dynamic heat fluxes on model climate sensitivity: meridional sensible and latent heat fluxes, 12:16759 (J;US)
Radiodensitometric tree-ring analysis along altitudinal gradients: Some alternative procedures for detecting site, climatic, and potential CO_2 effects on tree growth, 12:16773 (R;US)

Relationship between atmospheric CO_2 variations and a satellite-derived vegetation index, 12:16736 (J;GB)
Temperatures rise in the global greenhouse, 12:16735 (J;GB)
General Circulation Models
General circulation model CO_2 sensitivity experiments: snow-sea ice albedo parameterizations and globally averaged surface air temperature, 12:16738 (J;NL)
Mass Transfer
Gas exchange measurements in natural systems, 12:16789 (BA;US)
Mathematical Models
IEA/ORAU long-term global energy-CO_2 model, 12:16700 (R;US)
Monitoring
Global atmospheric CO_2 distribution and variations from 1968-1982 NOAA/GMCC CO_2 flask sample data, 12:16762 (J;US)
Measurements of total carbon dioxide and alkalinity in the North Atlantic Ocean in 1981, 12:16785 (BA;US)
Pollution Sources
Fossil fuel combustion: recent amounts, patterns, and trends in CO_2, 12:16757 (BA;US)
Geologic analogs: their value and limitations in carbon dioxide research, 12:16753 (BA;US)
Interpretation of the Northern Hemispheric record of $^{13}C/^{12}C$ trends of atmospheric CO_2 in tree rings, 12:16748 (BA;US)
Possible changes in future use of fossil fuels to limit environmental effects, 12:16758 (BA;US)
Reduction
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)
Research Programs
Global atmospheric CO_2 distribution 1968-1983: interpretation of the results of the NOAA/GMCC measurement program, 12:16742 (BA;US)
Sinks
Organic storage of CO_2 on the continental slope off the mid-Atlantic bight, the southeastern Bering Sea, and the Peru coast, 12:16786 (J;GB)
Solubility
Phase behavior of coal fluids: Data for correlation development: Report for the period August 1, 1986 to October 31, 1986, 12:15301 (R;US)
Spectroscopy
HALOE science investigation. Semiannual progress report, February-July 1986, 12:16705 (R;US)
Uptake
Carbon dioxide exchange and growth of a pine plantation, 12:16809 (J;NL)

CARBON DIOXIDE FIXATION
Mathematical Models
Model of carbon dioxide assimilation in Chlamydomonas reinhardii, 12:16810 (J;DE)

CARBON DIOXIDE INJECTION
Bench-Scale Experiments
Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 45, Quarter ending December 31, 1985, 12:15353 (R;US)
Improved CO_2 enhanced oil recovery mobility control by in-situ chemical precipitation: Annual report for the period September 1985 to September 1986, 12:15355 (R;US)
Field Tests
Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 45, Quarter ending December 31, 1985, 12:15353 (R;US)

CARBON DIOXIDE LASERS
Plasma Production
Plasma plume effects in pulsed carbon dioxide laser spot welding, 12:16321 (BA;US)

CARBON FIBERS
Bromination
Effects of graphitization on the environmental stability of brominated pitch-based fibers, 12:16362 (R;US)
Electric Conductivity
Effects of graphitization on the environmental stability of brominated pitch-based fibers, 12:16362 (R;US)
Thermal Conductivity
Thermal conductivity of pristine and brominated P-100 fibers, 12:16360 (R;US)

CARBON ISOTOPES
See also CARBON 12
CARBON 13
Radioecological Concentration
Inhomogeneous distribution of tracers in the abyssal southern ocean, 12:16792 (J;US)

CARBON MONOXIDE
Chemisorption
Modification of the properties of metal overlayers on Nb(110) and Ta(110), 12:16241 (R;US)
Forecasting
Calculation of emission scenarios for passenger cars in the Netherlands, 12:16208 (R;NL;DU)
Hydrogenation
Chemical trapping of CO/H_2 surface species: Quarterly report, 12:15286 (R;US)
Monitoring
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species. Final report, period ending June 1986, 12:16706 (R;US)
High-resolution coherent anti-Stokes Raman spectroscopy measurements of carbon monoxide linewidths in a flame, 12:15370 (BA;US)
Production
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)

CARBON STEELS
Corrosion
Effects of gamma radiolysis on waste package components, 12:16263 (R;US)
Radioactive waste isolation in salt: Peer review of the Office of Nuclear Waste Isolation's draft report on a multifactor test design to investigate uniform corrosion of low-carbon steel, 12:16237 (R;US)
Protective Coatings
Protective coatings and claddings: Application/evaluation (Coatings were applied by chromizing, aluminizing, or simultaneously aluminizing/chromizing pack-diffusion processes), 12:15272 (R;US)
Quantitative Chemical Analysis
Determination of La, Ce, Pr and Nd in carbon steels by optical emission spectroscopy (OES), 12:16379 (R;IN)
Radiation Effects
Effects of gamma radiolysis on waste package components, 12:16263 (R;US)

CARBONIC ACID
Equilibrium
Calculation of the carbonic acid equilibria taking into consideration complex formation of calcium and magnesium and the presence of phosphate, ammonia and boric acid, 12:16404 (R;DE;In German)
Water Chemistry
Calculation of the carbonic acid equilibria taking into consideration complex formation of calcium and magnesium and the presence of phosphate, ammonia and boric acid, 12:16404 (R;DE;In German)

CARCINOGEN SCREENING
Coordinated Research Programs
Action of tumor initiators and promoters in the Syrian hamster embryo cell transformation assay, 12:16902 (RA;US)

CARCINOMAS
Images
Synthesis of 1-(p-isothiocyanatobenzyl) derivatives of DTPA and EDTA. Antibody labeling and tumor-imaging studies, 12:16841 (J;US)

CARDIOVASCULAR DISEASES
See also HYPERTENSION
Pathogenesis
Effects of complex organic mixtures of coal liquid on cardiovascular function, 12:15338 (RA;US)

CAROTENOIDS
Biosynthesis
Oxygen-regulated mRNAs for light-harvesting and reaction center complexes and for bacteriochlorophyll and carotenoid biosynthesis in Rhodobacter capsulatus during the shift from anaerobic to aerobic growth, 12:16796 (J;US)
CARS SPECTROSCOPY
See RAMAN SPECTROSCOPY
CASCADE SHOWERS
Properties of the EM cascade: A tutorial utilizing high resolution 3D color graphics, 12:17325 (R;US)
CASCADE SOLAR CELLS
Graded Band Gaps
Research on multi-band-gap solar cells: Annual subcontract report, 1 April 1985-31 March 1986, 12:15614 (R;US)
Research Programs
Research on multi-band-gap solar cells: Annual subcontract report, 1 April 1985-31 March 1986, 12:15614 (R;US)
CATALYSTS
Chemical Preparation
A new method of magnetic characterization of zeolite-cobalt catalysts: Quarterly technical progress report 5, Oct. 1, 1986 through Jan. 30, 1987, 12:16403 (R;US)
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Final quarterly technical progress report No. 4 for the period 1 July to 30 September 1986, 12:15284 (R;US)
Chemical Reactions
Gas-phase chemical reactions of transition metal clusters with simple molecules, 12:16401 (R;US)
NMR Spectra
A new method of magnetic characterization of zeolite-cobalt catalysts: Quarterly technical progress report 5, Oct. 1, 1986 through Jan. 30, 1987, 12:16403 (R;US)
Performance
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)
Pt-Ti alloy formation from high-temperature reduction of a titania-impregnated Pt catalyst: implications for strong metal-support interaction, 12:16300 (J;US)
Performance Testing
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Final quarterly technical progress report No. 4 for the period 1 July to 30 September 1986, 12:15284 (R;US)
Promoters
A new method of magnetic characterization of zeolite-cobalt catalysts: Quarterly technical progress report 5, Oct. 1, 1986 through Jan. 30, 1987, 12:16403 (R;US)
Structural Chemical Analysis
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Final quarterly technical progress report No. 4 for the period 1 July to 30 September 1986, 12:15284 (R;US)
CATAWBA-1 REACTOR
York County, South Carolina, USA
Fuel Management
Extended burnup: ex-core and accident considerations, 12:15807 (J;US)
Spent Fuel Storage
Extended burnup: ex-core and accident considerations, 12:15807 (J;US)
CATAWBA-2 REACTOR
York County, South Carolina, USA
Fuel Management
Extended burnup: ex-core and accident considerations, 12:15807 (J;US)
Spent Fuel Storage
Extended burnup: ex-core and accident considerations, 12:15807 (J;US)
CATTLE
Lethal Radiation Dose
Animal mortality resulting from uniform exposures to photon radiations: Calculated LD_{50}s and a compilation of experimental data, 12:16859 (R;US)
CAUSTIC FLOODING
Bench-Scale Experiments
Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 45, Quarter ending December 31, 1985, 12:15353 (R;US)
CELL CYCLE
Kinetics
Flow-cytometric analysis of plateau-phase mammalian cell populations, 12:16799 (RA;US)
Kinetic differences between fed and starved Chinese hamster ovary cells, 12:16815 (RA;US)
Survival of subpopulations of plateau-phase Chinese hamster ovary (CHO) cells selected by size, 12:16868 (RA;US)
CELL GROWTH (ANIMAL)
See ANIMAL CELLS GROWTH
CELL GROWTH (PLANT)
See GROWTH
CELL KILLING
Radioinduction
Alpha-particle dose distribution effects at the cellular level, 12:16871 (RA;US)
CELLS (ANIMAL)
See ANIMAL CELLS
CELLS (BACTERIAL)
See BACTERIA
CEMENT INDUSTRY
Kilns
Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln, 12:15314 (R;US)
Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln. Volume 1. Technical report. Final report, June 1983-September 1985, 12:15315 (R;US)
Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln. Volume 2. Data supplement A. Final report, June 1983-September 1985, 12:15316 (R;US)
Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln. Volume 3. Data supplement B. Final report, June 1983-September 1985, 12:15317 (R;US)
CENTRAL NUCLEAR EN ATUCHA REACTOR
See ATUCHA REACTOR
CENTRAL RECEIVER POWER PLANTS
See TOWER FOCUS POWER PLANTS
CENTRIFUGAL CONTACTORS
See EXTRACTION APPARATUSES
CERAMIC MELTERS
Off-gas chemistry study of melter feed by Springborn Laboratories, 12:15425 (R;US)
CERAMICS
Absorption Spectra
Transparent glass ceramics: Laser prospects, 12:16472 (BA;US)
Brittleness
Ceramics for fusion devices, 12:17629 (BA;US)
Chemical Composition
Transparent glass ceramics: Laser prospects, 12:16472 (BA;US)
Corrosion
Materials compatibility during the chlorination of molten $CaCl_2$. CaO salts, 12:16282 (R;US)
Crystal Doping
Transparent glass ceramics: Laser prospects, 12:16472 (BA;US)
Crystallography
Transparent glass ceramics: Laser prospects, 12:16472 (BA;US)
Emission Spectra
Transparent glass ceramics: Laser prospects, 12:16472 (BA;US)
Fracture Mechanics
Fracture mechanisms in lead zirconate titanate ceramics, 12:16338 (BA;US)
Mixed-mode fracture of ceramics, 12:16336 (BA;US)
Fracture Properties
Mixed-mode fracture of ceramics, 12:16336 (BA;US)
Grain Boundaries
Computer simulation of "special" grain boundaries in metals and ionic materials, 12:16247 (R;US)
Neutron Fluence
Radiation effects on structural ceramics in fusion, 12:17572 (J;US)

NMR Spectra
Development of nuclear magnetic resonance imaging techniques for characterizing green-state ceramic materials, 12:16327 (R;US)
Physical Radiation Effects
Ceramics for fusion devices, 12:17629 (BA;US)
Irradiation devices for fusion reactor materials results obtained from irradiated lithium aluminate at the OSIRIS reactor, 12:17429 (R;FR)
Radiation effects on structural ceramics in fusion, 12:17572 (J;US)
Porosity
Development of nuclear magnetic resonance imaging techniques for characterizing green-state ceramic materials, 12:16327 (R;US)
Temperature Effects
Fuel system and structural alloy considerations for space nuclear reactor systems, 12:15868 (BA;US)
Thermodynamic Properties
Thermodynamic performance of ceramic tritium breeding blanket material, 12:17580 (J;US)

CEREBRAL CORTEX
Autoradiography
Studies of aluminum in rat brain, 12:16884 (R;US)

CERIUM
Electronic Structure
Effects of d-integral correlation on the mixed-valence properties of cerium systems: the integral-band problem, 12:16314 (J;US)
Emission Spectroscopy
Determination of La, Ce, Pr and Nd in carbon steels by optical emission spectroscopy (OES), 12:16379 (R;IN)
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)

CERIUM ADDITIONS
Photoionization
UV laser induced photochromic centers in cerium doped calcium fluoride, 12:16351 (R;US)

CERIUM ALLOYS
See also CERIUM ADDITIONS
Physical Properties
Low temperature properties of $CeCu_6$ and related compounds, 12:16285 (R;US)
Valence
Valence instabilities in amorphous rare earth compound films, 12:16303 (J;NL)

CERIUM COMPOUNDS
See also CERIUM HYDRIDES
Electronic Structure
Effects of d-integral correlation on the mixed-valence properties of cerium systems: the integral-band problem, 12:16314 (J;US)
F States
What underlies the Anderson Hamiltonian, 12:17357 (R;US)
Hamiltonians
What underlies the Anderson Hamiltonian, 12:17357 (R;US)
Magnetic Properties
Induced magnetic form factor of $CeCu_6$, 12:17339 (R;US)
Photoconductivity
Energy transfer and non-linear optical properties at near ultraviolet wavelengths: Rare earth 4f → 5d transitions in crystals and glasses: Progress report for the period June 1, 1986 to May 31, 1987, 12:16353 (R;US)
Photoionization
Energy transfer and non-linear optical properties at near ultraviolet wavelengths: Rare earth 4f → 5d transitions in crystals and glasses: Progress report for the period June 1, 1986 to May 31, 1987, 12:16353 (R;US)

CERIUM HYDRIDES
Crystal Structure
Symmetrized coordinate method in profile analysis for commensurable structure phase transformations, 12:17349 (R;SU;In Russian)
Crystal-Phase Transformations
Symmetrized coordinate method in profile analysis for commensurable structure phase transformations, 12:17349 (R;SU;In Russian)

CESIUM
Solubility
Evaluation of Synroc-C as a second generation waste form, 12:15446 (R;US)
X-Ray Fluorescence Analysis
X-ray fluorescence method for the determination of potassium, rubidium and cesium in thoria, 12:16374 (R;IN)

CESIUM 113
Proton Emission Decay
Ground-state proton radioactivity in the region of neutron-deficient nuclei above the tin, 12:17229 (R;DE;In German)

CESIUM 134
Computerized Simulation
Release of tellurium and caesium from UO/sub 2/ in LWR fuel rods during irradiation, 12:15970 (BA;US)
Structural Chemical Analysis
Release of tellurium and caesium from UO/sub 2/ in LWR fuel rods during irradiation, 12:15970 (BA;US)

CESIUM 137
Computerized Simulation
Release of tellurium and caesium from UO/sub 2/ in LWR fuel rods during irradiation, 12:15970 (BA;US)
Structural Chemical Analysis
Release of tellurium and caesium from UO/sub 2/ in LWR fuel rods during irradiation, 12:15970 (BA;US)

CESIUM HYDROXIDES
Hygroscopicity
Effect of hygroscopicity on aerosol behavior, 12:16103 (J;US)

CHANNELS (REACTOR)
See REACTOR CHANNELS

CHARGED PARTICLES
In addition to the specific charged particles listed below, see also the list under ELEMENTARY PARTICLES.
See also ALPHA PARTICLES
BETA PARTICLES
DEUTERONS
IONS
Particle Production
Secondary particle multiplicity in the π/sup -/Ne interactions at psub(π)=6.2 Gev/c, 12:17215 (R;SU;In Russian)

CHARGED-PARTICLE ACTIVATION
See ACTIVATION ANALYSIS
CHARGED PARTICLES

CHARGED-PARTICLE TRANSPORT
Numerical solution of transport equations with particle correction, 12:17356 (R;FR;In French)
Fokker-Planck Equation
Approximation of Fokker-Planck equation by a deterministic particle method, 12:17399 (R;FR;In French)

CHARM PARTICLES
See also D MESONS
LAMBDA C PLUS
Weak Particle Decay
Heavy flavour decays and the structure of weak interactions, 12:17132 (R;DE)

CHARPAK CHAMBERS
See MULTIWIRE PROPORTIONAL CHAMBERS

CHARS
Activation Energy
Oxygen chemisorption as a tool for characterizing "young" chars, 12:15298 (J;US)
Chemical Properties
Expansion of high-temperature; high-pressure data set for coal gasification. Fifth quarterly report, September 28-December 28, 1985, 12:15279 (R;US)
Chemical Reaction Kinetics
Micropore diffusion in coal chars under reactive conditions: Quarterly technical progress report, 15 September 1986-15 December 1986, 12:15287 (R;US)
Combustion Kinetics
Single-particle combustion of Beulah lignite char, 12:15332 (BA;US)

Gasification
Micropore diffusion in coal chars under reactive conditions: Quarterly technical progress report, 15 September 1986-15 December 1986, 12:15287 (R;US)
Oxygen chemisorption as a tool for characterizing "young" chars, 12:15298 (J;US)
Mineralogy
Fundamental studies on mineral matter behavior in ash-agglomerating coal gasifiers, 12:15271 (R;US)
Petrography
Characterisation of insoluble residues from the hydrogenation of Victorian brown coals, 12:15307 (R;AU)
Fundamental studies on mineral matter behavior in ash-agglomerating coal gasifiers, 12:15271 (R;US)
Porosity
Micropore diffusion in coal chars under reactive conditions: Quarterly technical progress report, 15 September 1986-15 December 1986, 12:15287 (R;US)
Sorptive Properties
Oxygen chemisorption as a tool for characterizing "young" chars, 12:15298 (J;US)
Surface Area
Expansion of high-temperature; high-pressure data set for coal gasification. Fourth quarterly report, June 28-September 28, 1985, 12:15278 (R;US)
Expansion of high-temperature; high-pressure data set for coal gasification: Sixth quarterly report, December 28, 1985-March 28, 1986, 12:15280 (R;US)
Oxygen chemisorption as a tool for characterizing "young" chars, 12:15298 (J;US)
Yields
Expansion of high-temperature; high-pressure data set for coal gasification: Sixth quarterly report, December 28, 1985-March 28, 1986, 12:15280 (R;US)
CHEMICAL ANALYSIS
See also ACTIVATION ANALYSIS
NUCLEAR REACTION ANALYSIS
Meetings
Analysis of materials (metals, ceramics, minerals) using spectroscopic methods, 12:16390 (R;DE)
CHEMICAL EFFLUENTS
Monitoring
Effluent monitoring systems at Department of energy facilities, 12:16777 (RA;US)
CHEMICAL EXPLOSIVES
See also TATB
Detonations
An integral model of plume rise from high explosive detonations, 12:16679 (R;US)
CHEMICAL HEAT PUMPS
Working Fluids
Selection of working fluids for absorption heat pumps, 12:16204 (R;DE;In German)
CHEMICAL REACTORS
Design
Effects of coal structure on pulverized coal combustion processes: Quarterly technical progress report No. 5 for the period September 1, 1986 to 31 December 1986, 12:15303 (R;US)
Expansion of high-temperature; high-pressure data set for coal gasification. Fourth quarterly report, June 28-September 28, 1985, 12:15278 (R;US)
The U-GAS process for producing gas from coal, 12:15275 (R;US)
Transformations of inorganic coal constituents in combustion systems: Quarterly report No. 1 for the period October-December 1986, 12:15328 (R;US)
Fluidized Beds
Silicon production in a fluidized bed reactor: Final report, 12:15606 (R;US)
Fuel Feeding Systems
Entrained flow gasification at elevated pressure: Quarterly technical progress report No. 7 for the period 1 September 1986 to 30 November 1986, 12:15281 (R;US)
Mixing
Micromixing and multiple steady state transitions in a CSTR, 12:16419 (J;GB)
Modifications
Expansion of high-temperature; high-pressure data set for coal gasification: Sixth quarterly report, December 28, 1985-March 28, 1986, 12:15280 (R;US)
Performance
Micromixing and multiple steady state transitions in a CSTR, 12:16419 (J;GB)
CHEMICALS
See PIGMENTS
REAGENTS
CHEMISTRY (WATER)
See WATER CHEMISTRY
CHERENKOV COUNTERS
Cherenkov radiation ring spectrometers with hodoscopic photomultipliers for measurement of particle velocity with momentum up to 300 GeV/c, 12:16613 (R;SU;In Russian)
CHERENKOV DETECTORS
See CHERENKOV COUNTERS
CHERNOBYLSK-1 REACTOR
Power Distribution
Calculation technique and results of nonstationary fields of energy release in RBMK reactors, 12:15962 (R;SU;In Russian)
CHERNOBYLSK-4 REACTOR
Reactor Accidents
Chernobyl accident: An overview of causes and effects, 12:16031 (R;CH;In German)
Environmental radioactivity and radiation exposure in southern Bavaria after the Chernobyl accident, 12:16768 (R;DE;In German)
Nuclear Safety: Technical progress review, January-March 1987, 12:16063 (R;US)
CHINA
Bilateral Agreements
Treaty Series No. 60 (1985) - Agreement between the Government of the United Kingdom of Great Britain and Northern Ireland and the Government of the People's Republic of China for Co-operation in the Peaceful Uses of Nuclear Energy with exchange of letters - London, 3 June 1985, 12:17683 (R;GB)
Intergovernmental Cooperation
Treaty Series No. 60 (1985) - Agreement between the Government of the United Kingdom of Great Britain and Northern Ireland and the Government of the People's Republic of China for Co-operation in the Peaceful Uses of Nuclear Energy with exchange of letters - London, 3 June 1985, 12:17683 (R;GB)
Nuclear Power
Economic efficiency of nuclear power in the People's Republic of China, 12:15887 (RA;XA)
Nuclear Power Plants
Background for and experience with Qinshan project in China, 12:15874 (RA;XA)
Slowpoke Type Reactors
Application of the Miniature Neutron Source Reactor, 12:15989 (RA;XA)
Control system for the MNSR (Miniature Neutron Source Reactor), 12:15958 (RA;XA)
MNSR - A satisfactory tool for training and teaching (Miniature Neutron Source Reactor), 12:15990 (RA;XA)
MNSR Reactor (Miniature Neutron Source Reactor), 12:15988 (RA;XA)
Technology Transfer
Treaty Series No. 60 (1985) - Agreement between the Government of the United Kingdom of Great Britain and Northern Ireland and the Government of the People's Republic of China for Co-operation in the Peaceful Uses of Nuclear Energy with exchange of letters - London, 3 June 1985, 12:17683 (R;GB)
CHINESE HAMSTER
See HAMSTERS
CHINESE HAMSTER OVARY CELLS
See CHO CELLS
CHIRAL SYMMETRY
More on the first order chiral symmetry transition in QCD, 12:17160 (R;US)

CHITIN
Biodegradation
Anaerobic chitin degradation as a carbon and hydrogen source for sulfate reduction and methanogenesis in salt marsh bacteria, 12:16826 (RA;US)
CHLAMYDOMONAS
Biological Pathways
Effect of light and development of photosynthetic cells: Final report, 12:15602 (R;US)
Biological Radiation Effects
Linear energy transfer (LET) effects on repair rate, 12:16864 (RA;US)
Carbon Dioxide Fixation
Model of carbon dioxide assimilation in Chlamydomonas reinhardii, 12:16810 (J;DE)
Irradiation
Positive ion irradiation facility, 12:16862 (RA;US)
Temperature Effects
Linear energy transfer (LET) effects on repair rate, 12:16864 (RA;US)
CHLORIDES
See also BARIUM CHLORIDES
CALCIUM CHLORIDES
MERCURY CHLORIDES
MOLYBDENUM CHLORIDES
Corrosive Effects
Fundamental corrosion characterization of high-strength titanium alloys, 12:16320 (BA;US)
CHLORINATED AROMATIC HYDROCARBONS
Biodegradation
Letter to the Editor, 12:16909 (J;US)
Toxicity
Letter to the Editor, 12:16909 (J;US)
CHLORINE 37 TARGET
Neutrino Reactions
Solar neutrino experiments, 12:17106 (RA;CS)
CHLORINE 39
Secondary Beams
Production of secondary radioactive beams from 44 MeV/u Ar projectiles, 12:16559 (R;FR)
CHLORINE COMPOUNDS
See also CHLORIDES
OXYCHLORIDES
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
CHLOROPHYLL
Biosynthesis
Oxygen-regulated mRNAs for light-harvesting and reaction center complexes and for bacteriochlorophyll and carotenoid biosynthesis in Rhodobacter capsulatus during the shift from anaerobic to aerobic growth, 12:16796 (J;US)
CHO CELLS
Autoradiography
Kinetic differences between fed and starved Chinese hamster ovary cells, 12:16815 (RA;US)
Biological Radiation Effects
Alpha-particle dose distribution effects at the cellular level, 12:16871 (RA;US)
Sublethal damage is not the same as potentially lethal damage, 12:16867 (RA;US)
Survival of subpopulations of plateau-phase Chinese hamster ovary (CHO) cells selected by size, 12:16868 (RA;US)
Enzyme Activity
Mechanism of mutagen-induced deoxynucleoside triphosphate imbalance in Chinese hamster ovary (CHO-K1) cells, 12:16869 (RA;US)
Genetic Radiation Effects
Comparative in vitro and in vivo models of cytotoxicity and genotoxicity, 12:16901 (RA;US)
Mechanism of mutagen-induced deoxynucleoside triphosphate imbalance in Chinese hamster ovary (CHO-K1) cells, 12:16869 (RA;US)
Radiation Dose Distributions
Alpha-particle dose distribution effects at the cellular level, 12:16871 (RA;US)
Radiation Injuries
Dose-rate evidence for two kinds of radiation damage in stationary-phase mammalian cells, 12:16866 (RA;US)
CHROMATOGRAPHY
Data Acquisition Systems
On-line ion chromatography system, 12:16395 (R;US)
CHROMIUM
Emission Spectroscopy
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Quality of leachate from retorted oil shale wetted with treated process waters, 12:15375 (R;US)
Superlattices
Elastic properties of superlattices (Nb/Cu; Au/Cr; Mo/Ni), 12:16260 (R;US)
Waste Disposal
Evaluation of potential mixed wastes containing lead, chromium, used oil, or organic liquids, 12:15439 (R;US)
X-Ray Fluorescence Analysis
Determination of Ti, Cr, Cu and Ta in niobium oxide by X-ray fluorescence method, 12:16381 (R;IN)
CHROMIUM 47
Half-Life
Uncertainties in scientific measurements, 12:17216 (R;US)
CHROMIUM 50
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
CHROMIUM 50 TARGET
Nickel 58 Reactions
Ground-state proton radioactivity in the region of neutron-deficient nuclei above the tin, 12:17229 (R;DE;In German)
CHROMIUM 52
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
CHROMIUM 52 TARGET
Neutron Reactions
/sup 52/Cr(n,xnγ)reactions at 14.6 MeV studied by coincident in-beam techniques, 12:17220 (RA;CS)
CHROMIUM 53
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
CHROMIUM 53 TARGET
Carbon 12 Reactions
Application of hot spot conception to analysis of spectra from reactions with light bombarding nuclei, 12:17225 (R;SU;In Russian)
CHROMIUM 54
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
CHROMIUM ALLOYS
See also INCONEL ALLOYS
STAINLESS STEELS
VANSTAR 7

Corrosion Resistance
Passivation of P-implanted Fe-Cr amorphous alloys, 12:16297 (R;US)
Ion Implantation
Passivation of P-implanted Fe-Cr amorphous alloys, 12:16297 (R;US)
Passivation
Passivity of amorphous Ni-Cr-P alloys, 12:16296 (R;US)
Physical Radiation Effects
Detection of near-surface ^{53}Cr segregation in irradiated $^{51}V(Cr)$ by RBS [Rutherford Backscattering Spectrometry] (Rutherford backscattering spectrometry; V-15%Cr), 12:16257 (R;US)
Ion-induced spinodal-like decomposition of Fe-Ni-Cr Invar alloys, 12:16277 (R;US)

CHROMIUM OXIDES
Dispersion Hardening
Transformation toughening in the $Al_2O_3Cr_2O_3$ /ZrO_2 - HPO_2 system: the effect of ZrO_2-HFO_2 content, 12:16337 (BA;US)
Fracture Properties
Transformation toughening in the $Al_2O_3Cr_2O_3$ /ZrO_2 - HPO_2 system: the effect of ZrO_2-HFO_2 content, 12:16337 (BA;US)

CHROMIUM-MOLYBDENUM STEELS
See also ALLOY-HT-9
Protective Coatings
Protective coatings and claddings: Application/evaluation (Coatings were applied by chromizing, aluminizing, or simultaneously aluminizing/chromizing pack-diffusion processes), 12:15272 (R;US)

CHROMODYNAMICS
See QUANTUM CHROMODYNAMICS

CIRCULAR POINT COLLECTORS

CLIMATE MODELS
Sensitivity Analysis
Effects of dynamic heat fluxes on model climate sensitivity: meridional sensible and latent heat fluxes, 12:16759 (J;US)

CLIMATES
Biological Indicators
Tree ring chronology indexes and reconstructions of precipitation in Central Iowa, USA, 12:16689 (R;US)
Data Acquisition
Design and use of climatological data banks, with emphasis on the preparation and homogenization of surface monthly records, 12:16772 (J;NL)
Environmental Effects
Radiodensitometric tree-ring analysis along altitudinal gradients: Some alternative procedures for detecting site, climatic, and potential CO_2 effects on tree growth, 12:16773 (R;US)
Variations
Analytical solution for the effect of increasing CO_2 on global mean temperature, 12:16761 (J;GB)
Effects of dynamic heat fluxes on model climate sensitivity: meridional sensible and latent heat fluxes, 12:16759 (J;US)
Model study of the greenhouse effects due to increasing atmospheric CH_4, N_2O, CF_2Cl_2, and $CFCl_3$, 12:16760 (J;US)
Possible changes in future use of fossil fuels to limit environmental effects, 12:16758 (BA;US)

CLUSTERS (FUEL ELEMENTS)
See FUEL ELEMENT CLUSTERS

CLUSTERS (GALAXY)

CNG PROCESS
Equipment
CNG acid gas removal process: Technical progress report No. 5, 1 October-31 December 1984, 12:15277 (R;US)
Research Programs
CNG acid gas removal process: Technical progress report No. 5, 1 October-31 December 1984, 12:15277 (R;US)

CO2 FLOODING
See CARBON DIOXIDE INJECTION

COAL
See also BROWN COAL
SUBBITUMINOUS COAL
Cleaning
Development of a microwave coal cleaning process: Technical progress report for March 1985-May 1985, 12:15283 (R;US)
Cocombustion
Select use of coal and natural gas in utility boilers. A manual for evaluating environmental, technical, and legal aspects: one way to overcome foreign-oil dependency, 12:15680 (R;US)
Combustion
Computer simulation of pulverized coal combustion in various CO_2/O_2 atmospheres and in air, 12:15326 (R;US)
Combustion Products
Transformations of inorganic coal constituents in combustion systems: Quarterly report No. 1 for the period October-December 1986, 12:15328 (R;US)
Cost
Possible short and long term evolution in the cost of PWRs nuclear fuel and coal, 12:15405 (RA;XA)
Deashing
Development of a microwave coal cleaning process: Technical progress report for March 1985-May 1985, 12:15283 (R;US)
Demetallization
Enhancement of coal quality by microbial demetalization and desulfurization, 12:15269 (R;US)
Desulfurization
Development of a microwave coal cleaning process: Technical progress report for March 1985-May 1985, 12:15283 (R;US)
Enhancement of coal quality by microbial demetalization and desulfurization, 12:15269 (R;US)
Fluidized-Bed Combustion
Comprehensive report to Congress: Clean Coal Technology program: Tidd PFBC [pressurized fluidized-bed combustion] demonstration project, 12:15327 (R;US)
Hydrogenation
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Leaching
Enhancement of coal quality by microbial demetalization and desulfurization, 12:15269 (R;US)
Maritime Transport
Establishment of data bank on the self-heating of coal. Final report, 12:15325 (R;US)
Meetings
Proceedings: 1985 international conference on coal science, 12:15267 (B;AU)
Microstructure
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
Mixing
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Nuclear Magnetic Resonance
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
Oxidation
Mild oxidative solubilization of coal macerals, 12:15300 (R;US)
Performance Testing
Pilot plant evaluation of Illinois No. 6 and Pittsburgh No. 8 coal for the Texaco coal gasification process: Final report, 12:15288 (R;US)
Petrology
Mild oxidative solubilization of coal macerals, 12:15300 (R;US)
Pneumatic Transport
Advanced research in instrumentation and control technology: Multiphase flow studies, 12:15323 (R;US)
Porosity
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
Processing
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)

Pyrolysis
Effects of coal structure on pulverized coal combustion processes: Quarterly technical progress report No. 5 for the period September 1, 1986 to 31 December 1986, 12:15303 (R;US)
Expansion of high-temperature; high-pressure data set for coal gasification. Fourth quarterly report, June 28-September 28, 1985, 12:15278 (R;US)
Expansion of high-temperature; high-pressure data set for coal gasification. Fifth quarterly report, September 28-December 28, 1985, 12:15279 (R;US)
Expansion of high-temperature; high-pressure data set for coal gasification: Sixth quarterly report, December 28, 1985-March 28, 1986, 12:15280 (R;US)
Research Programs
Proceedings: 1985 international conference on coal science, 12:15267 (B;AU)
Sorptive Properties
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
Spontaneous Combustion
Establishment of data bank on the self-heating of coal. Final report, 12:15325 (R;US)
Surface Area
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)

COAL FINES
Combustion
Experimental investigation of the formation of nitrogen oxides in combustion of coal dust. 2nd intermediate report covering the period from May 1, 1983 to June 30, 1984, 12:15329 (R;DE;In German)
Combustion Kinetics
A comparison of the evolution of particle size distributions during combustion for coal and coal/water slurries, 12:15333 (BA;US)
Electric Charges
Water removal characteristics of fine coal particles, 12:15268 (R;DE;In German)
Particle Size
A comparison of the evolution of particle size distributions during combustion for coal and coal/water slurries, 12:15333 (BA;US)
Pneumatic Transport
Advanced research in instrumentation and control technology: Multiphase flow studies, 12:15323 (R;US)
Water Removal
Water removal characteristics of fine coal particles, 12:15268 (R;DE;In German)

COAL GASIFICATION
See also TEXACO GASIFICATION PROCESS
U-GAS PROCESS
Catalysts
Catalyzed steam gasification of low-rank coals to produce hydrogen, 12:15583 (J;US)
Steam gasification of carbonaceous solids catalyzed by a mixture of potassium and nickel oxides below 1000 K, 12:15297 (J;US)
Chemical Reactors
Entrained flow gasification at elevated pressure: Quarterly technical progress report No. 7 for the period 1 September 1986 to 30 November 1986, 12:15281 (R;US)
Expansion of high-temperature; high-pressure data set for coal gasification. Fifth quarterly report, September 28-December 28, 1985, 12:15279 (R;US)
Expansion of high-temperature; high-pressure data set for coal gasification: Sixth quarterly report, December 28, 1985-March 28, 1986, 12:15280 (R;US)
Energy Sources
Analysis of a two-stream direct coal-gasification system, 12:15296 (BA;US)
Entrainment
Entrained flow gasification at elevated pressure: Quarterly technical progress report No. 7 for the period 1 September 1986 to 30 November 1986, 12:15281 (R;US)
Fluidized Beds
Fundamental studies on mineral matter behavior in ash-agglomerating coal gasifiers, 12:15271 (R;US)
Hot Gas Cleanup
Study of high temperature removal of alkali of a pressurized gasification system: Final report, 12:15276 (R;US)
Mathematical Models
Entrained flow gasification at elevated pressure: Quarterly technical progress report No. 7 for the period 1 September 1986 to 30 November 1986, 12:15281 (R;US)
Meetings
Proceedings: 1985 international conference on coal science, 12:15267 (B;AU)
Research Programs
Expansion of high-temperature; high-pressure data set for coal gasification. Fourth quarterly report, June 28-September 28, 1985, 12:15278 (R;US)
Expansion of high-temperature; high-pressure data set for coal gasification: Sixth quarterly report, December 28, 1985-March 28, 1986, 12:15280 (R;US)

COAL GASIFICATION PLANTS
Chemical Effluents
Interaction of trace species with the molten carbonate fuel cell: Task report No. 12, 12:16193 (R;US)
Materials Testing
Protective coatings and claddings: Application/evaluation, 12:15272 (R;US)
Measuring Instruments
Advanced research in instrumentation and control technology: Capacitance flowmeter, 12:15273 (R;US)
Waste Water
Low-rank coal research: Quarterly technical progress report for the period April-June 1986, 12:15310 (R;US)

COAL LIQUEFACTION
Meetings
Proceedings: 1985 international conference on coal science, 12:15267 (B;AU)
Tracer Techniques
Investigation of coal hydrogenation using deuterium as an isotopic tracer, 12:15308 (BA;US)

COAL LIQUEFACTION PLANTS
Chars
Characterisation of insoluble residues from the hydrogenation of Victorian brown coals, 12:15307 (R;AU)
Materials Testing
Evaluation of advanced materials for severe slurry erosion service: Final report, 12:15290 (R;US)
Measuring Instruments
Development of an in-situ hydrogen measuring instrument for coal liquefaction processes: Quarterly report, October-December 1986, 12:15285 (R;US)
Pumps
Evaluation of advanced materials for severe slurry erosion service: Final report, 12:15290 (R;US)
Valves
Evaluation of advanced materials for severe slurry erosion service: Final report, 12:15290 (R;US)

COAL LIQUIDS
Carcinogen Screening
Compilation of toxicological, chemical and engineering data on coal conversion process materials: status and summary of results, 12:15340 (RA;US)
Initiation-promotion studies with complex mixtures, 12:15341 (RA;US)
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Tumor-promoting activity of complex organic mixtures, 12:15342 (RA;US)
Carcinogenesis
Metabolism of polycyclic aromatic hydrocarbons in coal-derived complex mixtures applied to mouse skin, 12:15335 (RA;US)
Chemical Composition
Investigation of extraction of a model mixture similar to coal oil with supercritical gases, 12:15289 (R;DE;In German)
Chemical Properties
Determination of chemical properties and toxicologic activity of hydroaromatic species in coal liquefaction products, 12:15292 (RA;US)

Chemical Reaction Yield
Investigation of coal hydrogenation using deuterium as an isotopic tracer, 12:15308 (BA;US)
Mass Spectra
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Metabolites
Characterization of metabolites and DNA adducts arising from direct coal liquids exposure, 12:15291 (RA;US)
Mixtures
Metabolism of polycyclic aromatic hydrocarbons in coal-derived complex mixtures applied to mouse skin, 12:15335 (RA;US)
Mutagen Screening
Chemical characterization of materials from a close-coupled catalytic-catalytic two-stage coal liquefaction process, 12:15293 (RA;US)
Complex mixtures: comparative chemical and toxicological characterization, 12:15336 (RA;US)
Mutagenesis
Effects of highly aromatic complex chemical mixtures on the mutagenicity of amino-PAH, nitro-PAH and the intercalating agent, ICR191, 12:15343 (RA;US)
NMR Spectra
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Quantitative Chemical Analysis
Structural characterization/correlation of calorimetric properties of coal fluids: Fifth quarterly report, September 1, 1986-December 31, 1986, 12:15304 (R;US)
Specific Heat
Structural characterization/correlation of calorimetric properties of coal fluids: Fifth quarterly report, September 1, 1986-December 31, 1986, 12:15304 (R;US)
Structural Chemical Analysis
Structural characterization/correlation of calorimetric properties of coal fluids: Fifth quarterly report, September 1, 1986-December 31, 1986, 12:15304 (R;US)
Supercritical Gas Extraction
Investigation of extraction of a model mixture similar to coal oil with supercritical gases, 12:15289 (R;DE;In German)
Teratogenesis
Developmental effects in rats and mice after dermal exposure to a high-boiling complex organic mixture, 12:15337 (RA;US)
Toxicity
Compilation of toxicological, chemical and engineering data on coal conversion process materials: status and summary of results, 12:15340 (RA;US)
Complex mixtures: comparative chemical and toxicological characterization, 12:15336 (RA;US)
Determination of chemical properties and toxicologic activity of hydroaromatic species in coal liquefaction products, 12:15292 (RA;US)
Developmental effects in rats and mice after dermal exposure to a high-boiling complex organic mixture, 12:15337 (RA;US)
Effects of complex organic mixtures of coal liquid on cardiovascular function, 12:15338 (RA;US)
Lifetime studies with mice after exposure to a high-boiling complex organic mixture, 12:15339 (RA;US)

COAL PREPARATION
Meetings
Proceedings: 1985 international conference on coal science, 12:15267 (B;AU)

COAL SEAMS
In-Situ Combustion
Experimental and theoretical studies of reverse combustion in porous media, 12:15331 (BA;US)

COAL TAR
Carcinogen Screening
Compilation of toxicological, chemical and engineering data on coal conversion process materials: status and summary of results, 12:15340 (RA;US)
Tumor-promoting activity of complex organic mixtures, 12:15342 (RA;US)
Chemical Analysis
Chemical analysis of coal-derived materials in commercial use, 12:15299 (RA;US)
Mass Spectroscopy
Supercritical fluid chromatography and mass spectrometry, 12:15294 (RA;US)
Supercritical Fluid Chromatography
Supercritical fluid chromatography and mass spectrometry, 12:15294 (RA;US)
Toxicity
Chemical analysis of coal-derived materials in commercial use, 12:15299 (RA;US)
Compilation of toxicological, chemical and engineering data on coal conversion process materials: status and summary of results, 12:15340 (RA;US)
Yields
Expansion of high-temperature; high-pressure data set for coal gasification: Sixth quarterly report, December 28, 1985-March 28, 1986, 12:15280 (R;US)

COAL-DERIVED LIQUIDS
See COAL LIQUIDS

COAL-OIL MIXTURES
See COAL FUEL SLURRIES

COATED FUEL PARTICLES
Burnable Poisons
Integral fuel burnable absorber experience in two- and three-loop cores, 12:15956 (J;US)

COATINGS
See also PROTECTIVE COATINGS
Corrosion
Materials compatibility during the chlorination of molten $CaCl_2$. CaO salts, 12:16282 (R;US)
Materials Testing
Materials compatibility during the chlorination of molten $CaCl_2$. CaO salts, 12:16282 (R;US)

COAXIAL CABLES
Data Transmission
Device for digital data transmission by a coaxial cable, 12:16490 (R;SU;In Russian)

COBALT
Catalytic Effects
A new method of magnetic characterization of zeolite-cobalt catalysts: Quarterly technical progress report 5, Oct. 1, 1986 through Jan. 30, 1987, 12:16403 (R;US)
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Geochemistry
Thermochemical study of the distribution of cobalt and nickel between diopsidic pyroxene and melt, 12:16931 (J;US)
NMR Spectra
A new method of magnetic characterization of zeolite-cobalt catalysts: Quarterly technical progress report 5, Oct. 1, 1986 through Jan. 30, 1987, 12:16403 (R;US)

COBALT 59 TARGET
Lithium 6 Reactions
Application of hot spot conception to analysis of spectra from reactions with light bombarding nuclei, 12:17225 (R;SU;In Russian)
Neutron Reactions
Neutron scattering on nuclei near A = 60 and A = 90, 12:17257 (R;US)
Uncertainties in scientific measurements, 12:17216 (R;US)

COBALT 60
Production
Cobalt processing - flask positioner location sensing system, 12:15843 (J;US)

COCOMBUSTION
Manuals
Select use of coal and natural gas in utility boilers. A manual for evaluating environmental, technical, and legal aspects: one way to overcome foreign-oil dependency, 12:15680 (R;US)

COFIRING
See COCOMBUSTION
COGENERATION
Prior to November 1980, this concept was indexed to CO-GENERATION.
See COGENERATION
Energy Supplies
Short-distance heat supply - introduction, 12:16216 (RA;DE;In German)
COGENERATION PLANTS
See DUAL-PURPOSE POWER PLANTS
COHERENT ANTI-STOKES RAMAN SPECTROSCOPY
See RAMAN SPECTROSCOPY
COILS (MAGNETIC)
See MAGNET COILS
COINCIDENCE METHODS
Data Processing
Method of processing data and evaluating uncertainty in $4\pi\beta$-γ coincidence measurement, 12:16597 (R;CN;In Chinese)
COINCIDENCE SPECTROMETRY
Corrections
Accidental-coincidence corrections, 12:16667 (J;US)
Electronic Circuits
Measuring the third factorial moment; application to neutron correlation assay, 12:16666 (J;US)
Mathematical Models
Hybrid Monte Carlo/analytical model of neutron coincidence counting, 12:16665 (J;US)
Performance
Rejection of outliers in thermal neutron coincidence counting, 12:16668 (J;US)
Status of in-plant neutron coincidence counting, 12:16663 (J;US)
COLD PLASMA
Electromagnetic Radiation
High-frequency broadband emission from turbulent plasmas, 12:17424 (BA;US)
COLLISIONAL PLASMA
ECR Heating
Electron cyclotron resonance heating of a high-density plasma, 12:17416 (R;DK)
COLOGNE SPIRITS
See ETHANOL
COLORADO
Mill Tailings
Final environmental impact statement: Remedial actions at the former Climax Uranium Company uranium mill site, Grand Junction, Mesa County, Colorado: Volume 2, Appendices, 12:15562 (R;US)
Final environmental impact statement: Remedial actions at the former Climax Uranium Company uranium mill site, Grand Junction, Mesa County, Colorado: Volume 1, Text, 12:15561 (R;US)
Oil Shale Deposits
Assay products from Green River oil shale, 12:15373 (R;US)
COLUMBIUM
See NIOBIUM
COLUMNS (MECHANICAL)
See MECHANICAL STRUCTURES
COMBINED GAS AND STEAM CYCLE POWER PLANTS
See COMBINED-CYCLE POWER PLANTS
COMBINED STEAM-POWER GENERATION
See COGENERATION
COMBINED-CYCLE POWER PLANTS
Prior to March, 1976, the descriptors COMBINED CYCLES and FOSSIL-FUEL POWER PLANTS or THERMAL POWER PLANTS were used for indexing this concept.
Demonstration Programs
Comprehensive report to Congress: Clean Coal Technology program: Tidd PFBC [pressurized fluidized-bed combustion] demonstration project, 12:15327 (R;US)
Materials
Materials for large land-based gas turbines. Final report, 1984-1986, 12:15737 (R;US)
COMBUSTION
See also COCOMBUSTION
IN-SITU COMBUSTION
Computer Calculations
Computer simulation of pulverized coal combustion in various CO_2/O_2 atmospheres and in air, 12:15326 (R;US)
Controlled Atmospheres
Computer simulation of pulverized coal combustion in various CO_2/O_2 atmospheres and in air, 12:15326 (R;US)
Meetings
Proceedings: 1985 international conference on coal science, 12:15267 (B;AU)
COMBUSTION CHAMBERS
Turbulent Flow
User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor, 12:16499 (R;US)
COMBUSTION KINETICS
Mathematical Models
Simulations of turbulent mixing and reacting flows and their applications to turbulence modeling. Semiannual progress report, 12:16433 (R;US)
COMBUSTION PRODUCTS
Mutagen Screening
Analysis of coal and coal liquid combustion products, 12:15330 (RA;US)
Stack Disposal
Characterization of stack emissions from municipal refuse-to-energy systems. Final report, 12:16715 (R;US)
COMETS
See also HALLEY COMET
Ammonia
Advanced infrared astronomy, 12:16971 (RA;US)
Planetary submillimeter spectroscopy, 12:16979 (RA;US)
Carbon Dioxide
Advanced infrared astronomy, 12:16971 (RA;US)
Carbon Isotopes
Continued program of planetary study at the University of Texas McDonald Observatory, 12:16988 (RA;US)
Outer planet studies, 12:16981 (RA;US)
Spectroscopic observations of the planets, 12:16986 (RA;US)
Carbon Monoxide
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)
Chemical Composition
Cometary spectroscopy, 12:17007 (RA;US)
Composition of faint comets, 12:17000 (RA;US)
Continued program of planetary study at the University of Texas McDonald Observatory, 12:16988 (RA;US)
High resolution spectral imagery of comets, 12:17013 (RA;US)
Spatially resolved quantitative spectroscopy of comets, 12:17014 (RA;US)
Chemical Properties
Spectroscopy of comets, 12:17017 (RA;US)
Cosmic Dust
International Halley Watch: discipline specialists for near-nucleus studies, 12:17027 (RA;US)
Cosmic Gases
International Halley Watch: discipline specialists for near-nucleus studies, 12:17027 (RA;US)
Data Compilation
Atlas of Comet Halley 1910 II, 12:16999 (RA;US)
Data Transmission Systems
International Halley Watch: discipline specialists for spectroscopy and spectrophotometry, 12:17028 (RA;US)
Emission Spectra
Composition of faint comets, 12:17000 (RA;US)
International Halley Watch: discipline specialists for photometry and polarimetry, 12:17024 (RA;US)
Hydrocyanic Acid
International Halley Watch: discipline specialists for radio science, 12:17025 (RA;US)
Hydrogen
Ground-based observation of Comet Halley, 12:17012 (RA;US)
Hydroxyl Radicals
International Halley Watch: discipline specialists for radio science, 12:17025 (RA;US)
Infrared Spectra
Cometary spectroscopy, 12:17007 (RA;US)

International Halley Watch: discipline specialists for infrared spectroscopy and radiometry, 12:17026 (RA;US)
International Halley Watch: discipline specialists for spectroscopy and spectrophotometry, 12:17028 (RA;US)
Planetary infrared astronomy using a cryogenic postdisperser on Fourier transform spectrometers, 12:16977 (RA;US)
Planetary spectroscopy, 12:17005 (RA;US)
Magnetic Fields
High-resolution imaging of solar system objects, 12:16975 (RA;US)
Imaging studies of comets, 12:16998 (RA;US)
Magnetoacoustic Waves
Steepened magnetosonic waves in the high β plasma surrounding Comet Giacobini-Zinner, 12:16967 (R;US)
Maps
Studies of asteroids and comets, 12:16997 (RA;US)
Mass
Spatially resolved quantitative spectroscopy of comets, 12:17014 (RA;US)
Mathematical Models
Physical processes in comets, 12:17011 (RA;US)
Microwave Spectra
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)
Molecular Ions
International Halley Watch: discipline specialists for near-nucleus studies, 12:17027 (RA;US)
Optical Properties
Optical investigation of Comet Halley, 12:17006 (RA;US)
Oxygen
Ground-based observation of Comet Halley, 12:17012 (RA;US)
Physical Properties
Infrared imaging and photometry of Comet Giacobini-Zinner, 12:17002 (RA;US)
Spectroscopy of comets, 12:17017 (RA;US)
Plasma
Imaging studies of comets, 12:16998 (RA;US)
Plasma Jets
International Halley Watch: discipline specialists for near-nucleus studies, 12:17027 (RA;US)
Satellite Atmospheres
Extended atmospheres of outer planet satellites and comets. Annual report, 1 August 1985-31 July 1986, 12:17031 (R;US)
Spectra
Observations of comets and asteroids, 12:16994 (RA;US)
Planetary research at Lowell Observatory, 12:16995 (RA;US)
Planetary astronomy, 12:17003 (RA;US)
Spin
International Halley Watch: discipline specialists for near-nucleus studies, 12:17027 (RA;US)
Surface Properties
International Halley Watch: discipline specialists for near-nucleus studies, 12:17027 (RA;US)
Surveys
Research in planetary astronomy at Palomar Observatory, 12:16990 (RA;US)
Water
Ground-based observation of Comet Halley, 12:17012 (RA;US)
Infrared observations of planets, 12:17008 (RA;US)
Water Vapor
Advanced infrared astronomy, 12:16971 (RA;US)

COMMERCIAL BUILDINGS
Decommissioning
Decontamination and decommissioning of a luminous dial painting facility: radiological characterization, segregation and disposal of building materials, 12:15548 (RA;US)
Decontamination
Decontamination and decommissioning of a luminous dial painting facility: radiological characterization, segregation and disposal of building materials, 12:15548 (RA;US)
Decontamination of an Americium-241 site, 12:15552 (RA;US)

COMMERCIAL SECTOR
Fuel Consumption
Multistate EIA-857 respondent report 1984: Final report, 12:15366 (R;US)

COMMON MARKET
Energy Policy
The EEC Wind Energy R&D Programme, 1985-1988, 12:15658 (BA;US)
Wind Power
The EEC Wind Energy R&D Programme, 1985-1988, 12:15658 (BA;US)

COMPACT IGNITION TOKAMAK
A Tokamak proposed as a next-step after TFTR, i.e., for extensive ignited-core studies.
Activation Analysis
Activation analysis of the Compact Ignition Tokamak, 12:17598 (J;US)
Cooling
Liquid nitrogen cooling considerations of the Compact Ignition Tokamak, 12:17538 (J;US)
Design
Activation analysis of the Compact Ignition Tokamak, 12:17598 (J;US)
Configuration development and structural assessment of the FEDC Ignitor concept, 12:17494 (J;US)
Liquid nitrogen cooling considerations of the Compact Ignition Tokamak, 12:17538 (J;US)
First Wall
First wall and vacuum vessel analysis for Compact Ignition Tokamaks, 12:17507 (J;US)
Magnet Coils
Configuration development and structural assessment of the FEDC Ignitor concept, 12:17494 (J;US)
Liquid nitrogen cooling considerations of the Compact Ignition Tokamak, 12:17486 (R;US)
Liquid nitrogen cooling considerations of the Compact Ignition Tokamak, 12:17538 (J;US)
System studies of Compact Ignition Tokamaks, 12:17535 (J;US)
Maintenance
Maintenance features of the Compact Ignition Tokamak fusion reactor, 12:17432 (R;US)
Neutron Spectra
Activation analysis of the Compact Ignition Tokamak, 12:17598 (J;US)
Poloidal Field Divertors
PF coil system comparisons for a compact ignition device, 12:17536 (J;US)
Reactor Maintenance
Maintainability features of the Compact Ignition Tokamak, 12:17570 (J;US)
Reviews
Overview of the Compact Ignition Tokamak, 12:17493 (J;US)
Physics guidelines for the Compact Ignition Tokamak, 12:17492 (J;US)
Shields
Activation analysis of the Compact Ignition Tokamak, 12:17598 (J;US)
Superconducting Magnets
Sliding joint and bond development program for the Alcator C-Mod toroidal field coils, 12:17608 (J;US)
T Codes
System studies of Compact Ignition Tokamaks, 12:17535 (J;US)
Vacuum Systems
First wall and vacuum vessel analysis for Compact Ignition Tokamaks, 12:17507 (J;US)

COMPACT TORUS
Prior to October 1982, this concept was indexed to THERMONUCLEAR DEVICES or to a particular experiment if known, e.g., REVERSE-FIELD PINCH.
Acceleration
Compact torus compression of microwaves, 12:17462 (RA;US)
Charged-Particle Transport
FRC plasma transport studies with 1-D plus modified Hill's vortex radial profiles, 12:17468 (RA;US)
Magnet Coils
Experimental and numerical study of various methods of programmed formation on TRX-2, 12:17463 (RA;US)
Magnetic Field Configurations
Experimental and numerical study of various methods of programmed formation on TRX-2, 12:17463 (RA;US)

Generalization of the Taylor Principle, 12:17479 (RA;US)
Mode beating model of ac helicity injection, 12:17478 (RA;US)
Performance
Axial dynamics in field-reversed theta-pinches, 12:17471 (RA;US)
FRC formation studies on FRX-C with Z-discharge ionization, 12:17470 (RA;US)
FRX-C/T large source modification, 12:17473 (RA;US)
ICF drivers: A comparison of some new entries and old standbys, 12:17556 (J;US)
Proposed FRX-D experiment, 12:17474 (RA;US)
Recent FRC translation experiments on FRX-C/T, 12:17469 (RA;US)
Plasma Diagnostics
Nd:Glass lasers for Thomson scattering plasma diagnostics on the compact toroid transport experiment, 12:17422 (BA;US)
Wave Propagation
Compact torus compression of microwaves, 12:17462 (RA;US)
COMPLEX MANIFOLDS
Metrics
Kaehler-Einstein invariant metrics on compact homogeneous manifolds, 12:17367 (R;SU;In Russian)
SU Groups
Kaehler-Einstein invariant metrics on compact homogeneous manifolds, 12:17367 (R;SU;In Russian)
COMPONENT COOLING SYSTEMS
See AUXILIARY WATER SYSTEMS
COMPOSITE MATERIALS
Compatibility
Assessment of ceramic composites for multimegawatt space nuclear power systems, 12:15867 (R;US)
Nondestructive Testing
Damage assessment in composites by acoustic-ultrasonic technique. Final report, September 1985-August 1986, 12:16346 (R;US)
COMPOUND NUCLEI
Decay
Study of cluster emission by excited compound nuclei, 12:17293 (R;SU;In Russian)
Evaporation Model
Study of cluster emission by excited compound nuclei, 12:17293 (R;SU;In Russian)
COMPOUNDS (ORGANIC)
See ORGANIC COMPOUNDS
COMPRESSOR BLADES
Failures
Detection of turbomachine blading problems using on and off-line monitoring, 12:15689 (RA;US)
COMPUTER CALCULATIONS
Methods, not results.
D Codes
Research on and applications of non-linear costs functions in the Dutch energy models SELPE and DELPE, 12:16152 (R;NL;DU)
S Codes
Research on and applications of non-linear costs functions in the Dutch energy models SELPE and DELPE, 12:16152 (R;NL;DU)
COMPUTER CODES
Computer codes are indexed by their initial letter and CODES, e.g., A CODES. If the code name begins with a number the code is indexed to NUMBER CODES.
See also A CODES
D CODES
F CODES
G CODES
H CODES
O CODES
P CODES
R CODES
S CODES
B Codes
User manual for BUNVIS-RG: an exact buckling and vibration program for lattice structures, with repetitive geometry and substructuring options, 12:16444 (R;US)
Data-Flow Processing
A pipelined solution method of tridiagonal linear equation systems, 12:17672 (BA;US)
Parallel Processing
Parallel structuring of control and resources management systems for parallel programs, 12:17670 (BA;US)
T Codes
User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor, 12:16499 (R;US)
COMPUTER GRAPHICS
Equipment
How to set up a successful production graphics facility, 12:17642 (R;US)
Management
How to set up a successful production graphics facility, 12:17642 (R;US)
COMPUTER PROGRAMS
See COMPUTER CODES
COMPUTER-AIDED MANUFACTURING
Graphics NC generation in a prototype machining laboratory: CAM report, 12:16445 (R;US)
COMPUTERIZED CONTROL SYSTEMS
Performance
Computer monitoring of pilot plant baghouse performance, 12:15750 (RA;US)
COMPUTERIZED SIMULATION
E Codes
Feedback simulation of ramped power transients using transfer functions, 12:15931 (J;US)
M Codes
Development and testing of a Monte Carlo code system for analysis of ionization chamber responses, 12:16661 (J;US)
Monte Carlo Method
Application of quasi-random numbers for simulation, 12:17650 (R;SU;In Russian)
Programming
Graduate student use of DSNP at Idaho State University, 12:15933 (J;US)
Input and control management scheme for the DSNP simulation language, 12:15935 (J;US)
PPC - an interactive preprocessor/compiler for the DSNP simulation language, 12:15932 (J;US)
Special simulation programs generated by DSNP for educational uses, 12:15934 (J;US)
Use of the DSNP simulation language in high-seed dynamic simulation of nuclear power plants, 12:15830 (J;US)
Transfer Functions
Feedback simulation of ramped power transients using transfer functions, 12:15931 (J;US)
COMPUTERS

COPEPODS
Diet
Feeding relationships of harpacticoid copepods and microbial flora in a salt marsh, 12:16827 (RA;US)
COPPER
Charged-Particle Transport
High intensity positron beam and angular correlation experiments at Livermore, 12:16312 (BA;US)
Corrosion
Corrosion of copper-based materials in gamma radiation (NNWSI project), 12:16275 (R;US)
Diffusion
Diffusion and ion mixing in amorphous alloys, 12:16249 (R;US)
Electronic Structure
Angle-resolved photoemission extended fine structure, 12:16323 (BA;US)
Emission Spectroscopy
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Extraction
Protection of ground water by immobilization of heavy metals in industrial-waste-impacted soil systems, 12:16776 (R;US)
Photoemission
Angle-resolved photoemission extended fine structure, 12:16323 (BA;US)
Physical Radiation Effects
High intensity positron beam and angular correlation experiments at Livermore, 12:16312 (BA;US)
Thermal annealing of vacancy and interstitial loops in ion irradiated copper, 12:16305 (J;US)
Radiation Effects
Corrosion of copper-based materials in gamma radiation (NNWSI project), 12:16275 (R;US)
Superlattices
Elastic properties of superlattices (Nb/Cu; Au/Cr; Mo/Ni), 12:16260 (R;US)
Surface Coating
Magnetic properties of novel epitaxial films, 12:16254 (R;US)
Surface Properties
Modification of the properties of metal overlayers on Nb(110) and Ta(110), 12:16241 (R;US)
Vacancies
Calculation of the properties of vacancy clusters in copper using a new, efficient energy minimization scheme, 12:16251 (R;US)
X-Ray Fluorescence Analysis
Determination of Ti, Cr, Cu and Ta in niobium oxide by X-ray fluorescence method, 12:16381 (R;IN)

X-Ray Spectra
Angle-resolved photoemission extended fine structure, 12:16323 (BA;US)
COPPER 63 TARGET
Alpha Reactions
Pion multiplicity in α-nucleus reactions from 200 to 800 A. MeV, 12:17205 (R;FR)
COPPER 67
Radioimmunoassay
Which collimator for SPECT with I-123 and CU-67, 12:16820 (J;US)
Therapeutic Uses
Which collimator for SPECT with I-123 and CU-67, 12:16820 (J;US)
COPPER ALLOYS
See also COPPER BASE ALLOYS
Physical Properties
Low temperature properties of $CeCu_6$ and related compounds, 12:16285 (R;US)
Valence
Valence instabilities in amorphous rare earth compound films, 12:16303 (J;NL)
COPPER BASE ALLOYS
See also BRONZE
Corrosion
Corrosion of copper-based materials in gamma radiation (NNWSI project), 12:16275 (R;US)
Radiation Effects
Corrosion of copper-based materials in gamma radiation (NNWSI project), 12:16275 (R;US)
COPPER COMPOUNDS
See also COPPER SELENIDES
Magnetic Properties
Induced magnetic form factor of $CeCu_6$, 12:17339 (R;US)
COPPER SELENIDES
Crystal Growth
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Microhardness
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Photoconductivity
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
COPPER VAPOR LASERS
See GAS LASERS
CORES (DRILL)
See DRILL CORES
CORES (REACTOR)
See REACTOR CORES
CORIOLIS FORCE
Convection
Convection-driven dynamos, 12:16943 (RA;CS)
CORONA (SOLAR)
See SOLAR CORONA
CORROSION INHIBITORS
Coordinated Research Programs
Evaluation and use of iron dispersants in the Con Edison System, 12:15723 (RA;US)
CORROSION PRODUCTS
Mass Transfer
Corrosion product transport in a cycling fossil plant, 12:15735 (RA;US)
Transport of chemicals in steam cycles, 12:15718 (RA;US)
Removal
Transport of chemicals in steam cycles, 12:15718 (RA;US)
CORTEX (CEREBRAL)
See CEREBRAL CORTEX
CORUNDUM
See also RUBY
Electron Collisions
Defects and color centers induced in corundum and ruby by high energy electrons. 3. Optical properties of corundum irradiated by high energy electrons, 12:17344 (R;SU;In Russian)
F Centers
Defects and color centers induced in corundum and ruby by high energy electrons. 3. Optical properties of corundum irradiated by high energy electrons, 12:17344 (R;SU;In Russian)
COSMETICS
See CONSUMER PRODUCTS
COSMIC DUST
Absorption Spectra
Infrared observations of planets, 12:17008 (RA;US)
Origin
Interplanetary and interstellar dust, 12:17023 (RA;US)
Water
Infrared observations of planets, 12:17008 (RA;US)
COSMIC GAMMA RAYS
See COSMIC PHOTONS
COSMIC GAMMA SOURCES
Gamma Spectrometers
Gamma-ray spectrometer experiment on the solar maximum mission satellite. Final report, 16 October 1984-15 April 1986, 12:17041 (R;US)
COSMIC NUCLEI
Prior to July , 1975 information was indexed to NUCLEI.
Acceleration
Ultraheavy cosmic rays: Propagation and selective acceleration, 12:16936 (RA;US)
Particle Production
Stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances, 12:16938 (RA;US)
Ultraheavy cosmic rays: Propagation and selective acceleration, 12:16936 (RA;US)
COSMIC PARTICLES
See COSMIC RADIATION
COSMIC PHOTONS
Prior to July, 1975 information was indexed to PHOTONS.
Secondary Emission
Secondary production of gamma rays in the Jovian magnetosphere, 12:16937 (RA;US)
COSMIC RADIATION
From sources other than the sun; not for SOLAR RADIATION.
See also COSMIC NUCLEI
COSMIC PHOTONS
Energy Spectra
Heavy element compositions and energy spectra of galactic and solar cosmic rays, 12:16940 (R;FR;In French)
Faculae
Solar-Geophysical Data Number 504, August 1986. Part 1 (prompt reports). Data for July 1986, June 1986, and late data, 12:17050 (R;US)
Fluctuations
Cosmic ray fluctuations at rigidities 4 to 180 GV, 12:16962 (R;HU)
Measuring Methods
Solar-Geophysical Data Number 505, September 1986. Part 1 (prompt reports). Data for August 1986, July 1986, and late data, 12:17052 (R;US)
Meetings
Contributions to the 18th International Cosmic Ray Conference, 12:16935 (R;US)
Monitoring
Solar-Geophysical Data Number 504, August 1986. Part 1 (prompt reports). Data for July 1986, June 1986, and late data, 12:17050 (R;US)
COSMIC RADIO SOURCES
See also BL LACERTAE OBJECTS
PULSARS
QUASARS
SUPERNOVA REMNANTS
Emission Spectra
Continuum radiation from active galactic nuclei: a statistical study, 12:17039 (R;US)
X Radiation
Variability studies of 3C 371. Final report, 1 April 1985-30 September 1986, 12:16968 (R;US)

COSMIC RAY DETECTION
Neutron Monitors
On the possibility of using a neutron supermonitor in the ANI complex experiment, 12:16604 (R;SU;In Russian)
COSMIC RAY SPECTROMETERS
Data Processing
Design principle and structure of the ANI data centre, 12:16609 (R;SU)
Versatile Data Processing Unit (DPU) for satellite-borne composition instrumentation, 12:16939 (RA;US)
COSMIC X RAYS
See COSMIC PHOTONS
COSMIC X-RAY SOURCES
Emission Spectra
Continuum radiation from active galactic nuclei: a statistical study, 12:17039 (R;US)
COSMOGONY
See COSMOLOGY
COSMOLOGICAL MODELS
Cosmology and galaxy formation. An introduction to some recent ideas, 12:17048 (R;DK)
Primordial shear and the question of inflation, 12:17047 (R;DK)
Elementary Particles
Inflation in a wall dominated universe, 12:17392 (BA;US)
Hubble Effect
Inflation in a wall dominated universe, 12:17392 (BA;US)
Supersymmetric inflation: Recent progress, 12:17390 (BA;US)
The behavior of the Higgs field in the new inflationary universe, 12:17391 (BA;US)
The new inflationary universe, 1984, 12:17389 (BA;US)
Kaluza-Klein Theory
More dimensions - Less inflation, 12:17393 (BA;US)
Mass Distribution
Inflation in a wall dominated universe, 12:17392 (BA;US)
The behavior of the Higgs field in the new inflationary universe, 12:17391 (BA;US)
The new inflationary universe, 1984, 12:17389 (BA;US)
Phase Transformations
Inflation in a wall dominated universe, 12:17392 (BA;US)
Supersymmetric inflation: Recent progress, 12:17390 (BA;US)
Reviews
The new inflationary universe, 1984, 12:17389 (BA;US)
Scalar Fields
The behavior of the Higgs field in the new inflationary universe, 12:17391 (BA;US)
Supersymmetry
Supersymmetric inflation: Recent progress, 12:17390 (BA;US)
COSMOLOGY
Elementary Particles
Inflation in a wall dominated universe, 12:17392 (BA;US)
Kaluza-Klein Theory
More dimensions - Less inflation, 12:17393 (BA;US)
COSMOS
See UNIVERSE
COSTA RICA
Carbon Cycle
Land use change and carbon exchange in the tropics. I. Detailed estimates for Costa Rice, Panama, Peru, and Bolivia, 12:16765 (J;US)
COUNTERFLOW COOLING TOWERS
See COOLING TOWERS
COUNTERS (RADIATION)
See RADIATION DETECTORS
COUNTING CIRCUITS
Automation
Improving the precision and range of cell survival assays, 12:16865 (RA;US)
Design
Improving the precision and range of cell survival assays, 12:16865 (RA;US)
CP INVARIANCE
Symmetry Breaking
CP violation in heavy flavor decays: Predictions and search strategies, 12:17157 (J;NL)
Problems of CP-violation in early unification theories, 12:17162 (R;SU)
CRACK GROWTH
See CRACK PROPAGATION
CRACK PROPAGATION
Finite Element Method
Elastic-plastic finite element analysis of a rotating cylinder containing an internal, axial crack, 12:16291 (R;GB)
CRACKS
Detection
Radiometric detection of cracks on stationary and moving surfaces, 12:15707 (RA;US)
Monitoring
Eddy current on-line monitoring for crack detection, 12:15706 (RA;US)
CRANES
Failures
Hot canyon crane operating problems and equipment failures: F-Canyon Reprocessing Facility, Savannah River Plant, 12:15386 (R;US)
CRICETULUS
See HAMSTERS
CRITICALITY
Computer Calculations
Different perspectives on the use of personal computers for technical analyses, 12:16449 (J;US)
CRITICALITY ACCIDENTS
See CRITICALITY
RADIATION ACCIDENTS
CROSS SECTIONS
See also TOTAL CROSS SECTIONS
Data Covariances
Covariances of evaluated nuclear data based upon uncertainty information of experimental data and nuclear models, 12:17192 (R;US)
CROSSFLOW COOLING TOWERS
See COOLING TOWERS
CRUCIBLES
Materials Testing
Materials compatibility during the chlorination of molten $CaCl_2$. CaO salts, 12:16282 (R;US)
CRUDE OIL
See PETROLEUM
CRYOPUMPS
Efficiency
Losses in fountain-effect pumps, 12:16443 (R;US)
CRYOSTATS
Stability
Theoretical assessment of a proposal for the simplified determination of critical loads of elastic shells, 12:17437 (R;DE)
CRYSTAL DEFECTS
Electronic Structure
Theoretical studies of defects in binary and ternary oxides, 12:16329 (R;US)
CRYSTAL RIVER-3 REACTOR
Citrus, Florida, USA
Outages
New time-line technique for station blackout core-melt analysis, 12:16122 (J;US)
Reactor Core Disruption
New time-line technique for station blackout core-melt analysis, 12:16122 (J;US)
CRYSTAL STRUCTURE
See also CRYSTAL DEFECTS
Temperature Dependence
Further aspects of the structure and magnetism of the layered compound Fe(III)ClMoO$_4$: Moessbauer spectroscopy, susceptibility, and powder neutron diffraction studies, 12:16335 (J;US)
CRYSTALS
See also IONIC CRYSTALS
MONOCRYSTALS
POLYCRYSTALS
Physical Radiation Effects
To the theory of radiation-induced pores in crystals, 12:16279 (RA;SU;In Russian)

Porosity
To the theory of radiation-induced pores in crystals, 12:16279 (RA;SU;In Russian)
CTX SPHEROMAK
Electric Conductivity
Local drift parameter, j/n/sub e/ and resistivity anomaly measurements in CTX spheromaks, 12:17450 (RA;US)
Electrodes
Los Alamos Spheromak Program, 12:17447 (RA;US)
Electron Drift
Local drift parameter, j/n/sub e/ and resistivity anomaly measurements in CTX spheromaks, 12:17450 (RA;US)
Magnetic Field Configurations
Determination of CTX equilibria, 12:17448 (RA;US)
Multimode evolution of the decaying spheromak, 12:17460 (RA;US)
Plasma Confinement
Increased particle confinement with the use of external dc bias field in the CTX spheromak, 12:17449 (RA;US)
Los Alamos Spheromak Program, 12:17447 (RA;US)
Plasma Guns
Energy efficiency of the CTX magnetized coaxial plasma source, 12:17452 (RA;US)
Recent helicity source and power supply improvements to CTX, 12:17453 (RA;US)
Plasma Instability
Determination of CTX equilibria, 12:17448 (RA;US)
Power Supplies
Recent helicity source and power supply improvements to CTX, 12:17453 (RA;US)
Pulse Generators
Recent helicity source and power supply improvements to CTX, 12:17453 (RA;US)
CURIUM
Ion Exchange Chromatography
High-sensitive and quantitative in-line monitoring method for transplutonium elements separation processes, 12:15382 (R;CN;In Chinese)
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
CURIUM 248 TARGET
Calcium 48 Reactions
Competition between fusion and quasi-fission in heavy ion induced reactions, 12:17242 (R;US)
CYANOBACTERIA
Biological Adaptation
Constant phycobilisome size in chromatically adapted cells of the cyanobacterium Tolypothrix tenuis, and variation in Nostoc sp, 12:16806 (J;US)
Light intensity adaptation and phycobilisome composition of Microcystis aeruginosa, 12:16807 (J;US)
Phycobilisomes
Constant phycobilisome size in chromatically adapted cells of the cyanobacterium Tolypothrix tenuis, and variation in Nostoc sp, 12:16806 (J;US)
Light intensity adaptation and phycobilisome composition of Microcystis aeruginosa, 12:16807 (J;US)
CYCLONE SEPARATORS
Fire Prevention
Performance improvement and fire prevention in fly ash collection system at a 50MW wood fired power plant, 12:15752 (RA;US)
Modifications
Performance improvement and fire prevention in fly ash collection system at a 50MW wood fired power plant, 12:15752 (RA;US)
CYCLOTRONS
See also ISOCHRONOUS CYCLOTRONS
VARIABLE ENERGY CYCLOTRONS
Beam Separators
Some proposals on mass separation, precision mass spectrometry and acceleration of radioactive nuclides, 12:16561 (R;SU;In Russian)
CYLINDERS
Objects of cylindrical shape. For containers see headings such as GAS CYLINDERS.
Crack Propagation
Elastic-plastic finite element analysis of a rotating cylinder containing an internal, axial crack, 12:16291 (R;GB)
Fluid Flow
A laser Doppler method for noninvasive measurement of flow velocity, 12:16478 (R;US)
Rotation
Elastic-plastic finite element analysis of a rotating cylinder containing an internal, axial crack, 12:16291 (R;GB)
CYTOPLASM
Biophysics
Numerical studies of unreactive contractile networks, 12:16802 (J;US)
Dynamic Function Studies
Cell motion, contractile networks, and the physics of interpenetrating reactive flow, 12:16801 (J;US)
Numerical studies of unreactive contractile networks, 12:16802 (J;US)
Flow Models
Cell motion, contractile networks, and the physics of interpenetrating reactive flow, 12:16801 (J;US)
CZECHOSLOVAKIA
Reactor Sites
Present status of geological and geophysical work at selected nuclear power plant sites in Czechoslovakia, 12:15966 (RA;CS;In Czech)

D

D CODES
Deriving properties of systems from properties of parts and lists of connections, 12:17640 (R;US)
D MESONS
Prior to Jan. 1985 this information was indexed with the descriptor D-1865 RESONANCES.
Weak Particle Decay
CP violation in heavy flavor decays: Predictions and search strategies, 12:17157 (J;NL)
D PLUS RESONANCES
See D MESONS
D ZERO RESONANCES

Power Reactors
Interregional technical co-operation project on small and medium power reactors, 12:15880 (RA;XA)
Presentation of main results of Phase I of the SMPR project initiation study, 12:15877 (RA;XA)
DIABLO CANYON-1 REACTOR
Avila Beach, California, USA
Emergency Plans
Criteria for waste-related risks to be below regulatory concern, 12:15456 (J;US)
Reactor Cooling Systems
Plant experience with temporary reverse osmosis makeup water systems, 12:15824 (J;US)

Reactor Cores
PC-based flux mapping data collection system, 12:15829 (J;US)
Reactor Licensing
Criteria for waste-related risks to be below regulatory concern, 12:15456 (J;US)

DIABLO CANYON-2 REACTOR
Avila Beach, California, USA
Emergency Plans
Criteria for waste-related risks to be below regulatory concern, 12:15456 (J;US)
Reactor Cooling Systems
Plant experience with temporary reverse osmosis makeup water systems, 12:15824 (J;US)
Reactor Licensing
Criteria for waste-related risks to be below regulatory concern, 12:15456 (J;US)

DIAPHRAGMS (THERMONUCLEAR DEVICE)
See LIMITERS

DIELDRIN
Biodegradation
Preliminary investigation of organisms capable of degrading dieldrin and aromatic compounds: techniques for isolation and characterization, 12:16830 (RA;US)

DIESEL ENGINES
Air Pollution Monitoring
A comparison of the evolution of particle size distributions during combustion for coal and coal/water slurries, 12:15333 (BA;US)
Design
Compound cycle engine program, 12:16228 (R;US)
Fuel Substitution
A comparison of the evolution of particle size distributions during combustion for coal and coal/water slurries, 12:15333 (BA;US)
Research Programs
Compound cycle engine program, 12:16228 (R;US)

DIESEL FUELS
Exhaust Gases
Comparative in vitro and in vivo models of cytotoxicity and genotoxicity, 12:16901 (RA;US)

DIESEL OIL (FRACTION)
See DIESEL FUELS

DIETHYLENETRIAMINEPENTAACETIC ACID
See DTPA

DIFFERENTIAL EQUATIONS
Numerical Solution
CALTECH: DOE program on numerical analysis, computing and fundamental studies in fluid mechanics: Summary report No. 12, April 1, 1986-March 31, 1987, 12:17087 (R;US)

DIFFUSION
Chemical potential in a stressed solid, 12:17341 (R;US)

DIGESTER GAS
See METHANE

DIOPSIDE
Cobalt
Thermochemical study of the distribution of cobalt and nickel between diopsidic pyroxene and melt, 12:16931 (J;US)
Nickel
Thermochemical study of the distribution of cobalt and nickel between diopsidic pyroxene and melt, 12:16931 (J;US)
Phase Studies
Direct measurement of the enthalpy of fusion of diopside, 12:16927 (J;US)
Temperature Effects
Direct measurement of the enthalpy of fusion of diopside, 12:16927 (J;US)

DIPHENYLPHOSPHINE OXIDE
See ORGANIC PHOSPHORUS COMPOUNDS

DIRAC EQUATION
Potentials
External field Dirac equation with separable potential, 12:17383 (R;HU)
Vacuum States
Probing for Dirac vacuum structure in nuclei, 12:17300 (J;NL)

DIRAC MONOPOLES
See MAGNETIC MONOPOLES

DIRECT ENERGY CONVERTERS
See also FUEL CELLS
MHD GENERATORS
RADIOISOTOPE BATTERIES
Design
Direct converter design for the MINIMARS Tandem Mirror Reactor, 12:17555 (J;US)

DIRECT GAIN SYSTEMS
Prior to September 1980 HEAT GAIN was used to index this concept.
Computerized Simulation
PCMSOL: Simulation code for a passive solar structure incorporating phase change materials, 12:15622 (R;US)
P Codes
PCMSOL: Simulation code for a passive solar structure incorporating phase change materials, 12:15622 (R;US)
Phase Change Materials
PCMSOL: Simulation code for a passive solar structure incorporating phase change materials, 12:15622 (R;US)

DISCHARGES (ELECTRIC)
See ELECTRIC DISCHARGES

DISINTEGRATION (NUCLEAR)
See DECAY

DISMANTLING (FUEL ASSEMBLY)
See FUEL ASSEMBLY DISMANTLING

DISMANTLING (REACTOR)
See REACTOR DISMANTLING

DISPLACEMENT RATES
Embrittlement
Calculation of damage cross section, 12:17305 (R;IN)
Neutron Reactions
Calculation of damage cross section, 12:17305 (R;IN)

DISSOLVED MATERIALS
See SOLUTES

DISSOLVED OXYGEN
See OXYGEN

DISTRICT HEATING
Cogeneration
Energy supply in communities and industry: Short-distance heat supply - economical and unhazardous to the environment. Documentation, 12:15670 (R;DE;In German)
Dual-Purpose Power Plants
Energy supply in communities and industry: Short-distance heat supply - economical and unhazardous to the environment. Documentation, 12:15670 (R;DE;In German)
Short-distance heat supply in Rottweil with cogeneration systems and heat pumps, 12:15675 (RA;DE;In German)
Strengths and weaknesses of cogeneration units - application of small and medium size cogeneration plants in short-distance heating systems, 12:15672 (RA;DE;In German)
Pipelines
Simulation of heat losses and ground temperatures for district-heating culverts. Comparison with field experiments for well-insulated, damaged, and extra-insulated culverts, 12:16227 (R;US)

DNA
See also RECOMBINANT DNA
Autoradiography
DNA synthesis studies in pre-meiotic mouse oogenesis, 12:16842 (J;CH)
Biological Radiation Effects
Three methods to determine the yields of DNA double-strand breaks, 12:16858 (R;SU)
Electrophoresis
Quantitation of radiation-, chemical-, or enzyme-induced single strand breaks in nonradioactive DNA by alkaline gel electrophoresis: application to pyrimidine dimers, 12:16882 (J;US)

DNA ADDUCTS
Chemical Analysis
Analysis of DNA adducts using trace organic analytical techniques, 12:16896 (RA;US)

DOGS
Biological Radiation Effects
Collaborative Radiological Health Laboratory annual report 1985: health effects of prenatal and postnatal whole-body exposure to ionizing radiation in the beagle dog, 12:16860 (R;US)

Lethal Radiation Dose
Animal mortality resulting from uniform exposures to photon radiations: Calculated LD_{50}s and a compilation of experimental data, 12:16859 (R;US)
DOLOMITE
Fluid Flow
Interpretation of the convergent-flow tracer tests conducted in the Culebra dolomite at the H-3 and H-4 hydropads at the Waste Isolation Pilot Plant (WIPP) site, 12:15449 (R;US)
Hydrology
A modeling study of the Culebra dolomite, 12:16921 (R;US)
Interpretation of the convergent-flow tracer tests conducted in the Culebra dolomite at the H-3 and H-4 hydropads at the Waste Isolation Pilot Plant (WIPP) site, 12:15449 (R;US)
DOMESTIC WASTES
See MUNICIPAL WASTES
DONKEYS
See BURROS
DOORS
Seals
Close-fitting shield doors with sculptured edges, 12:15391 (J;US)
DOPAMINE
Receptors
Improved delineation of human dopamine receptors using [18F]-N-methylspiroperidol and PET, 12:16816 (J;US)
DORMITORIES
See RESIDENTIAL BUILDINGS
DOSE LIMITS
Standards
Dose guidelines for decontamination and decommissioning projects, 12:15493 (RA;US)
National and international considerations of a de minimis dose, 12:15491 (RA;US)
DOSE RATES
S Codes
SHARDA - a program for sample heat, activity, reactivity and dose analysis, 12:17304 (R;IN)
DOSEMETERS
Sensitivity
Personnel neutron dosimetry using CR-39 foils, 12:16879 (R;US)
DOSIMETERS
See DOSEMETERS
DOUBLE BETA DECAY
Lepton Number
Lepton number non-conservation and double beta decay, 12:17107 (RA;CS)
DOW PUSHER 700
See POLYAMIDES
DPA
See DISPLACEMENT RATES
DPO
See ORGANIC PHOSPHORUS COMPOUNDS
DRIFT CHAMBERS
Cylindrical Configuration
New drift chamber for the Mark II detector at the SLAC linear collider, 12:16653 (J;NL)
Design
Drift-pots for small angle elastic scattering at the Fermilab collider, 12:16657 (J;NL)
Performance
Performance of the SLD central drift chamber prototype, 12:16658 (J;NL)
Prototype results of a high resolution vertex drift chamber for the Mark II SLC upgrade detector, 12:16659 (J;NL)
Spatial Resolution
Rectangular drift tube characteristics, 12:16617 (R;SU)
Time Resolution
Rectangular drift tube characteristics, 12:16617 (R;SU)
Using pulse fall of a drift proportional tube for time resolution improvement, 12:16618 (R;SU;In Russian)
DRILL CORES
Reactivity
Reactivity analyses of Schlumberger samples, 12:16923 (R;US)
DRILL SHIPS
See OFFSHORE PLATFORMS
SHIPS
DRILLING PLATFORMS
See OFFSHORE PLATFORMS
DRINKING WATER
Design of a drinking-water-quality monitoring program, 12:16783 (R;US)
DROPLETS
Explosions
A self-similar approach to the explosion of droplets by a high energy laser beam, 12:17386 (R;US)
DRY-TYPE COOLING TOWERS
See COOLING TOWERS
D-T REACTORS
Breeding Blankets
Lithium Blanket Module (LBM) dosimetry measurements at the LOTUS 14-MeV neutron source facility, 12:17526 (J;US)
Materials Testing
Tritium breeding materials, 12:17628 (BA;US)
Performance
An evaluation of polarized fuels in a commercial deuterium/tritium tokamak reactor, 12:17539 (J;US)
Research Programs
Deuterium driven D - T fusion reactor test facility, 12:17587 (J;US)
Test Facilities
Deuterium driven D - T fusion reactor test facility, 12:17587 (J;US)
Thermonuclear Fuels
An evaluation of polarized fuels in a commercial deuterium/tritium tokamak reactor, 12:17539 (J;US)
DTO
See HEAVY WATER
TRITIUM COMPOUNDS
DTPA
Chemical Reactions
Synthesis of 1-(p-isothiocyanatobenzyl) derivatives of DTPA and EDTA. Antibody labeling and tumor-imaging studies, 12:16841 (J;US)
Labelling
Synthesis of 1-(p-isothiocyanatobenzyl) derivatives of DTPA and EDTA. Antibody labeling and tumor-imaging studies, 12:16841 (J;US)
DUAL-PURPOSE POWER PLANTS
Availability
Strengths and weaknesses of cogeneration units - application of small and medium size cogeneration plants in short-distance heating systems, 12:15672 (RA;DE;In German)
Cogeneration
Energy supply in communities and industry: Short-distance heat supply - economical and unhazardous to the environment. Documentation, 12:15670 (R;DE;In German)
Supply-technical, operational, and energy-political assessment of cogeneration plants, 12:15674 (RA;DE;In German)
Economics
Short-distance heat supply in the Ruelzheim recreation center by means of a cogeneration unit and heat pumps, 12:15676 (RA;DE;In German)
Supply-technical, operational, and energy-political assessment of cogeneration plants, 12:15674 (RA;DE;In German)
Energy Conservation
Short-distance heat supply in Rottweil with cogeneration systems and heat pumps, 12:15675 (RA;DE;In German)
Energy Supplies
Short-distance heat supply - introduction, 12:16216 (RA;DE;In German)
Supply-technical, operational, and energy-political assessment of cogeneration plants, 12:15674 (RA;DE;In German)
Heat Pumps
Combination technique: Gas heat pump/cogeneration unit - tandem heating power heat pumps, energy concept of Siemens AG, 12:15678 (RA;DE;In German)
Short-distance heat supply in the Ruelzheim recreation center by means of a cogeneration unit and heat pumps, 12:15676 (RA;DE;In German)

Internal Combustion Engines
Combination technique: Gas heat pump/cogeneration unit - tandem heating power heat pumps, energy concept of Siemens AG, 12:15678 (RA;DE;In German)
Field of application of cogeneration plants with large engines, 12:15673 (RA;DE;In German)
Systems of short-distance heat supply in modular technique, 12:15671 (RA;DE;In German)
Operation
Experiences made during planning and operation of a big cogeneration unit in a municipal facility, 12:15677 (RA;DE;In German)
Planning
Experiences made during planning and operation of a big cogeneration unit in a municipal facility, 12:15677 (RA;DE;In German)

DUBNA PULSED REACTOR
See IBR-2 REACTOR

DUCTILITY
Dynamic Loads
Ductility of materials under dynamic solicitations, 12:16243 (R;FR;In French and English)

DUKOVANY V-2 REACTOR
Dukovany, South Moravia, Czechoslovakia
Buildings
Dynamic measurement on main generating unit of Dukovany Nuclear Power Plant, 12:16056 (RA;CS;In Czech)
Occupational Safety
Safety work organization in nuclear power plant. A9. Volume 1, 12:17637 (R;CS;In Czech)
Safety work organization in nuclear power plant. A9. Volume 2. Annexes, 12:17638 (R;CS;In Czech)
Seismic Effects
Seismic load calculation for primary circuit of Dukovany Nuclear Power Plant, 12:16053 (RA;CS;In Czech)

DUSTS
See also COSMIC DUST
Air Pollution Control
Field evaluation of windscreens as a fugitive dust control measure for materials storage piles, 12:16704 (RA;US)
Process fugitive particulates - design methods for enclosures, 12:16703 (RA;US)
Air Pollution Monitoring
Measurement of fugitive emissions in a coal-fired power plant, 12:15753 (RA;US)
Indoor Air Pollution
Health-hazard evaluation report HHE-80-022-OC, Tetley, Inc., Williamsport, Pennsylvania, 12:16726 (R;US)

DYE LASERS
Rhodamines
Bibliographic study of photophysical and photochemical properties of laser dyes, 12:16465 (R;FR;In French)

DYMAC SYSTEM
See NUCLEAR MATERIALS MANAGEMENT
PLUTONIUM

DYNAMIC MATERIALS ACCOUNTABILITY SYSTEM
See NUCLEAR MATERIALS MANAGEMENT
PLUTONIUM

DYSPROSIUM
Activation Analysis
Analysis of rare earths and cadmium in reference materials: Li_2SO_4 and $MnSO_4$, 12:16386 (R;FR)

DYSPROSIUM 160 TARGET
Neutron Reactions
Inelastic scattering cross-section of fast neutrons on 160, 162, 164 Dy, 12:17231 (RA;CS)

DYSPROSIUM 162 TARGET
Neutron Reactions
Inelastic scattering cross-section of fast neutrons on 160, 162, 164 Dy, 12:17231 (RA;CS)

DYSPROSIUM 164 TARGET
Neutron Reactions
Inelastic scattering cross-section of fast neutrons on 160, 162, 164 Dy, 12:17231 (RA;CS)

E

EARLY RADIATION INJURIES
See RADIATION INJURIES

EARTH ATMOSPHERE
See also IONOSPHERE
STRATOSPHERE
TROPOSPHERE
Environmental Transport
Atmospheric CO/sub 2/ variations based on the tree-ring 13/sub C/ record, 12:16766 (BA;US)
Spectroscopy
HALOE science investigation. Semiannual progress report, February-July 1986, 12:16705 (R;US)

EAST PAKISTAN
See BANGLADESH

EBR-2 REACTOR
Computerized Control Systems
An approach to the verification of a fault-tolerant, computer-based reactor safety system: A case study using automated reasoning: Volume 2, Appendixes: Interim report, 12:16028 (R;US)
Fuel Element Failure
Breached pin performance in the EBR-II RBCB program, 12:15977 (R;US)
Fuel Elements
Thermal impact of $Na_3(U/sub\ 1\text{-}y/Pu/sub\ y/)O_4$ formation on a breached LMR fuel element, 12:15980 (R;US)
Lifetime
An integrated plant-life extension program for EBR-II [Experimental Breeder Reactor], 12:15975 (R;US)
Nuclear Fuels
Experience with EBR-II [Experimental Breeder Reactor] driver fuel, 12:15979 (R;US)
Off-normal performance of EBR-II [Experimental Breeder Reactor] driver fuel, 12:16016 (R;US)
Reactor Components
Comparisons of PRD [power-reactivity-decrements] components for various EBR-II configurations, 12:15974 (R;US)
Reactor Cores
Bowing of elements and changes in radial coolant temperature profile over subassembly lifetime, 12:15865 (J;US)
Reactor Instrumentation
EBR-II [Experimental Breeder Reactor-II] system surveillance using pattern recognition software, 12:15976 (R;US)
Reactor Kinetics
Delineations of power and power-to-flow feedback components of EBR-II, 12:15863 (J;US)
Reactor Operation
An integrated plant-life extension program for EBR-II [Experimental Breeder Reactor], 12:15975 (R;US)
EBR-II [Experimental Breeder Reactor-II] system surveillance using pattern recognition software, 12:15976 (R;US)
Off-normal performance of EBR-II [Experimental Breeder Reactor] driver fuel, 12:16016 (R;US)
Time constants and feedback transfer functions of EBR-II [Experimental Breeder Reactor] subassembly types, 12:15973 (R;US)

ECCS
Design
Passive steam-driven injector as ECCS for an inherently safe BWR, 12:16078 (J;US)

ECONOMIC ANALYSIS
Uses
Applications of economic analysis in gas distribution, 12:15368 (R;US)

ECR HEATING
Free Electron Lasers
Free electron masers for tokamak applications, 12:17542 (J;US)
Masers
Free electron masers for tokamak applications, 12:17542 (J;US)

EDDY CURRENTS
Limited to electric currents.

Mathematical Models
Experimental modelling of eddy currents and deflection for tokamak limiters, 12:17584 (J;US)
EDTA
Chemical Reactions
Synthesis of 1-(p-isothiocyanatobenzyl) derivatives of DTPA and EDTA. Antibody labeling and tumor-imaging studies, 12:16841 (J;US)
Labelling
Synthesis of 1-(p-isothiocyanatobenzyl) derivatives of DTPA and EDTA. Antibody labeling and tumor-imaging studies, 12:16841 (J;US)
EFFECTIVE HALF-LIFE
See BIOLOGICAL HALF-LIFE
EFFLUENTS (CHEMICAL)
See CHEMICAL EFFLUENTS
EFFLUENTS (LIQUID)
See LIQUID WASTES
EFFUSION
See DIFFUSION
EHF RADIATION
See MICROWAVE RADIATION
EIGENVALUES
Algorithms
Multiprocessor Jacobi algorithms for dense symmetric eigenvalue and singular value decompositions, 12:17668 (BA;US)
EINSTEIN GRAVITATION THEORY
See GENERAL RELATIVITY THEORY
EINSTEIN-DE SITTER MODEL
See COSMOLOGICAL MODELS
EINSTEINIUM 253
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
EINSTEINIUM 254 TARGET
Calcium 48 Reactions
Competition between fusion and quasi-fission in heavy ion induced reactions, 12:17242 (R;US)
EKU
See EREVAN SYNCHROTRON
ELECTRIC BATTERIES
Devices for production and/or storage of electrical energy from chemical reactions; excludes FUEL CELLS and RADIOISOTOPE BATTERIES.
Heating
Battery thermal modeling: The methodology and applications, 12:16148 (R;US)
Specifications
Batteries for hybrid vehicles or other high-power applications, 12:16234 (R;US)
Temperature Distribution
Battery thermal modeling: The methodology and applications, 12:16148 (R;US)
ELECTRIC CABLES
See also COAXIAL CABLES
Electrical Insulation
High-voltage cable lead-in for pulse techniques, 12:17485 (R;SU;In Russian)
ELECTRIC CONTACTS
Fabrication
Ink jet printing of silver metallization for photovoltaics: Final technical report for the period 10/1/84 through 9/30/86, 12:15607 (R;US)
Silicon solar cells with polysilicon contacts, 12:15612 (R;US)
Testing
Environmental tests of metallization systems for terrestrial photovoltaic cells, 12:15603 (R;US)
Thermal Cycling
Environmental tests of metallization systems for terrestrial photovoltaic cells, 12:15603 (R;US)
ELECTRIC DISCHARGES
Bibliographies
A bibliography and author index for electrical discharges in vacuum (1897-1984), 12:15667 (R;US)
ELECTRIC GENERATORS
Rotating generators only; excludes DIRECT ENERGY CONVERTERS.
See also ALTERNATORS
TURBOGENERATORS
Reliability
Emergency diesel generator reliability at US nuclear power plants, 12:16124 (J;US)
ELECTRIC POWER
Economics
Preparation and appraisal of electric power projects, 12:15898 (RA;XA)
Financing
Financing electric power in developing countries, 12:15884 (RA;XA)
Preparation and appraisal of electric power projects, 12:15898 (RA;XA)
Power Generation
Annual report of the electric power industry of the Federal Republic of Germany 1985. (Summary of the quarterly reports). Power generation in publicly-owned electric utilities, the industrial independent units and the Federal Railways and overall the electric power consumption in the Federal Republic of Germany, 12:16175 (R;DE;In German)
Uses
The role of electricity in glass making, 12:16217 (R;US)
ELECTRIC POWER RESEARCH INSTITUTE
See EPRI
ELECTRIC POWER SYSTEMS

ELECTRIC UTILITIES
Cooperatives
Economic challenges facing rural electric cooperatives, 12:16171 (R;US)
Data Compilation
Electric power monthly, October 1986, 12:16172 (R;US)
Economics
Economic challenges facing rural electric cooperatives, 12:16171 (R;US)
Energy Conservation
Determining the extent, benefits, cost, and timing of utility conservation and load management programs, 12:16173 (R;US)
Economic challenges facing rural electric cooperatives, 12:16171 (R;US)
Fuel Consumption
Multistate EIA-857 respondent report 1984: Final report, 12:15366 (R;US)
Load Analysis
Load modeling for power flow and transient stability computer studies: Volume 1, Summary report: Final report, 12:16174 (R;US)
Load Management
Determining the extent, benefits, cost, and timing of utility conservation and load management programs, 12:16173 (R;US)
Management
Concept of prudence and its impact, 12:16180 (J;US)
Nuclear rate regulation, 12:15914 (J;US)
Schedule reconciliation tests for management prudency determination, 12:15915 (J;US)
Search for excellence - goal setting, Ontario Hydro Nuclear Generation experience, 12:15840 (J;US)
Utility prudency issues, 12:15916 (J;US)
Program Management
Can nuclear power survive rate-of-return regulation?, 12:16178 (J;US)
Electric utility regulation - today and tomorrow, 12:16177 (J;US)
Planning for rate base treatment of large power plants, 12:16179 (J;US)
Winning the rate base battle, 12:16176 (J;US)
Rate Structure
Economic challenges facing rural electric cooperatives, 12:16171 (R;US)

Technology Transfer
EEI chemistry committee perspective - current US utility practices (Edison Electric Institute), 12:15719 (RA;US)

ELECTRICAL EQUIPMENT
See also ELECTRIC CONTACTS
ELECTRICAL INSULATORS
ELECTROMAGNETS
Reliability
Identification of test candidates for investigating the survivability of electrical equipment during severe accidents, 12:16120 (J;US)
Seismic Effects
Earthquake resistance problems of electric equipment, 12:16042 (RA;CS;In Czech)
Testing
Identification of test candidates for investigating the survivability of electrical equipment during severe accidents, 12:16120 (J;US)

ELECTRICAL INSULATION
Electromagnetic Pulses
Assess the impact of the steep-front, short duration impulse on electric power system insulation: Phase 1, Final report, 12:15668 (R;US)

ELECTRICAL INSULATORS
Testing
Development of large high-voltage pressure insulators for the Princeton TFTR [Tokamak Fusion Test Reactor] flexible transmission lines, 12:15760 (R;US)

ELECTRICITE DE FRANCE
Research Programs
DER 85: main facts, 12:15798 (R;FR;In French)

ELECTRICITY
Only for the physical phenomenon sense; for utility purposes, use ELECTRIC POWER.
Production
The cogeneration of electrical energy and useful chemicals in a solid electrolyte reactor [Final technical report], 12:16420 (R;US)

ELECTRIC-POWERED VEHICLES
See also HYBRID ELECTRIC-POWERED VEHICLES
Research Programs
Battery-powered vehicle research in South Africa, 12:16233 (R;ZA)

ELECTRODEPOSITION
Manuals
Electroforming with nickel, iron, and aluminum, 12:16298 (R;US)

ELECTRODES
Interfaces
Reversible and irreversible redox series as probes of fundamental aspects of charge transfer across InP, WSe_2, and SnS_2/acetonitrile interfaces: Progress report, May 15, 1986-May 14, 1987, 12:16423 (R;US)

ELECTROMAGNETIC ISOTOPE SEPARATORS
Meetings
Proceedings of the specialist research meeting on measurements of short-lived isotopes, 12:16646 (R;JP;In Japanese)
Seconds Living Radioisotopes
Proceedings of the specialist research meeting on measurements of short-lived isotopes, 12:16646 (R;JP;In Japanese)

ELECTROMAGNETIC LENSES
Beam Transport
Application of graphical design method to beam transport system, 12:16521 (R;CN;In Chinese)
Magnetic Fields
Quadrupole lense field potential determination by the boundary integral eguation method, 12:16527 (R;SU;In Russian)

ELECTROMAGNETIC PULSES
Assess the impact of the steep-front, short duration impulse on electric power system insulation: Phase 1, Final report, 12:15668 (R;US)
Simulation of geomagnetic currents induced in a power system by magnetohydrodynamic electromagnetic pulses, 12:15666 (R;US)

ELECTROMAGNETS
See also SUPERCONDUCTING MAGNETS
Magnetic Flux
Two dimensional analysis for magnetic flux distribution in electromagnet used for MHD applications, 12:17086 (R;IN)

ELECTRON ACCEPTOR
See ELECTRONS

ELECTRON BEAMS
Convective Instabilities
Manifestation of sleeping-instability in partially-compensated relativistic electron beams, 12:16525 (RA;SU;In Russian)

ELECTRON CHANNELING
Multiple Scattering
Suppression of multiple scattering at planar channeling of negative particles, 12:17070 (R;SU)

ELECTRON CYCLOTRON-RESONANCE HEATING
See ECR HEATING

ELECTRON DENSITY
Plasma Diagnostics
Method to measure the suprathermal density distribution by electron cyclotron emission, 12:17406 (R;DE)

ELECTRON DONOR

BARC
Biennial report for 1982 and 1983 of Electronics Division, 12:16593 (R;IN)

ELECTRON-MOLECULE COLLISIONS
Dissociation
Dissociative electron attachment, 12:17075 (RA;CS)

ELECTRON-POSITRON INTERACTIONS
On pair production of Majorana particles in collisions of polarized e/sup +/ and e/sup -/, 12:17147 (R;SU;In Russian)
Annihilation
Production of mirror fermions near the Z/sup 0/ peak, 12:17156 (J;NL)
Jets
Jets in e/sup +/-e/sup -/ collisions, 12:17110 (RA;CS)
Standard Model
Electroweak interactions and new particle searches, 12:17135 (RA;CS)

ELECTRON-RING ACCELERATORS
Electric Fields
On tolerances for random perturbations of accelerating electric field in the KUTI-20 induction accelerating system (LUEhK-20), 12:16526 (R;SU;In Russian)

ELECTRONS
See also SOLVATED ELECTRONS

Acceleration
Particle acceleration by turbulent plasmas, 12:16946 (RA;CS)
Amplitudes
Optimum undulator trajectories, 12:16532 (BA;US)
Chemical Reaction Yield
Total ion and electron yields, 12:17318 (RA;US)
Differential Cross Sections
Structured ion impact: double differential cross sections, 12:17316 (RA;US)
Motion
Optimum undulator trajectories, 12:16532 (BA;US)
Trajectories
Optimum undulator trajectories, 12:16532 (BA;US)

ELECTROSTATIC ACCELERATORS
See also TANDEM ELECTROSTATIC ACCELERATORS
Reliability
Reliability of high-voltage electron accelerators, 12:16514 (R;SU;In Russian)

ELECTROSTATIC ANALYZERS
Beam Optics
Electrostatic separator of total fusion reaction products in the heavy ion beam of Vasilisa installation, 12:16640 (R;SU;In Russian)

ELECTROSTATIC PRECIPITATORS
Design
Advanced ESFF applied to a stoker coal-fired boiler (Electrically stimulated fabric filtration), 12:15311 (RA;US)
Design of repairs to upgrade 10-year-old industrial precipitators, 12:15313 (RA;US)
Distribution of fly ash in a filter bag operating with a charged axial electrode, 12:15738 (RA;US)
Economic Analysis
Economics of advanced electrostatic stimulation of fabric filtration, 12:15743 (RA;US)
Fire Prevention
Performance improvement and fire prevention in fly ash collection system at a 50MW wood fired power plant, 12:15752 (RA;US)
Mathematical Models
Mathematical model for advanced electrically stimulated fabric filtration, 12:15740 (RA;US)
Study of electrostatically stimulated filtration fundamentals, 12:15739 (RA;US)
Modifications
Performance improvement history of inadequately performing precipitators, 12:15751 (RA;US)
Performance improvement and fire prevention in fly ash collection system at a 50MW wood fired power plant, 12:15752 (RA;US)
Operation
Advanced electrostatic fabric filtration experience at Southwestern Public Service Company, 12:15742 (RA;US)
Performance
Advanced electrostatic fabric filtration experience at Southwestern Public Service Company, 12:15742 (RA;US)
Performance Testing
Advanced ESFF laboratory test results (Electrically stimulated fabric filtration), 12:15741 (RA;US)
Advanced ESFF applied to a stoker coal-fired boiler (Electrically stimulated fabric filtration), 12:15311 (RA;US)
Distribution of fly ash in a filter bag operating with a charged axial electrode, 12:15738 (RA;US)
Performance improvement history of inadequately performing precipitators, 12:15751 (RA;US)
Study of electrostatically stimulated filtration fundamentals, 12:15739 (RA;US)
Repair
Design of repairs to upgrade 10-year-old industrial precipitators, 12:15313 (RA;US)

ELECTROSTATIC WAVES
See PLASMA WAVES

ELEMENTARY PARTICLES
See also BEAUTY PARTICLES
CHARM PARTICLES
HADRONS
LEPTONS
POSTULATED PARTICLES
Survey of research in elementary particle physics, 12:17128 (R;FR;In French)
Abundance
Inflation in a wall dominated universe, 12:17392 (BA;US)
Origin
Inflation in a wall dominated universe, 12:17392 (BA;US)

ELEMENTS
For chemical elements only.
See also METALS
Absorption Spectra
Micro-tomography using synchrotron radiation, 12:16397 (BA;US)
Air Pollution Monitoring
Plume washout and wet deposition of trace elements around the coal-fired power plant, 12:15318 (R;JP;In Japanese)
Computerized Tomography
Micro-tomography using synchrotron radiation, 12:16397 (BA;US)
Deposition
Plume washout and wet deposition of trace elements around the coal-fired power plant, 12:15318 (R;JP;In Japanese)

ELMO BUMPY TORUS
Plasma Confinement
The "ring killer" experiment: Electron confinement in the ELMO Bumpy Torus without the influence of hot-electron rings, 12:17415 (R;US)

EMC EFFECT
Experimental comparison of EMC effect in the anti *νn* and anti *νp* interactions in neon nucleus, 12:17114 (R;SU)

EMERGENCIES
See ACCIDENTS

EMERGENCY CORE COOLING SYSTEM
See ECCS

EMP
See ELECTROMAGNETIC PULSES

TRANSPORTATION SECTOR

ENDONUCLEASES
Enzyme Activity
Levels of uracil DNA glycosylase and AP endonuclease in murine B- and T-lymphocytes do not change with age, 12:16798 (J;CH)

ENERGY
See also NUCLEAR ENERGY
SOLAR ENERGY
Production
Performance profiles of major energy producers, 1985, 12:16155 (R;US)

ENERGY ABSORPTION
Biophysics
Measurement of energy deposition near heavy ion tracks, 12:17320 (RA;US)
Monte Carlo Method
Monte Carlo calculation of energy deposition and ionization yield for high energy protons, 12:17324 (RA;US)

ENERGY CONSUMPTION
See also FUEL CONSUMPTION
Long-term energy projections and novel energy systems, 12:16198 (BA;US)
Environmental Impacts
Global energy and carbon dioxide, 12:16701 (R;US)
Sectoral Analysis
Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary, 12:16153 (R;DE;In German)

ENERGY DEPOSITION
See ENERGY ABSORPTION

ENERGY MODELS
O Codes
Sensitivity analysis of ORION (Replacement cost of petroleum), 12:15362 (R;US)

ENERGY OPERATORS
See HAMILTONIANS
ENERGY POLICY
Decision Making
Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary, 12:16153 (R;DE;In German)
Planning
Energy R & D - A national opportunity, 12:16167 (BA;US)
ENERGY SOURCE DEVELOPMENT
Environmental Impact Statements
Proposed 5-year Outer Continental Shelf oil and gas leasing program, mid-1987 to mid-1992: Final environmental impact statement: Volume 1, 12:15363 (R;US)
ENERGY STORAGE SYSTEMS
Heat Transfer
Cryogenic regenerators, 12:16438 (R;IN)
ENERGY SUPPLIES
Economics
Energy supply in communities and industry: Short-distance heat supply - economical and unhazardous to the environment. Documentation, 12:15670 (R;DE;In German)
Energy Policy
Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary, 12:16153 (R;DE;In German)
Forecasting
Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary, 12:16153 (R;DE;In German)
Sectoral Analysis
Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary, 12:16153 (R;DE;In German)
ENERGY SYSTEMS
Use only in generic sense; e.g., comparisons of several energy systems or theoretical studies when system is not denoted specifically.

EPOXIDES
Cobalt Ions
Investigation of the effects of cobalt ions on epoxy properties, 12:16363 (R;US)
Mechanical Properties
Investigation of the effects of cobalt ions on epoxy properties, 12:16363 (R;US)
EPOXY COMPOUNDS
See EPOXIDES
EPRI
Feasibility Studies
Electric Power Research Institute (EPRI) study on small and medium power reactor concepts having present potential for the USA, 12:15875 (RA;XA)
Research Programs
EPRI fossil plant cycle chemistry programs, 12:15724 (RA;US)
Overview of RP2712-1, interim consensus guidelines on fossil plant cycle chemistry, 12:15720 (RA;US)
EQUATIONS
See also DIFFERENTIAL EQUATIONS
FADDEEV EQUATIONS
FIELD EQUATIONS
SUM RULES
Algorithms
A pipelined solution method of tridiagonal linear equation systems, 12:17672 (BA;US)
EQUATIONS (DIFFERENTIAL)
See DIFFERENTIAL EQUATIONS
EQUILIBRIUM PLASMA
Magnetic Monopoles
Determination of gross plasma equilibrium from magnetic multipoles, 12:17418 (J;US)
ERBIUM
Magnetic Susceptibility
Magnetic phase transitions in nanocrystalline erbium, 12:16255 (R;US)
Phase Transformations
Magnetic phase transitions in nanocrystalline erbium, 12:16255 (R;US)
EREVAN SYNCHROTRON
Beam Extraction
Characteristics of the Erevan synchrotron extracted electron e/sup -//sub 4/beam, 12:16548 (R;SU;In Russian)
Beam Transport
Calculation and modelling of electron channel with a beam small angular divergence, 12:16544 (R;SU;In Russian)
Erevan accelerator with a beam small angular divergence, 12:16545 (R;SU;In Russian)
Electron Beams
Calculation and modelling of electron channel with a beam small angular divergence, 12:16544 (R;SU;In Russian)
On-Line Measurement Systems
Data acquisition and storage system for the e-A experimental setup on the basis of the Ehlektronika-60 microcomputer, 12:16546 (R;SU;In Russian)

Photon Beams
Experimental method for investigating γd->pn photodisintegration reaction on the linearly polarized photon beam of the Erevan synchrotron, 12:16547 (R;SU;In Russian)
Polarized Beams
Experimental method for investigating γd->pn photodisintegration reaction on the linearly polarized photon beam of the Erevan synchrotron, 12:16547 (R;SU;In Russian)

EROSION
Mathematical Models
Evaluation of advanced materials for severe slurry erosion service: Final report, 12:15290 (R;US)
Test Facilities
Evaluation of advanced materials for severe slurry erosion service: Final report, 12:15290 (R;US)

ESCHERICHIA COLI
Cell Cycle
Increase in cell mass during the division cycle of Escherichia coli B/rA, 12:16840 (J;US)
Growth
Increase in cell mass during the division cycle of Escherichia coli B/rA, 12:16840 (J;US)
Mutagenesis
Mutants of Escherichia coli affected in inducer exclusion, 12:16825 (RA;US)
Mutants
Mutants of Escherichia coli affected in inducer exclusion, 12:16825 (RA;US)

ESTUARINE ECOSYSTEMS
See AQUATIC ECOSYSTEMS

ETA MESONS
Particle Production
Differential cross section of the π/sup -/p -> eta/sup 0/Δ/sup 0/(1232) reaction at the momentum of 3.3 Gev/s, 12:17149 (R;SU;In Russian)

ETA-549
See ETA MESONS

ETHANOL
Production
Development and modelling of a gas/solid fluidized-bed fermenter for ethanol production from S. cerevisiae, 12:15590 (R;DE;In German)

ETHYL ALCOHOL
See ETHANOL

ETHYLENEDIAMINETETRAACETIC ACID
See EDTA

EUROPEAN ECONOMIC COMMUNITY
See COMMON MARKET

EUROPEAN MUON COLLABORATION EFFECT

Pairing Energy
Method to determine the pairing energy for excited nuclei, 12:17267 (RA;CS)

EXCHANGE (HEAT)
See HEAT TRANSFER

EXCITED STATES
Pairing Energy
Method to determine the pairing energy for excited nuclei, 12:17267 (RA;CS)

EXCITON MODEL
Compound-Nucleus Reactions
Exciton Model and multistep-compound reactions, 12:17266 (RA;CS)

EXHAUST GASES
Forecasting
Calculation of emission scenarios for passenger cars in the Netherlands, 12:16208 (R;NL;DU)
Mutagen Screening
Comparative in vitro and in vivo models of cytotoxicity and genotoxicity, 12:16901 (RA;US)

EXPERIMENTAL BREEDER REACTOR-2
See EBR-2 REACTOR

EXPERIMENTAL FACILITIES (ACCELERATOR)
See ACCELERATOR FACILITIES

EXPERIMENTAL REACTORS
For engineering testing of reactor components such as : FUEL ELEMENTS, COOLING SYSTEMS, etc.
See also EBR-2 REACTOR
HDR REACTOR
SEFOR REACTOR
TREAT REACTOR
VENUS REACTOR
Decommissioning
Measurements and status of a decommissioned experimental reactor - SEFOR, 12:16161 (RA;US)

EXPERT SYSTEMS
Design
Automated reasoning and knowledge base design in the scientific programming environment, 12:17643 (R;US)

EXPOSURE (RADIATION DOSES)
See RADIATION DOSES

EXTENSIVE AIR SHOWERS
Cosmic Ray Detection
Investigation of superhigh-energy cosmic rays (approximately 10/sup 20/eV) by means of a phase interferometer, 12:17057 (RA;SU;In Russian)

EXTRACTION APPARATUSES
Design
Two-dimensional peptide mapping of protease-digested proteins from two-dimensional electrophoresis gel spots, 12:16795 (R;US)

EXTRACTION (SOLVENT)
See SOLVENT EXTRACTION

EXTREMELY HIGH FREQUENCY RADIATION
See MICROWAVE RADIATION

F

F CODES
On the use of CORLIB subroutines for the solution of a model fluid flow problem, 12:17655 (R;US)
FABRIC FILTERS
Cleaning
Catenary analysis of a fabric filter bag during reverse-gas cleaning, 12:15745 (RA;US)
Performance of a high-sulfur-coal, pilot-scale fabric filter, 12:15747 (RA;US)
Design
Advanced ESFF applied to a stoker coal-fired boiler (Electrically stimulated fabric filtration), 12:15311 (RA;US)
Distribution of fly ash in a filter bag operating with a charged axial electrode, 12:15738 (RA;US)
Economic Analysis
Economics of advanced electrostatic stimulation of fabric filtration, 12:15743 (RA;US)
Materials Testing
Evaluation of acid-resistant synthetic needled felt filter media in coal-fired boiler pulse-jet baghouses, 12:16357 (RA;US)
Evaluation of a specific type of filter bag supplied by various vendors, 12:15744 (RA;US)
Mathematical Models
Aerosol deposition in fabric filters, 12:15746 (RA;US)
Mathematical model for advanced electrically stimulated fabric filtration, 12:15740 (RA;US)
Study of electrostatically stimulated filtration fundamentals, 12:15739 (RA;US)
Operation
Advanced electrostatic fabric filtration experience at Southwestern Public Service Company, 12:15742 (RA;US)
Performance
Advanced electrostatic fabric filtration experience at Southwestern Public Service Company, 12:15742 (RA;US)
Performance Testing
Advanced ESFF laboratory test results (Electrically stimulated fabric filtration), 12:15741 (RA;US)
Advanced ESFF applied to a stoker coal-fired boiler (Electrically stimulated fabric filtration), 12:15311 (RA;US)
Demonstration, operation, and testing of a fabric filter on an industrial boiler for an extended period of time. Final report, March 1981-November 1982, 12:16717 (R;US)
Distribution of fly ash in a filter bag operating with a charged axial electrode, 12:15738 (RA;US)
Evaluation of acid-resistant synthetic needled felt filter media in coal-fired boiler pulse-jet baghouses, 12:16357 (RA;US)
Evaluation of a specific type of filter bag supplied by various vendors, 12:15744 (RA;US)
Laboratory studies of the filtration performance of various filter media under simulated field conditions, 12:15312 (RA;US)
Performance of a high-sulfur-coal, pilot-scale fabric filter, 12:15747 (RA;US)
Study of electrostatically stimulated filtration fundamentals, 12:15739 (RA;US)
Stress Analysis
Catenary analysis of a fabric filter bag during reverse-gas cleaning, 12:15745 (RA;US)

FATIGUE
Crack Propagation
Grain boundary oxidation and fatigue crack growth at elevated temperatures. Final report, 12:16287 (R;US)
FATS
Chemical Radiation Effects
Changes due to radiation or thermal sterilization in vitamin A level, acidity number and peroxide value of various fats in mixes with cereals, 12:16846 (RA;CS;In Czech)
FAULT TOLERANT COMPUTERS
Systems Analysis
Toward formal analysis of ultra-reliable computers: A total systems approach, 12:17644 (R;US)
FBR TYPE REACTORS
See also LMFBR TYPE REACTORS
Neutron Reactions
Measurement and evaluation of nuclear data for nuclear power application, 12:17244 (RA;CS)
Reactor Cores
Physics considerations in the design of long-life cores, 12:15862 (J;US)
FCC LATTICES
Physical Radiation Effects
Production of freely-migrating defects during irradiation, 12:16250 (R;US)
FEDERAL GOVERNMENT
See NATIONAL GOVERNMENT
FEDERAL REGION I
Prior to June 1982 this concept was indexed to NORTH ATLANTIC REGION.
Solar Energy
New England solar energy atlas, 12:15596 (R;US)
FEDERAL REPUBLIC OF GERMANY
Electric Power
Annual report of the electric power industry of the Federal Republic of Germany 1985. (Summary of the quarterly reports). Power generation in publicly-owned electric utilities, the industrial independent units and the Federal Railways and overall the electric power consumption in the Federal Republic of Germany, 12:16175 (R;DE;In German)
Energy Consumption
Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary, 12:16153 (R;DE;In German)
Energy Policy
Wind energy utilization status of research and development in the Federal Republic of Germany, 12:15641 (BA;US)
Energy Supplies
Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary, 12:16153 (R;DE;In German)
Environmental Policy
Problems of decision-making in the fields of biology and ecology under the aspect of environmental policy, 12:16157 (R;DE;In German)
Fossil-Fuel Power Plants
Adoption of water chemistry principles in fossil power plant design and operation, 12:15728 (RA;US)
Fuel Consumption
Possibilities of longterm improvement of the structure of the energy supply in West Germany. Summary, 12:16153 (R;DE;In German)

Fuel Reprocessing Plants
Aspects of remote maintenance in an FRG reprocessing plant from the manufacturer's viewpoint, 12:15396 (J;US)
Renewable Energy Sources
Renewable energy sources and their uses - application, potentials, economic aspects, 12:16183 (RA;DE;In German)
Solar Energy
Renewable energy sources and their uses - application, potentials, economic aspects, 12:16183 (RA;DE;In German)
Wind Power
Wind energy utilization status of research and development in the Federal Republic of Germany, 12:15641 (BA;US)

FEED MATERIALS PLANTS
Decommissioning
Correlation between gamma radiation levels and soil radium concentrations at the Edgemont uranium mill site, 12:15549 (RA;US)
Health physics program for the Edgemont Uranium Mill decommissioning project, 12:15498 (RA;US)
Radiation Monitoring
Comparison of the response of a NaI scintillation crystal with a pressurized ionization chamber as a function of altitude, radiation level, and Ra-226 concentration, 12:15530 (RA;US)
Radiation Protection
Environmental monitoring requirements during remedial action and stabilization of uranium mill tailings (UMTRA project), 12:15514 (RA;US)
Site Surveys
Rapid estimation of ^{226}Ra in soil for the Grand Junction RASA/UMTRA Project, 12:15532 (RA;US)

FEEDWATER
Availability
New scenario for intersystem LOCAs in BWRs, 12:16098 (J;US)
Temperature Monitoring
Sound measures feedwater temperature within 1°F consistently, 12:15832 (J;US)
Water Chemistry
Factors affecting boiler water chemistry, 12:15712 (RA;US)
Impact of feedwater chemistry on feedwater heater tubes, 12:15715 (RA;US)
Recommended water chemistry practices for high pressure-drum type boilers, 12:15711 (RA;US)
Steam turbine chemistry - a review, 12:15713 (RA;US)
TUGCO's turbine environment index (Texas Utilities Generating Company), 12:15721 (RA;US)
Water Quality
Babcock & Wilcox Company water chemistry guidelines for once-through steam generators and drum boilers, 12:15710 (RA;US)

Water Treatment
Phosphate and other hide-out, 12:15734 (RA;US)
Steam turbine chemistry - a review, 12:15713 (RA;US)

FEEDWATER HEATERS
Leaks
Leak detection by acoustic emission monitoring in power plant high pressure preheaters, 12:15700 (RA;US)

FELIX FACILITY
Research Programs
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)

FERMENTATION ALCOHOL
See ETHANOL

FERMILAB ACCELERATOR
Facility at Fermi National Accelerator Laboratory, Batavia, Illinois, includes main synchroton, booster synchrotron, and linac.
Buildings
Fermilab Central Computing Facility: Energy conservation report and mechanical systems design optimization and cost analysis study, 12:16550 (R;US)

FERMILAB TEVATRON
Operation
The tevatron energy doubler: A superconducting accelerator, 12:16519 (BA;US)

FERMIONS
See also LEPTONS
Anomalous Dimension
Chiral anomalies and finite-mode regularization of the fermion integral, 12:17168 (R;SU;In Russian)
Axial-Vector Currents
Chiral anomalies and finite-mode regularization of the fermion integral, 12:17168 (R;SU;In Russian)
Chiral Symmetry
Chiral anomalies and finite-mode regularization of the fermion integral, 12:17168 (R;SU;In Russian)
Majorana Theory
On pair production of Majorana particles in collisions of polarized e/sup +/ and e/sup -/, 12:17147 (R;SU;In Russian)
Mass Spectra
Fermion masses in GUTs with intermediate scales, 12:17188 (BA;NL)
Pair Production
On pair production of Majorana particles in collisions of polarized e/sup +/ and e/sup -/, 12:17147 (R;SU;In Russian)

FERRIC COMPOUNDS
See IRON COMPOUNDS

FERRITES
Specific compounds should be indexed by coordination of a descriptor of the form (CATION) COMPOUNDS and the above anion descriptor.
Crystal Defects
Electronic defects in $LiFeO_2$, 12:16190 (R;US)
Electric Conductivity
Electronic defects in $LiFeO_2$, 12:16190 (R;US)
Seebeck Effect
Electronic defects in $LiFeO_2$, 12:16190 (R;US)

FERRITIC STEELS
Brittleness
Incorporating plastic collapse into the linear elastic fracture mechanics methodology in determining crack propagation lifetimes, 12:17574 (J;US)
Corrosion Products
FLiBe-vanadium alloy system corrosion product radiation hazards analysis, 12:17576 (J;US)
Crack Propagation
Incorporating plastic collapse into the linear elastic fracture mechanics methodology in determining crack propagation lifetimes, 12:17574 (J;US)
Fracture Mechanics
Incorporating plastic collapse into the linear elastic fracture mechanics methodology in determining crack propagation lifetimes, 12:17574 (J;US)
Physical Radiation Effects
FLiBe-vanadium alloy system corrosion product radiation hazards analysis, 12:17576 (J;US)

FERROUS COMPOUNDS
See IRON COMPOUNDS

FERTILE MATERIALS
Mathematical Models
A model for the mechanical interaction between solid breeder and cladding materials, 12:17601 (J;US)
Swelling
A model for the mechanical interaction between solid breeder and cladding materials, 12:17601 (J;US)

FFTF REACTOR
Westinghouse Hanford Company, Richland, Washington
Cover Gas
Reactor cover gas monitoring at the Fast Flux Test Facility, 12:15984 (R;US)
Fuel Management
FFTF fuel rotation for extended burnup, 12:15996 (J;US)
Fuel Pins
Remote weighing of irradiated fuel pins at FFTF, 12:15997 (J;US)
Hot Cells
Remote tool development at the interim examination and maintenance (IEM) cell, 12:16001 (J;US)

Loss of Flow
Application of the GEM shutdown device to the FFTF reactor, 12:16079 (J;US)
Reactivity worth of gas expansion modules (GEMs) in the fast flux test facility, 12:15861 (J;US)
Radioactive Waste Facilities
The Solid Waste Transfer Pit an FFTF [Fast Flux Test Facility] station for fuel and reflector transfer, 12:15983 (R;US)
Reactor Kinetics
Reactivity worth of gas expansion modules (GEMs) in the fast flux test facility, 12:15861 (J;US)
Reactor Operation
Reactor cover gas monitoring at the Fast Flux Test Facility, 12:15984 (R;US)
Reactor Safety Experiments
Application of the GEM shutdown device to the FFTF reactor, 12:16079 (J;US)
Reactor Shutdown
Application of the GEM shutdown device to the FFTF reactor, 12:16079 (J;US)

Supersymmetry
Instantons versus SUSY, 12:17165 (R;SU)

FILTERS
See also FABRIC FILTERS
OPTICAL FILTERS
Performance Testing
Hyperfiltration of tomato juice: pilot plant scale high temperature testing, 12:16853 (J;US)
Hyperfiltration of tomato juice during long term high temperature testing, 12:16854 (J;US)

FINANCIAL ASSISTANCE
Nuclear engineering, health physics, and radioactive waste management fellowship program: Summary of program activities: Radioactive waste management fellowship, 1985-1986, 12:15423 (R;US)

FINANCIAL MANAGMENT
See PROGRAM MANAGEMENT

FINLAND
Air Transport
Aviation Regulation OPS M1-18 on the Transport of Dangerous Goods by Air, 12:15576 (R;FI;In Finnish)
Liabilities
Decree bringing into force the Nuclear Liability Act (No. 486/72), 12:16058 (R;FI;In Finnish)
Nuclear Liability Act as amended (No. 484/72), 12:16057 (R;FI)
Maritime Transport
Decision of the National Board of Navigation on the Carriage of Dangerous Goods in Ships, 12:15575 (R;FI)
Non-Proliferation Policy
Ministerial Decision No. 116 on the export of some materials, equipment and devices in the field of Atomic Energy, 12:15574 (R;FI;In Finnish)
Nuclear Power Plants
Factors influencing capital costs of nuclear power plant in Finnish conditions, 12:15888 (RA;XA)
Nuclear Trade
Ministerial Decision No. 116 on the export of some materials, equipment and devices in the field of Atomic Energy, 12:15574 (R;FI;In Finnish)
Radiation Protection
Decision on radiation protection of 5.11.1968/594, 12:15571 (R;FI;In Finnish)
Radiation Protection Laws
Radiation Protection Act 26.4.1957/174, 12:15569 (R;FI;In Finnish)
Radiation Protection Decree 27.9.1957/328, 12:15570 (R;FI;In Finnish)
Radioactive Waste Processing
Council of State decision relating to examinations under Section 5 of the Radiation Protection Act (No. 243/58), 12:15573 (R;FI;In Finnish)
Radiological Personnel
Decree relating to the annual leave of persons working under harmful radiation conditions (No. 175/67), 12:15572 (R;FI;In Finnish)
Road Transport
Transport of dangerous substances by road, 12:15399 (R;FI;In Finnish)
Transport Regulations
Aviation Regulation OPS M1-18 on the Transport of Dangerous Goods by Air, 12:15576 (R;FI;In Finnish)
Decision of the National Board of Navigation on the Carriage of Dangerous Goods in Ships, 12:15575 (R;FI)
Transport of dangerous substances by road, 12:15399 (R;FI;In Finnish)

FINNISH ORGANIZATIONS
International Cooperation
Decree setting up the Atomic Energy Commission, as amended (No. 76/58), 12:17685 (R;FI;In Finnish)
Licensing
Decree relating to the competence of the National Board of Health to issue permits under the Radiation Protection Act, 5.2.1959/47, 12:17684 (R;FI;In Finnish)
Nuclear Energy
Decree setting up the Atomic Energy Commission, as amended (No. 76/58), 12:17685 (R;FI;In Finnish)
Nuclear Industry
Decree setting up the Atomic Energy Commission, as amended (No. 76/58), 12:17685 (R;FI;In Finnish)
Radiation Protection
Decree relating to the competence of the National Board of Health to issue permits under the Radiation Protection Act, 5.2.1959/47, 12:17684 (R;FI;In Finnish)

FIREDAMP
See METHANE

FIRES
Air Pollution
Atmospheric-dispersion index for prescribed burning. Forest Service research paper, 12:16728 (R;US)

FIRST WALL
Composite Materials
First wall tile attachment using carbon-carbon composite fittings, 12:17582 (J;US)
Design
First wall and vacuum vessel analysis for Compact Ignition Tokamaks, 12:17507 (J;US)
First wall structural analysis of the aqueous self-cooled blanket concept, 12:17600 (J;US)
Lithium-cooled blankets for advanced tokamaks, 12:17520 (J;US)
Eddy Currents
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)
Evaporation
Improved understanding of first-wall vaporization-condensation in inertial confinement fusion reactors, 12:17564 (J;US)
Magnetohydrodynamics
Lithium-cooled blankets for advanced tokamaks, 12:17520 (J;US)
Materials Testing
First wall structural analysis of the aqueous self-cooled blanket concept, 12:17600 (J;US)
Incorporating plastic collapse into the linear elastic fracture mechanics methodology in determining crack propagation lifetimes, 12:17574 (J;US)

Mathematical Models
A model for first-wall thermal response to plasma energy deposition, 12:17517 (J;US)
Temperature Gradients
A model for first-wall thermal response to plasma energy deposition, 12:17517 (J;US)
Thermal Analysis
A model for first-wall thermal response to plasma energy deposition, 12:17517 (J;US)
Torque
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)
Vapor Condensation
Improved understanding of first-wall vaporization-condensation in inertial confinement fusion reactors, 12:17564 (J;US)

FISCHER-TROPSCH SYNTHESIS
Catalysts
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Final quarterly technical progress report No. 4 for the period 1 July to 30 September 1986, 12:15284 (R;US)

FISH MEAL
See FISH PRODUCTS

FISH PRODUCTS
Radicidation
Proposal for imported fish meal radicidation, 12:16852 (RA;CS;In Czech)

FISSION PRODUCT RELEASE
Coordinate with descriptors for the area of release such as BIOSPHERE or COOLANTS, and for the specific fission products, if known.
Downstream behavior of fission products, 12:15965 (R;US)
Calculation Methods
Calculations for determining appropriate key radionuclides for failed fuel analysis, 12:15827 (J;US)
Q Codes
QUASAR: a methodology for quantification of uncertainties in severe-accident source terms, 12:16102 (J;US)

FISSION PRODUCTS
Behavior
Downstream behavior of fission products, 12:15965 (R;US)
Correlations
Crystal structure stability and fission gas swelling in intermetallic uranium compounds, 12:16301 (J;NL)
Gamma Spectra
Modeling of Ge(Li) gamma-ray spectra, 12:16126 (J;US)
Reactor Safety Experiments
Part I. Fuel-motion diagnostics in support of fast-reactor safety experiments. Part II. Fission product detection system in support of fast reactor safety experiments, 12:16014 (R;US)
Retention
Fission gas retention and axial expansion of irradiated metallic fuel, 12:15849 (R;US)

FISSION RATIO
Data Covariances
Covariances for measured activation and fission ratios data, 12:17256 (R;US)

FISSION SPECTRA
Spectra Unfolding
Measurement of thermal-neutron-induced /sup 235/U fission spectrum by threshold detectors, 12:17255 (R;CN;In Chinese)
Uranium 235
Measurement of thermal-neutron-induced /sup 235/U fission spectrum by threshold detectors, 12:17255 (R;CN;In Chinese)

FISSIONABLE MATERIALS MANAGEMENT
See NUCLEAR MATERIALS MANAGEMENT

FIXATION (CARBON DIOXIDE)
See CARBON DIOXIDE FIXATION

FLAMES
Quantitative Chemical Analysis
High-resolution coherent anti-Stokes Raman spectroscopy measurements of carbon monoxide linewidths in a flame, 12:15370 (BA;US)
Raman Spectra
High-resolution coherent anti-Stokes Raman spectroscopy measurements of carbon monoxide linewidths in a flame, 12:15370 (BA;US)

FLAVOR MODEL
Configuration Mixing
Heavy flavour decays and the structure of weak interactions, 12:17132 (R;DE)

FLAWS
See DEFECTS

FLIBE
Molten salt of fluorine, lithium, and beryllium.
Chemical Reaction Kinetics
The chemistry of molten Li/sub 2/BeF/sub 4/, 12:17581 (J;US)
Corrosion Products
FLiBe-vanadium alloy system corrosion product radiation hazards analysis, 12:17576 (J;US)
Physical Radiation Effects
FLiBe-vanadium alloy system corrosion product radiation hazards analysis, 12:17576 (J;US)
Reliability
IPFR, Integrated Pool Fusion Reactor Concept, 12:17497 (J;US)
Safety

FLOW (FLUID)
See FLUID FLOW

FLOW MODELS
Hamiltonians
Hamiltonian differencing of fluid dynamics, 12:17093 (J;US)
Vortex Flow
CALTECH: DOE program on numerical analysis, computing and fundamental studies in fluid mechanics: Summary report No. 12, April 1, 1986-March 31, 1987, 12:17087 (R;US)

FLOWMETERS
Comparative Evaluations
Techniques for measurement of velocity in liquid-metal MHD flows, 12:17518 (J;US)
Design
Advanced research in instrumentation and control technology: Capacitance flowmeter, 12:15273 (R;US)
Performance Testing
Advanced research in instrumentation and control technology: Capacitance flowmeter, 12:15273 (R;US)

FLUE GAS
Additives
Flue gas conditioning for improved baghouse performance, 12:15748 (RA;US)

FLUID FLOW
See also GAS FLOW
TURBULENT FLOW
TWO-PHASE FLOW
Computerized Simulation
On the use of CORLIB subroutines for the solution of a model fluid flow problem, 12:17655 (R;US)
F Codes
On the use of CORLIB subroutines for the solution of a model fluid flow problem, 12:17655 (R;US)
Numerical Solution
Super problems for supercomputers, 12:17681 (BA;US)
P Codes
Thermal-hydraulic aspects of flow inversion in a research reactor, 12:15982 (R;US)
Parallel Processing
Super problems for supercomputers, 12:17681 (BA;US)
Test Facilities
Fluidization mechanisms in slurry flows: Quarterly report, 12:16474 (R;US)

FLUID INJECTION
See also GAS INJECTION
STEAM INJECTION
WATERFLOODING
Rock-Fluid Interactions
1985/1986 SOMED [School of Mines and Energy Development] project: The effect of temperature, fluid

composition, and flow rate on sandstones: implications for enhanced oil recovery methods: Final report, 12:15356 (R;US)

FLUIDIZED-BED COMBUSTORS
Demonstration Programs
Comprehensive report to Congress: Clean Coal Technology program: Tidd PFBC [pressurized fluidized-bed combustion] demonstration project, 12:15327 (R;US)
Materials Testing
Low-rank coal research: Quarterly technical progress report for the period April-June 1986, 12:15310 (R;US)

FLUORINE 24
Half-Life
Application of the PFIS method to the LISE spectrometer at GANIL: (Experiment beta performed at the GANIL National Laboratory in Caen (France)) beta decay of light neutron rich exotic nuclei, 12:17217 (R;FR)

FLUORINE COMPOUNDS
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)

FLUX (NEUTRON)
See NEUTRON FLUX

FLY ASH
Air Pollution
Performance of a high-sulfur-coal, pilot-scale fabric filter, 12:15747 (RA;US)
Biological Effects
Response of small laboratory animals to coal fly ash inhalation, 12:15344 (R;JP;In Japanese)
Chemical Properties
Flue gas conditioning for improved baghouse performance, 12:15748 (RA;US)
Deposition
Aerosol deposition in fabric filters, 12:15746 (RA;US)
Distribution of fly ash in a filter bag operating with a charged axial electrode, 12:15738 (RA;US)
Mutagen Screening
On the mutagenicity of fly ash samples from the PGEM power plant 'Gelderland' at Nijmegen, as determined with the Ames test, 12:15319 (R;NL;DU)
Physical Properties
Flue gas conditioning for improved baghouse performance, 12:15748 (RA;US)
Removal
Flue gas conditioning for improved baghouse performance, 12:15748 (RA;US)
Performance of a high-sulfur-coal, pilot-scale fabric filter, 12:15747 (RA;US)
Waste Product Utilization
Physical properties of cultivated soils mixed with coal ash as ameliorant, 12:15309 (R;JP;In Japanese)

FLYWHEEL ENERGY STORAGE
Efficiency
Fast-running permanent-magnet synchronous engine with small idle losses for kinetic energy storage systems, 12:16147 (R;DE;In German)
Optimization
Fast-running permanent-magnet synchronous engine with small idle losses for kinetic energy storage systems, 12:16147 (R;DE;In German)

FLYWHEELS
Design
Fast-running permanent-magnet synchronous engine with small idle losses for kinetic energy storage systems, 12:16147 (R;DE;In German)
Performance Testing
Fast-running permanent-magnet synchronous engine with small idle losses for kinetic energy storage systems, 12:16147 (R;DE;In German)

FOCUSSED LOGGING
See RESISTIVITY LOGGING

FOKKER-PLANCK COEFFICIENTS
See FOKKER-PLANCK EQUATION

FOKKER-PLANCK EQUATION
Numerical Solution
Approximation of Fokker-Planck equation by a deterministic particle method, 12:17399 (R;FR;In French)

FOOD
See also ANIMAL FEEDS
Irradiation
Application of ionizing radiation in food and feeds processing. Proceedings of seminar, 12:16844 (R;CS;In Czech)
Success and future potential of ionizing radiations in solving the food problem in the world, 12:16849 (RA;CS;In Czech)
Radiodisinfestation
Will radiodisinfestation lead to a reduction in pesticide residues in food?, 12:16850 (RA;CS;In Czech)
Radiopreservation
Expanding the possibilities of food and feeds irradiation using UVVVR radiation sources, 12:16851 (RA;CS;In Czech)

FOOD IRRADIATION

Integral fuel burnable absorber experience in two- and three-loop cores, 12:15956 (J;US)
Planning
Examination of fuel reinsertion strategies for out-of core fuel management, 12:15907 (J;US)

FUEL MOTION DETECTION
Reactor Safety Experiments
Part I. Fuel-motion diagnostics in support of fast-reactor safety experiments. Part II. Fission product detection system in support of fast reactor safety experiments, 12:16014 (R;US)

FUEL PELLETS
Corrosion Resistance
In-pile and out-of-pile corrosion behavior of thoria-urania pellets (LWBR [Light Water Breeder Reactor] Development program), 12:15857 (R;US)

FUEL PENCILS
See FUEL PINS

FUEL PINS
Fission Products
Fission gas retention and axial expansion of irradiated metallic fuel, 12:15849 (R;US)
Performance
Performance of liquid metal reactor fuel pins with D9 cladding, 12:15853 (R;US)
SIEX3: A correlated computer code for prediction of fast reactor mixed oxide fuel and blanket pin performance, 12:15854 (R;US)
S Codes
SIEX3: A correlated computer code for prediction of fast reactor mixed oxide fuel and blanket pin performance, 12:15854 (R;US)
Thermal Expansion
Fission gas retention and axial expansion of irradiated metallic fuel, 12:15849 (R;US)
Weight Indicators
Remote weighing of irradiated fuel pins at FFTF, 12:15997 (J;US)

FUEL RACKS
Seismic Effects
Seismic behavior of spent-fuel racks supported by aseismic bearing devices, 12:15403 (J;US)

FUEL REPROCESSING
See REPROCESSING

FUEL REPROCESSING PLANTS
See also IDAHO CHEMICAL PROCESSING PLANT
WEST VALLEY PROCESSING PLANT
Hot canyon crane operating problems and equipment failures: F-Canyon Reprocessing Facility, Savannah River Plant, 12:15386 (R;US)
Construction Permits
Preliminary statement concerning the expert opinion and other documents relating to the Wackersdorf fuel reprocessing plant, laid open between June 18 and July 15, 1985 by the Bavarian Ministry of State for Regional Development and Environmental Affairs, 12:15388 (R;DE;In German)
Doors
Close-fitting shield doors with sculptured edges, 12:15391 (J;US)
Fuel Assembly Dismantling
German bundle shear - cold test results, 12:15390 (J;US)
Licensing
Preliminary statement concerning the expert opinion and other documents relating to the Wackersdorf fuel reprocessing plant, laid open between June 18 and July 15, 1985 by the Bavarian Ministry of State for Regional Development and Environmental Affairs, 12:15388 (R;DE;In German)
Modifications
CEA R and D contribution to the La Hague extension plant (fuel reprocessing), 12:15379 (R;FR)
Marcoule pilot plant (Nuclear fuel reprocessing), 12:15380 (R;FR)
Public Relations
Preliminary statement concerning the expert opinion and other documents relating to the Wackersdorf fuel reprocessing plant, laid open between June 18 and July 15, 1985 by the Bavarian Ministry of State for Regional Development and Environmental Affairs, 12:15388 (R;DE;In German)
Radiation Protection
Close-fitting shield doors with sculptured edges, 12:15391 (J;US)
Remote Handling Equipment
Aspects of remote maintenance in an FRG reprocessing plant from the manufacturer's viewpoint, 12:15396 (J;US)
Design and testing of remote handling systems for reprocessing plant maintenance and for nuclear reactor dismantling, 12:15394 (J;US)
Remote maintenance in the TOR fast reactor fuel reprocessing facility, 12:15395 (J;US)

FUEL ROD CONSOLIDATION
See FUEL RODS

FUEL RODS
Burnup
ARMP-02 documentation: Part 2, Chapter 7, MICBURN-E computer code manual: Volume 1, Theory and numerics manual, 12:15774 (R;US)
Computerized Simulation
Effect of axial diffusional delays on the overall fission gas release, 12:15972 (BA;US)
Prediction of the UO/sub 2/ fission gas release data of Bellamy and Rich using a model recently developed by Combustion Engineering, 12:15971 (BA;US)
Fission Product Release
Effect of axial diffusional delays on the overall fission gas release, 12:15972 (BA;US)
Prediction of the UO/sub 2/ fission gas release data of Bellamy and Rich using a model recently developed by Combustion Engineering, 12:15971 (BA;US)
Release of tellurium and caesium from UO/sub 2/ in LWR fuel rods during irradiation, 12:15970 (BA;US)
P Codes
Development of a PCMI analysis code for the Fugen MOX fuel rod, 12:15845 (BA;US)
Performance
Research of LWR [light water reactor] fuel rod behaviour under accident conditions, 12:16033 (R;XA)
Rewetting
Quenching rates in 7-rod bundle of zirconium alloy at emergency cooling parameters of WWER, 12:16032 (R;SU;In Russian)
S Codes
SSYST: A code-system for analyzing transient LWR fuel rod behaviour under off-normal conditions, 12:16145 (BA;US)
Thermal Diffusion
Effect of axial diffusional delays on the overall fission gas release, 12:15972 (BA;US)

FUEL SHEATHS
See FUEL CANS

FUEL SLUGS
See FUEL RODS

FUEL SLURRIES
Acoustic Measurements
Advanced research in instrumentation and control technology: Acoustic parameter studies, 12:16599 (R;US)
Atomization
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
Chemical Preparation
Low-rank coal research: Quarterly technical progress report for the period April-June 1986, 12:15310 (R;US)

Combustion Kinetics
A comparison of the evolution of particle size distributions during combustion for coal and coal/water slurries, 12:15333 (BA;US)
Quantitative Chemical Analysis
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)

FUEL SUSPENSIONS
See FUEL SLURRIES

FUELS
See also AUTOMOTIVE FUELS
FOSSIL FUELS
FUEL SLURRIES
LIQUID FUELS
NUCLEAR FUELS
REFUSE DERIVED FUELS
SOLID FUELS
SYNTHETIC FUELS
THERMONUCLEAR FUELS
Combustion Products
Conditional sampling for fuel and soot in CARS thermometry, 12:16434 (BA;US)
Raman Spectra
Conditional sampling for fuel and soot in CARS thermometry, 12:16434 (BA;US)

FUELS (NUCLEAR)
See NUCLEAR FUELS

FULLERS EARTH
Sorptive Properties
Study of high temperature removal of alkali of a pressurized gasification system: Final report (Emathlite pellets), 12:15276 (R;US)

FUMES
See AEROSOLS

FUNDAMENTAL PARTICLES
See ELEMENTARY PARTICLES

FURNACES
See also BLAST FURNACES
Energy Demand
Energy optimisation of industrial furnaces by optimum control, 12:16500 (R;DE;In German)
Optimization
Energy optimisation of industrial furnaces by optimum control, 12:16500 (R;DE;In German)

FUSED SALTS

FUSION ELECTROMAGNETIC INDUCTION EXPERIME
See FELIX FACILITY

FUSION ENERGY
See THERMONUCLEAR REACTORS

FUSION FUELS
See THERMONUCLEAR FUELS

FUSION (NUCLEAR)
See THERMONUCLEAR REACTIONS

FUSION REACTIONS
See HEAVY ION FUSION REACTIONS

FUSION REACTORS
See THERMONUCLEAR REACTORS

G

G CODES
Upgrade of the GRESS (test version D) precompiler to allow triply-dimensioned arrays, 12:17654 (R;US)

GADOLINIUM
Activation Analysis
Analysis of rare earths and cadmium in reference materials: Li_2SO_4 and $MnSO_4$, 12:16386 (R;FR)

GADOLINIUM 163
Cross Sections
Nuclear data for gadolinium production, 12:15578 (J;US)
Nuclear Data Collections
Nuclear data for gadolinium production, 12:15578 (J;US)
Production
Nuclear data for gadolinium production, 12:15578 (J;US)

GADOLINIUM OXIDES
Solid Solutions
O/M ratio measurements of $(U,Gd)O_2$ solid solutions by gravimetry, 12:15814 (J;US)

GALAXIES
Cosmological Models
Two states of CYG X-1 and related sources, 12:17038 (R;US)
Emission Spectra
Continuum radiation from active galactic nuclei: a statistical study, 12:17039 (R;US)
Neutrinos
Neutrino masses and galaxy formation, 12:16953 (RA;CS)
Star Evolution
Early galactic evolution and the nature of the first stars, 12:17049 (R;DK)

GALAXY CLUSTERS
Correlation Functions
Correlation functions for the clustering of galaxies and Abell clusters, 12:17045 (R;DK)

GALAXY NUCLEI
Central part of galaxies.
Polarization
Frequency dependent polarization in blazars, 12:17043 (R;DK)

GALLIUM
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)

GALLIUM 71 TARGET
Neutrino Reactions
Solar neutrino experiments, 12:17106 (RA;CS)

GALLIUM ARSENIDES
Electronic Structure
The surface electronic structure of GaAs(100) and GaAs(111) from angle resolved photoemission, 12:16373 (BA;US)
Molecular Beam Epitaxy
Superlattice structures grown by molecular beam epitaxy, 12:16371 (BA;US)
Photoemission
The surface electronic structure of GaAs(100) and GaAs(111) from angle resolved photoemission, 12:16373 (BA;US)
Superlattices
Superlattice structures grown by molecular beam epitaxy, 12:16371 (BA;US)
Surface Properties
The surface electronic structure of GaAs(100) and GaAs(111) from angle resolved photoemission, 12:16373 (BA;US)

GAMMA DETECTION
Coincidence Methods
Method of processing data and evaluating uncertainty in $4\pi\beta$-γ coincidence measurement, 12:16597 (R;CN;In Chinese)

GAMMA HEATING
See RADIATION HEATING

GAMMA LOGGING
Well Logging Equipment
Low radioactivity spectral gamma calibration facility, 12:15347 (BA;US)

GAMMA RADIATION
See also PROMPT GAMMA RADIATION
Radiation Transport
SKYSHIN: A computer code for calculating radiation dose over a barrier, 12:17330 (R;US)

GAMMA REACTIONS
See PHOTONUCLEAR REACTIONS

GAMMA SOURCES
For cosmic sources of gamma radiation use COSMIC GAMMA SOURCES.
Construction
Multipurpose prompt gamma facility, 12:15581 (J;US)
Design
Multipurpose prompt gamma facility, 12:15581 (J;US)

GAMMA SPECTRA
S Codes
Modeling of Ge(Li) gamma-ray spectra, 12:16126 (J;US)

GAMMA SPECTROMETERS
Natural Radioactivity
Radioactive contaminations of materials for low-background setups, 12:16643 (R;SU;In Russian)
On-Line Measurement Systems
Automation correlation installation on-line with a computer, 12:16642 (R;SU;In Russian)
Subsurface Structures
Investigation of backgrounds of scintillation and semiconductor detectors in the underground lowbackground laboratory of the Institute for Nuclear Research, the Ukrainian Academy of Sciences, 12:16644 (R;SU;In Russian)
GAMMA-RAY LASERS
See GASERS
GANIL
See GANIL CYCLOTRON
GANIL CYCLOTRON
Grand Accelerateur National 'a Ions Lourdes, a heavy ion accelerator consisting of two identical isochronous cyclotrons and a particle booster for injection, located in Orsay, France.
Irradiation Devices
Interaction of GeV heavy ions with solids-first results at GANIL, 12:16536 (R;FR)
GARNETS
For silicate garnets only.
Photoconductivity
Ground and excited state photoconductivity measurements of Ce^{3+}:YAG, 12:16352 (R;US)
GAS COOLANTS
See GASES
GAS ENGINES
See INTERNAL COMBUSTION ENGINES
GAS FLOW
Equations of Motion
On the Maxwellian distribution, symmetric form, and entropy conservation for the Euler equations, 12:16476 (R;US)
GAS INJECTION
Bench-Scale Experiments
Experimental study of waterflooding from a 2-D layered sand model, 12:15354 (RA;US)
Sweep Efficiency
Experimental study of waterflooding from a 2-D layered sand model, 12:15354 (RA;US)
GAS LASERS
See also CARBON DIOXIDE LASERS
Nuclear Pumping
Nuclear reactor excitation of XeF laser gas mixtures, 12:16467 (R;US)
GAS TURBINE ENGINES
Turbine Blades
Slow crack growth in sintered silicon nitride, 12:16339 (BA;US)
GAS TURBINE POWER PLANTS
Materials
Materials for large land-based gas turbines. Final report, 1984-1986, 12:15737 (R;US)
GAS YIELDS
Expansion of high-temperature; high-pressure data set for coal gasification: Sixth quarterly report, December 28, 1985-March 28, 1986, 12:15280 (R;US)
GASERS
Gamma-ray Amplification by Stimulated Emission of Radiation.
Photonuclear Reactions
Nuclear interlevel transfer driven by collective outer shell electron oscillations, 12:17351 (R;US)
GASES
See also AIR
EXHAUST GASES
FUEL GAS
RARE GASES
SYNTHESIS GAS
VOLCANIC GASES
Diffusion
Micropore diffusion in coal chars under reactive conditions: Quarterly technical progress report, 15 September 1986-15 December 1986, 12:15287 (R;US)
Ion Collisions
Ionization and charge transfer in high-energy ion-atom collisions, 12:17081 (R;US)
GASOLINE ENGINES
See INTERNAL COMBUSTION ENGINES
GE SEMICONDUCTOR DETECTORS
See also HIGH-PURITY GE DETECTORS
LI-DRIFTED GE DETECTORS
Performance
Using a HPGe detector and micro R meter for quick and simple estimate of radionuclide activity in LSA shipping containers, 12:15531 (RA;US)
GE(LD) DETECTORS
See LI-DRIFTED GE DETECTORS
GENERAL CIRCULATION MODELS
Sensitivity
General circulation model CO_2 sensitivity experiments: snow-sea ice albedo parameterizations and globally averaged surface air temperature, 12:16738 (J;NL)
Validation
January and July simulations with a spectral general circulation model, 12:16699 (J;US)
GENERAL RELATIVITY THEORY
See also RELATIVITY THEORY
Einstein's Prague ideas on gravitation: the history and the present, 12:17363 (RA;CS)
Asymptotic Solutions
Asymptotic behaviour of Robinson-Trautman pure radiation solutions, 12:17385 (R;HU)
Kerr Metric
On the types of unbounded orbits in Kerr metric, 12:17365 (R;SU;In Russian)
GENERATORS (ELECTRIC)
See ELECTRIC GENERATORS
GENERATORS (PULSE)
See PULSE GENERATORS
GENERATORS (STEAM)
See STEAM GENERATORS
GENTILLY REACTOR
Nicolet, Quebec, Canada
Decommissioning
Establishing a comprehensive cost-effective radiological protection program for decommissioning project, 12:16009 (RA;US)
Personnel Monitoring
Evaluation of use of the NNC Gamma-12 portal monitor for internal dosimetry screening during decommissioning, 12:16012 (RA;US)
GEOLOGIC DEPOSITS
See also NATURAL GAS DEPOSITS
OIL SAND DEPOSITS
PETROLEUM DEPOSITS
SALT DEPOSITS
Radioactive Waste Disposal
Technical review of US Department of Energy draft area recommendation report for the crystalline repository project, 12:15421 (R;US)
GEOLOGIC FRACTURES
Fluid Flow
Coupled processes in single fractures, double fractures and fractured porous media, 12:16919 (R;US)
Radionuclide Migration
Coupled processes in single fractures, double fractures and fractured porous media, 12:16919 (R;US)
GEOMAGNETIC STORMS
See MAGNETIC STORMS
GEORGIA
Coastal Waters
Sediment transport characteristics of the nearshore zone between Hilton Head and Ossabaw Islands, Georgia as determined by heavy mineral analysis, 12:16934 (R;US)
GEOTHERMAL RESOURCES
Resource Assessment
Further investigations of the UK heat flow field (1981-1984). Investigation of the geothermal potential of the UK, 12:15628 (R;GB)
GEOTHERMAL SPRINGS
See THERMAL SPRINGS
GEOTHERMAL SYSTEMS
See also HOT-DRY-ROCK SYSTEMS

MAGMA SYSTEMS
Geology
Geologic and hydrologic research on the Moana geothermal system, Washoe County, Nevada, 12:15627 (J;US)
Hydrology
Geologic and hydrologic research on the Moana geothermal system, Washoe County, Nevada, 12:15627 (J;US)

GERMAN FEDERAL REPUBLIC
See FEDERAL REPUBLIC OF GERMANY

GERMANIUM
Grain Boundaries
Ab-initio determination of the structure of a grain boundary by simulated quenching, 12:16354 (R;US)
Theoretical investigation of twist boundaries in germanium, 12:16266 (R;US)
Ion Beam Injection
Surface modification of solids, 12:16317 (BA;US)
Laser Beam Machining
Surface modification of solids, 12:16317 (BA;US)
Physical Radiation Effects
Time-resolved x-ray studies during pulsed-laser irradiation of Ge, 12:16306 (J;US)
Sorptive Properties
Adsorption of Ag on Ge(100)-(2 x 1), 12:16315 (J;GB)
Surface Treatments
Surface modification of solids, 12:16317 (BA;US)

GERMANIUM 68
Adsorption
Studies of the chemical behavior of carrier-free /sup 68/Ge. Pt. 3. Adsorptive properties, 12:16432 (J;DE)

GERMANIUM 76
Double Beta Decay
Results of underground experiment of neutrinoless double beta-decay of /sup 76/Ge, 12:17226 (R;SU;In Russian)
Half-Life
Results of underground experiment of neutrinoless double beta-decay of /sup 76/Ge, 12:17226 (R;SU;In Russian)

GERMANIUM COMPOUNDS
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)

GERMANIUM DETECTORS
See GE SEMICONDUCTOR DETECTORS

GERMANY (FEDERAL REPUBLIC)
See FEDERAL REPUBLIC OF GERMANY

GES FUER REAKTORSICHERHEIT
A section of the Technical Inspection Associations of the German Federal Republic
Research Programs
GRS annual report 1985, 12:17635 (R;DE;In German)

GIANT RESONANCE
Collective Excitations
Closer of the chain of kinetic equation moments and description of the negative-parity collective excitations, 12:17295 (R;SU;In Russian)
Quadrupole Moments
Isoscalar quadratic energy weighted sum rules and quadrupole moment of giant quadrupole resonance, 12:17285 (R;JP)
Random Phase Approximation
Random phase approximation, 12:17286 (R;FR)

GIANT RESONANCE MODEL
Isospin
Isospin mixing during the decay of the Giant Dipole Resonance, 12:17274 (RA;CS)

GIANT STARS
Absorption Spectra
Chromospheric activity of cool giant stars. Final report, 12:17030 (R;US)

GLACIERS
Age Estimation
Structure and timing of the last deglaciation: oxygen-isotope evidence, 12:16922 (J;GB)
Melting
Structure and timing of the last deglaciation: oxygen-isotope evidence, 12:16922 (J;GB)

GLASS
See also BOROSILICATE GLASS
Erosion
Erosion damage in glass and alumina, 12:16330 (R;US)
Fracture Properties
Effect of surface corrosion on glass fracture, 12:16365 (BA;US)
Leaching
Waste glass leaching: Chemistry and kinetics, 12:15448 (R;US)
Stress Corrosion
Effect of surface corrosion on glass fracture, 12:16365 (BA;US)

GLASS INDUSTRY
Electric Power
The role of electricity in glass making, 12:16217 (R;US)

GLASS MELTERS
See CERAMIC MELTERS

GLASSY METALS
See METALLIC GLASSES

GLOVEBOXES
Computer-Aided Design
Computer-aided design of glove boxes and enclosures, 12:16447 (J;US)
Decontamination
Use of urethane foam in the decontamination and decommissioning of nuclear facilities, 12:15519 (RA;US)
Welded Joints
Evaluation of glovebox sectioning using weld splitting techniques, 12:16458 (J;US)

GLUEBALLS
Particle Production
Experiment to study the gluon interactions and glueball production in the central region of hadron collisions at UNK energies (2-3 TEV), 12:17103 (R;SU)

GLUONIUM
See GLUEBALLS

GLUONS
Jet Model
Properties of gluon jets, 12:17095 (R;US)
Structure Functions
QCD and hard quark and gluon scattering, 12:17138 (RA;CS)
Vacuum States
Approach to calculation of the infrared region contribution to vacuum expectation values of gluonic and quark fields, 12:17163 (R;SU)

GLYCOSYL HYDROLASES
Code number 3.2.
Enzyme Activity
Levels of uracil DNA glycosylase and AP endonuclease in murine B- and T-lymphocytes do not change with age, 12:16798 (J;CH)

GOATS
Lethal Radiation Dose
Animal mortality resulting from uniform exposures to photon radiations: Calculated LD_{50}s and a compilation of experimental data, 12:16859 (R;US)

GOBAR GAS
See METHANE

GOLD
Diffusion
Diffusion and ion mixing in amorphous alloys, 12:16249 (R;US)
Grain Boundaries
Lattice imaging study of grain boundaries at normal incidence to the boundary plane, 12:16267 (R;US)
Ion Beam Injection
Surface modification of solids, 12:16317 (BA;US)
Laser Beam Machining
Surface modification of solids, 12:16317 (BA;US)
Superlattices
Elastic properties of superlattices (Nb/Cu; Au/Cr; Mo/Ni), 12:16260 (R;US)
Surface Coating
Magnetic properties of novel epitaxial films, 12:16254 (R;US)

Surface Properties
Modification of the properties of metal overlayers on Nb(110) and Ta(110), 12:16241 (R;US)
Surface Treatments
Surface modification of solids, 12:16317 (BA;US)
GOLD 197 TARGET
Argon 40 Reactions
Multiplicity dependent light particle correlations in $^{40}Ar + ^{197}Au$ reaction at E/A = 60 MeV^0, 12:17236 (R;FR)
Study of cluster emission by excited compound nuclei, 12:17293 (R;SU;In Russian)
Two-particle correlations in $^{40}Ar + ^{197}Au$ at 60 MeV/A, 12:17234 (R;FR)
Carbon 12 Reactions
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)
GOLD IODIDES
Crystal Lattices
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ ($X^- = IBr_2^-$, AuI_2^-, I_3^-), 12:16412 (J;US)
Electron-Phonon Coupling
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ ($X^- = IBr_2^-$, AuI_2^-, I_3^-), 12:16412 (J;US)
Transition Temperature
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ ($X^- = IBr_2^-$, AuI_2^-, I_3^-), 12:16412 (J;US)
GOLD IONS
Energy-Level Transitions
Ionization model for nickel-like gold, 12:16464 (R;FR)
Population model for nickel-like gold which transitions to discard, 12:17060 (R;FR)
Population Inversion
Population model for nickel-like gold which transitions to discard, 12:17060 (R;FR)
GOLD ISOTOPES
Argon 40 Reactions
Search for impact parameter dependence of two-particle correlations using exclusive observables in nucleus-nucleus collisions at intermediate energies, 12:17219 (R;FR)
Rotational States
High-spin states and coexisting states in the Pt-Au transition region, 12:17235 (R;US)
GOLDHABER-TELLER MODEL
See GIANT RESONANCE MODEL
GRADED BAND GAP SOLAR CELLS
See CASCADE SOLAR CELLS
GRAIN ALCOHOL
See ETHANOL
GRAIN BOUNDARIES
Computerized Simulation
Computer simulation of "special" grain boundaries in metals and ionic materials, 12:16247 (R;US)
Oxidation
Grain boundary oxidation and fatigue crack growth at elevated temperatures. Final report, 12:16287 (R;US)
GRAND GULF-1 REACTOR
Port Gibson, Mississippi, USA
Reactor Core Disruption
Evolution of PRA methodology and insights since WASH-1400, 12:16085 (J;US)
Summary of core damage frequency from internal initiators: Grand Gulf, 12:16084 (J;US)
Risk Assessment
Evolution of PRA methodology and insights since WASH-1400, 12:16085 (J;US)
Smart approach to level-1 probabilistic risk assessment, 12:16080 (J;US)
Summary of core damage frequency from internal initiators: Grand Gulf, 12:16084 (J;US)
GRAND UNIFIED THEORY
Cosmology
Astrophysics and grand- and superunification, 12:16954 (RA;CS)
CP Invariance
Problems of CP-violation in early unification theories, 12:17162 (R;SU)
Fermions
Fermion masses in GUTs with intermediate scales, 12:17188 (BA;NL)
P Invariance
Problems of CP-violation in early unification theories, 12:17162 (R;SU)
Particle Multiplets
Problem of families, 12:17187 (BA;NL)
Supersymmetry
Towards a theory of fermion masses: A two-loop finite ν=1global SUSY GUT, 12:17395 (BA;US)
Symmetry Breaking
Problems of CP-violation in early unification theories, 12:17162 (R;SU)
GRANITES
Activation Analysis
Application of different methods of neutron activation analysis to the determination of trace elements in rock samples, 12:16391 (R;DE)
GRAPHITE
Atom Collisions
Simulation studies for surfaces and materials strength. Semiannual report, 1 May-31 October 1986, 12:16290 (R;US)
Evaporation
Formation of long carbon chain molecules during laser vaporization of graphite, 12:16424 (J;US)
Phase Studies
Formation of long carbon chain molecules during laser vaporization of graphite, 12:16424 (J;US)
Physical Radiation Effects
First wall tile attachment using carbon-carbon composite fittings, 12:17582 (J;US)
Sorptive Properties
Heat capacities of rare gases adsorbed on graphite. Technical report, 12:16345 (R;US)
GRAPHITE FIBERS
See CARBON FIBERS
GRAPHITE MODERATOR
See GRAPHITE
GRASERS
See GASERS
GRAVIMELT PROCESS
Bench-Scale Experiments
Bench scale development of the TRW process for cleaning coal (gravimelt process): Quarterly technical progress report for the period February 1985-April 1985, 12:15282 (R;US)
Chemical Reactors
Bench scale development of the TRW process for cleaning coal (gravimelt process): Quarterly technical progress report for the period February 1985-April 1985, 12:15282 (R;US)
Reagents
Bench scale development of the TRW process for cleaning coal (gravimelt process): Quarterly technical progress report for the period February 1985-April 1985, 12:15282 (R;US)
GRAVITATION
Baryon Number
Comment to the reanalysis of the Eoetvoes experiment, 12:17382 (R;HU)
Field Equations
Gravitation and vacuum field, 12:17359 (R;SU;In Russian)
GRAVITATIONAL COLLAPSE
Minkowski Space
Gravitational collapse in relativistic theory of gravitation, 12:17362 (R;SU;In Russian)

GRAVITATIONAL WAVE DETECTORS
Design
Parametric transformation of weak gravitational wave into electromagnetic one in a three-level system, 12:16959 (RA;SU;In Russian)
GRAVITATIONAL WAVES
Parametric transformation of weak gravitational wave into electromagnetic one in a three-level system, 12:16959 (RA;SU;In Russian)
Topology
Gravitational waves with topological charge, 12:17377 (RA;SU;In Russian)
Wave Equations

Remote viewing of melter interior: defense waste processing facility, 12:15483 (J;US)
Stainless steel decontamination manipulators, 12:15479 (J;US)
Radioactive Waste Storage
Cumulative releases of radionuclides from uncontained waste packages, 12:15475 (J;US)
Prediction of temperatures in underground storage facilities for heat-generating materials at the Idaho Chemical Processing Plant, 12:15472 (J;US)
Radionuclide transport through penetrations in nuclear waste containers, 12:15474 (J;US)
Underground Disposal
Report of the symposium on 'total research on long life radioactive waste management' in the Research Center for Nuclear Science and Technology, Univ. of Tokyo, 12:15452 (R;JP;In Japanese)
Uranium Nitrates
Operation of a radiochemical uranium nitrate solidification facility, 12:15485 (J;US)
Vitrification
Solubility tests on borosilicate glasses for West Valley waste immobilization, 12:15473 (J;US)
Volume
Process facility modifications project, 12:15393 (J;US)

HIGH-PURITY GE DETECTORS
Electric Fields
Electric field distribution and impurity concentration in coaxial high purity HP-Ge- and Ge(Li)-detectors with one-open face, 12:16645 (R;SU;In Russian)
Time Resolution
Time planar HPGe detectors, 12:16632 (R;SU;In Russian)

HIGH-TEMPERATURE FUEL CELLS
See also MOLTEN CARBONATE FUEL CELLS
Materials Testing
Materials for high-temperature fuel cells, 12:16197 (BA;US)

HIGH-VOLTAGE PULSE GENERATORS
Pulse voltage generator for electron cannon supply, 12:16560 (R;SU;In Russian)
Reliability
Reliability of high-voltage electron accelerators, 12:16514 (R;SU;In Russian)

HILACS
Cost Estimation
A comparison of the design and costs of induction LINAC drivers for inertial fusion using ions of mass 133 and 200, 12:17616 (J;US)
Design
A comparison of the design and costs of induction LINAC drivers for inertial fusion using ions of mass 133 and 200, 12:17616 (J;US)

HIPPOCAMPUS
Autoradiography
Studies of aluminum in rat brain, 12:16884 (R;US)

HORIZONTAL AXIS TURBINES
Cost
Price targets for wind turbines in utility applications, 12:15663 (BA;US)
Design
Development of the load spectrum for the Westinghouse WWG-0600 wind turbine, 12:15661 (BA;US)
Price targets for wind turbines in utility applications, 12:15663 (BA;US)
Electric Generators
Development of a maintenance free 10 KW windgenerator, 12:15664 (BA;US)
Fabrication
Development of a maintenance free 10 KW windgenerator, 12:15664 (BA;US)
Maintenance
Development of a maintenance free 10 KW windgenerator, 12:15664 (BA;US)
Performance Testing
Development of the load spectrum for the Westinghouse WWG-0600 wind turbine, 12:15661 (BA;US)
Wind Loads
Development of the load spectrum for the Westinghouse WWG-0600 wind turbine, 12:15661 (BA;US)

HOSPITALS
Energy Conservation
ICP [Institutional Conservation Program] monitoring: Final report, 12:16201 (R;US)
Monitoring
ICP [Institutional Conservation Program] monitoring: Final report, 12:16201 (R;US)

HOT CELLS
Performance
Posting in/out technique in KfK hot cells, 12:16461 (J;US)
Update on active facilities at Harwell, UK, 12:16460 (J;US)
Radiation Protection
Posting in/out technique in KfK hot cells, 12:16461 (J;US)
Remote Handling Equipment
Remote tool development at the interim examination and maintenance (IEM) cell, 12:16001 (J;US)
Remote Viewing Equipment
Remote lighting systems for the defense waste processing facility, 12:15481 (J;US)

HOT-DRY-ROCK SYSTEMS
Rock-Fluid Interactions
Experimental investigations of the reaction between albite and acid hydrothermal solutions, 12:15629 (R;DE;In German)

HOUSEHOLDS
Energy Conservation
Energy conservation, 12:16165 (RA;DE;In German)
Energy Consumption
Determination of household energy using 'fingerprints' from energy billing data, 12:16207 (J;GB)
Energy Demand
REEPS [Residual End-Use Energy Planning] code: User's guide (Residential End-Use Energy Planning System), 12:16181 (R;US)

Design
Development of an in-situ hydrogen measuring instrument for coal liquefaction processes: Quarterly report, October-December 1986, 12:15285 (R;US)
Installation
Development of an in-situ hydrogen measuring instrument for coal liquefaction processes: Quarterly report, October-December 1986, 12:15285 (R;US)
Pressure Dependence
Development of an in-situ hydrogen measuring instrument for coal liquefaction processes: Quarterly report, October-December 1986, 12:15285 (R;US)
Temperature Dependence
Development of an in-situ hydrogen measuring instrument for coal liquefaction processes: Quarterly report, October-December 1986, 12:15285 (R;US)
HYDROGEN MINUS 1 BEAMS
See HYDROGEN 1 MINUS BEAMS
HYDROGEN NITRATES
See NITRIC ACID
HYDROGEN PRODUCTION
Coal Gasification
Catalyzed steam gasification of low-rank coals to produce hydrogen, 12:15583 (J;US)
HYDROGEN SULFIDES
Absorption
CNG acid gas removal process: Technical progress report No. 5, 1 October-31 December 1984, 12:15277 (R;US)
HYDROGENATION
Reaction Intermediates
Chemical trapping of CO/H_2 surface species: Quarterly report, 12:15286 (R;US)
Tracer Techniques
Investigation of coal hydrogenation using deuterium as an isotopic tracer, 12:15308 (BA;US)
HYDROLOGY
H Codes
Evaluation and status report on HYDROCOIN at midway (HYDROCOIN: An international project for studying groundwater hydrology modelling strategies), 12:16920 (R;US)
HYDROXYBENZENE
See PHENOL
HYDROXYL IONS
See ANIONS
HYDROXYL RADICALS
Hydroxyl-radical rate-constant intercomparison study. Final report, 12:16718 (R;US)
HYPERFRAGMENTS
See HYPERNUCLEI
HYPERNUCLEI
Sigma Particles
SIGMA hypernuclei: A theoretical review, 12:17299 (R;CA)
HYPERTENSION
Therapy
Some factors affecting the uptake of iodoamphetamine (IAMP), 12:16824 (J;US)
HYPOIODOUS ACID
Volatility
Experimental determination of the partition coefficient of HOI, 12:16104 (J;US)

I

I-BEAM TYPE REACTORS
See ION BEAM FUSION REACTORS
IBR-2 REACTOR
Reactor Noise
Investigation of pattern recognition algorithm to classify the IBR-2 reactor noise spectra, 12:15995 (R;SU;In Russian)
Reactor Stability
Stability of a periodically pulsed reactor, 12:15960 (R;SU;In Russian)
Transfer Functions
Transfer function of a periodically pulsed reactor, 12:15959 (R;SU;In Russian)
ICE
Chemical Composition
Review of the history of atmospheric CO_2 recorded in ice cores, 12:16746 (BA;US)
Isotope Dating
Ice ages, 12:16917 (RA;CS)
Trends in physics 1984. Proceedings of the 6th general conference of the European Physical Society. Volume 2, 12:17140 (R;CS)
ICF DEVICES
Accelerators
The Compact Torus Accelerator: A driver for ICF, 12:17560 (J;US)
Breakdown
Initiation of long electrical discharges in dense ICF reactor atmospheres, 12:17561 (J;US)
Breeding Blankets
Geometrical, spectral and temporal differences between ICF and MCF reactors and their impact on blanket nuclear parameters, 12:17597 (J;US)
Liquid momentum removal using rod arrays applied to the HYLIFE ICF reactor, 12:17568 (J;US)
Compact Torus
ICF drivers: A comparison of some new entries and old standbys, 12:17556 (J;US)
The Compact Torus Accelerator: A driver for ICF, 12:17560 (J;US)
Cost Estimation
A standard method for economic analyses of inertial confinement fusion power plants, 12:17590 (J;US)
SAFIRE - A systems analysis code for inertial fusion economics, 12:17591 (J;US)
Design
Geometrical, spectral and temporal differences between ICF and MCF reactors and their impact on blanket nuclear parameters, 12:17597 (J;US)
Ion beam trapping in plasma channels for light ion inertial confinement fusion, 12:17557 (J;US)
Direct Energy Conversion
Turbostar: An ICF reactor using both direct and thermal power conversion, 12:17562 (J;US)
Economic Analysis
A standard method for economic analyses of inertial confinement fusion power plants, 12:17590 (J;US)
Electric Discharges
Initiation of long electrical discharges in dense ICF reactor atmospheres, 12:17561 (J;US)
First Wall
Improved understanding of first-wall vaporization-condensation in inertial confinement fusion reactors, 12:17564 (J;US)
Free Electron Lasers
ICF drivers: A comparison of some new entries and old standbys, 12:17556 (J;US)
Heavy Ion Accelerators
ICF drivers: A comparison of some new entries and old standbys, 12:17556 (J;US)
Ion Beams
ICF drivers: A comparison of some new entries and old standbys, 12:17556 (J;US)

Ion beam trapping in plasma channels for light ion inertial confinement fusion, 12:17557 (J;US)
Krypton Fluoride Lasers
Conceptual design of a large E-beam-pumped KrF laser for ICF commercial applications, 12:17558 (J;US)
Conceptual design of a hybrid KrF laser system for ICF commercial applications, 12:17559 (J;US)
ICF drivers: A comparison of some new entries and old standbys, 12:17556 (J;US)
Performance
SAFIRE - A systems analysis code for inertial fusion economics, 12:17591 (J;US)
Rankine Cycle
Turbostar: An ICF reactor using both direct and thermal power conversion, 12:17562 (J;US)
S Codes
SAFIRE - A systems analysis code for inertial fusion economics, 12:17591 (J;US)
Solid State Lasers
ICF drivers: A comparison of some new entries and old standbys, 12:17556 (J;US)

ICR HEATING
Magnetoacoustic Waves
Simulation of ion cyclotron resonance heating through resonant absorption in two-ion species plasma, 12:17401 (R;US)
Waveguides
A folded waveguide coupler for ion cyclotron heating, 12:17541 (J;US)

IDAHO CHEMICAL PROCESSING PLANT
Construction
Design and construction status of the fuel processing facility, 12:15392 (J;US)
Design
Design and construction status of the fuel processing facility, 12:15392 (J;US)

IDAHO NATIONAL ENGINEERING LABORATORY
Prior to 1976 known as NRTS and older material is so indexed.
Decommissioning
Idaho National Engineering Laboratory release criteria for decontamination and decommissioning, 12:15551 (RA;US)
Decontamination
Idaho National Engineering Laboratory release criteria for decontamination and decommissioning, 12:15551 (RA;US)

IEA
See INTERNATIONAL ENERGY AGENCY

ILLUMINATION SYSTEMS
See LIGHTING SYSTEMS

IMAGE INTENSIFIERS
Streak Photography
Utilisation of image intensifiers used in conjunction with streak cameras, 12:16670 (R;FR;In French)

IMAGE PROCESSING
Algorithms
Realization of one algorithm for track elements isolation in analyzing the images of nuclear interactions, 12:16638 (R;SU;In Russian)

IMPERFECTIONS
See DEFECTS

IMPERMEABLE DRY ROCK
See HOT-DRY-ROCK SYSTEMS

IMPURITIES
Unwanted constituents, not for TRACE AMOUNTS, INTERFERING ELEMENTS, or metal and nonmetal additions.
Control
Pump limiter experiments and engineering, 12:17577 (J;US)
The tritium system for a tokamak with a self-pumped limiter, 12:17611 (J;US)

INCIDENTS
See ACCIDENTS

INCINERATION
See COMBUSTION

INCONEL 600
Intergranular Corrosion
Compilation of corrosion data on the CAN-DECON process: Volume 5, Influence of the CAN-DECON process on stress corrosion cracking: Summary of testing, 1984-1985: Final report, 12:15768 (R;US)
Performance
Understanding and protecting steam generator materials, 12:15813 (J;US)
Reactor Materials
Compilation of corrosion data on the CAN-DECON process: Volume 5, Influence of the CAN-DECON process on stress corrosion cracking: Summary of testing, 1984-1985: Final report, 12:15768 (R;US)
Stress Corrosion
Compilation of corrosion data on the CAN-DECON process: Volume 5, Influence of the CAN-DECON process on stress corrosion cracking: Summary of testing, 1984-1985: Final report, 12:15768 (R;US)

INCONEL 718
Mechanical Properties
Behavior of an Inconel 718 container in the presence of hydrogen. Final report (Spacecraft fuel tanks), 12:16270 (R;FR;In French)

INCONEL ALLOYS
See also INCONEL 600
INCONEL 718
Corrosion
Materials compatibility during the chlorination of molten $CaCl_2$. CaO salts, 12:16282 (R;US)

IN-CORE FUEL MANAGEMENT
See FUEL MANAGEMENT

INDIA
Nuclear Energy
Annual report 1985-1986 [of the Department of Atomic Energy of the Government of India], 12:17636 (R;IN)
Nuclear Power
Economic case for small and medium power reactors in India, 12:15872 (RA;XA)
Power Reactors
Indian experience in investment cost in Small Size Nuclear Power Reactor Units, 12:15886 (RA;XA)

INDIAN POINT-2 REACTOR
Buchanan, New York, USA
Feedwater
Sound measures feedwater temperature within 1°F consistently, 12:15832 (J;US)

INDICATOR SPECIES
See BIOLOGICAL INDICATORS

INDIUM 111
Labelled Compounds
Synthesis of 1-(p-isothiocyanatobenzyl) derivatives of DTPA and EDTA. Antibody labeling and tumor-imaging studies, 12:16841 (J;US)

INDIUM ARSENIDES
Crystal Growth
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Microhardness
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Molecular Beam Epitaxy
Superlattice structures grown by molecular beam epitaxy, 12:16371 (BA;US)
Photoconductivity
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Superlattices
Superlattice structures grown by molecular beam epitaxy, 12:16371 (BA;US)

INDIUM PHOSPHIDES
Crystal Growth
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)

Microhardness
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Photoconductivity
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)

INDIUM SELENIDES
Crystal Growth
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Microhardness
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Photoconductivity
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)

INDOLES
Biological Accumulation
Uptake and fate of xenobiotics in plants, 12:16891 (RA;US)
Root Absorption
Uptake and fate of xenobiotics in plants, 12:16891 (RA;US)

INDONESIA
Nuclear Power Plants
Commercial bank contribution in the financing of nuclear plant export contracts, 12:15902 (RA;XA)

INDOOR AIR POLLUTION
Air Pollution Abatement
Assessment of assay methods for evaluating asbestos abatement technology at the Corvallis Environmental Research Laboratory, 12:16716 (R;US)

INDUSTRIAL PLANTS
See also COAL GASIFICATION PLANTS
COAL LIQUEFACTION PLANTS
FEED MATERIALS PLANTS
ISOTOPE SEPARATION PLANTS
METHANOL PLANTS
Air Pollution Monitoring
Development of a coherent optical particle spectrometer for industrial applications: a feasibility investigation, 12:16725 (R;US)

INDUSTRIAL SECTOR
See INDUSTRY

INDUSTRIAL WASTES
Hazardous Materials
Protection of ground water by immobilization of heavy metals in industrial-waste-impacted soil systems, 12:16776 (R;US)
Waste Processing
Waste/soil treatability studies for four complex industrial wastes: methodologies and results. Volume 1. Literature assessment, waste/soil characterization, loading-rate selection. Final report, 12:16221 (R;US)
Waste/soil treatability studies for four complex industrial wastes: methodologies and results. Volume 2. Waste loading impacts on soil degradation, transformation, and immobilization. Final report, 12:16222 (R;US)

INDUSTRY
See also CEMENT INDUSTRY
GLASS INDUSTRY
METAL INDUSTRY
PETROLEUM INDUSTRY
Cooperation
Cooperative R and D ventures: An opportunity for leveraged research in fossil energy, 12:15266 (R;US)
Energy Conservation
Energy savings in the industrial sector - An overview, 12:16223 (BA;US)
Fuel Consumption
Multistate EIA-857 respondent report 1984: Final report, 12:15366 (R;US)
Power Demand
Industrial end-use planning methodology (INDEPTH): Demonstration of design: Volume 1, Econometric forecasting models: Interim report, 12:16182 (R;US)

INERTIAL CONFINEMENT
A dynamic plasma confinement by inertial forces.
Energy Transfer
Equations of one-dimensional radiative hydrodynamics with thermal conductivity and kinetics of thermonuclear burning, 12:17436 (R;SU;In Russian)
Fuel Pellets
Multishell inertial confinement fusion target, 12:17491 (P;US)
Hilacs
A comparison of the design and costs of induction LINAC drivers for inertial fusion using ions of mass 133 and 200, 12:17616 (J;US)
Neutron Cameras
A fiber sensor neutron streak camera for ICF diagnostics, 12:17569 (J;US)
Streak Cameras
A fiber sensor neutron streak camera for ICF diagnostics, 12:17569 (J;US)
Targets
Multishell inertial confinement fusion target, 12:17491 (P;US)
Thermal Conductivity
Equations of one-dimensional radiative hydrodynamics with thermal conductivity and kinetics of thermonuclear burning, 12:17436 (R;SU;In Russian)

INERTIAL CONFINEMENT FUSION DEVICES
See ICF DEVICES

INFORMATION SYSTEMS
Advanced sensors, telecommunications and data processing: Technological spin-offs from the Strategic Defense Initiative, 12:17632 (R;US)

INFRARED RADIATION
Skin Absorption
Study of infra-red radiation characteristics: 2, Effect of infra-red radiation heating on the human body, 12:16883 (TG;GB)

INFRARED SPECTROMETERS
Calibration
Research in planetary astronomy, 12:16970 (RA;US)
Sensitivity
Planetary infrared astronomy using a cryogenic postdisperser on Fourier transform spectrometers, 12:16977 (RA;US)
Specifications
Space infrared telescope facility wide field and diffraction limited array camera (IRAC). Semiannual status report, 1 March-31 August 1986, 12:16673 (R;US)

INHIBITORS (CORROSION)
See CORROSION INHIBITORS

INSECTICIDES
See also DIELDRIN
Field Tests
Incidence of fusiform rust infection on loblolly pine related to tip moth damage, 12:16886 (R;US)

IN-SITU COMBUSTION
Bench-Scale Experiments
Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 45, Quarter ending December 31, 1985, 12:15353 (R;US)
Combustion Kinetics
Experimental and theoretical studies of reverse combustion in porous media, 12:15331 (BA;US)
Reverse Combustion
Experimental and theoretical studies of reverse combustion in porous media, 12:15331 (BA;US)

INSPECTION
Optical Filters
Optical fiber inspection system, 12:16676 (P;US)

INSTITUTE FOR REACTOR SAFETY

INTERPLANETARY SPACE
Ultraviolet Spectra
Stellar observations with the Voyager EUV objective grating spectrograph, 12:17020 (RA;US)
INTERSTELLAR SPACE
Infrared Spectra
Infrared absorption and emission characteristics of interstellar PAHs [Polycyclic Aromatic Hydrocarbon], 12:16941 (R;US)
Polycyclic Aromatic Hydrocarbons
Infrared absorption and emission characteristics of interstellar PAHs [Polycyclic Aromatic Hydrocarbon], 12:16941 (R;US)
INTOR TOKAMAK
International Tokamak Reactor.
Design
International Tokamak Reactor (INTOR), 12:17495 (J;US)
INVAR
Physical Radiation Effects
Ion-induced spinodal-like decomposition of Fe-Ni-Cr Invar alloys, 12:16277 (R;US)
IODIDES
See also GOLD IODIDES
MOLYBDENUM IODIDES
Crystal Lattices
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ ($X^- = IBr_2^-$, AuI_3^-, I_3^-), 12:16412 (J;US)
Electron-Phonon Coupling
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ ($X^- = IBr_2^-$, AuI_3^-, I_3^-), 12:16412 (J;US)
Environmental Transport
Interpretative analysis of data for solute transport in the unsaturated zone, 12:15440 (R;US)
Transition Temperature
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ ($X^- = IBr_2^-$, AuI_3^-, I_3^-), 12:16412 (J;US)
IODINE
Detection
Thin-film chemical sensors based on electron tunneling: Final report, 12:17342 (R;US)
Volatility
Effects of organic impurities on the partitioning of iodine, 12:16105 (J;US)
IODINE 109
Proton Emission Decay
Ground-state proton radioactivity in the region of neutron-deficient nuclei above the tin, 12:17229 (R;DE;In German)
IODINE 123
Radioimmunoassay
Which collimator for SPECT with I-123 and CU-67, 12:16820 (J;US)
Therapeutic Uses
Which collimator for SPECT with I-123 and CU-67, 12:16820 (J;US)
IODINE 125
Uptake
Some factors affecting the uptake of iodoamphetamine (IAMP), 12:16824 (J;US)
IODINE BROMIDES
Crystal Lattices
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ ($X^- = IBr_2^-$, AuI_3^-, I_3^-), 12:16412 (J;US)
Electron-Phonon Coupling
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ ($X^- = IBr_2^-$, AuI_3^-, I_3^-), 12:16412 (J;US)
Transition Temperature
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ ($X^- = IBr_2^-$, AuI_3^-, I_3^-), 12:16412 (J;US)

Charge Exchange
Collisional dynamics of low energy charge transfer processes, 12:17077 (RA;CS)
Electron Capture
Charge transfer in 1.4 MeV/u Ni/sup q+/ -> Kr collisions, q=16-22, 12:17071 (R;DE)
Excited States
Atomic physics of strongly correlated systems: Progress report, 1 August 1984 through 31 July 1985, 12:17068 (R;US)
Mathematical Models
An overview of low-energy ion-atom collisions, 12:17067 (R;US)
Pair Production
Scalar magnetic (e/sup +/e/sup -/) resonance as possible source of an anomalous e/sup +/ peak in heavy-ion collisions, 12:17084 (J;NL)
ION-DRAG ACCELERATORS
See ELECTRON-RING ACCELERATORS
IONIC CRYSTALS
Grain Boundaries
Computer simulation of "special" grain boundaries in metals and ionic materials, 12:16247 (R;US)
IONIC REACTIONS
See IONS
ION-ION COLLISIONS
Biophysics
Structured ion impact: double differential cross sections, 12:17316 (RA;US)
Differential Cross Sections
Theoretical cross sections for ionization structured ions, 12:17317 (RA;US)
IONIZATION CALORIMETERS
See SHOWER COUNTERS
IONIZATION CHAMBERS
Computerized Simulation
Development and testing of a Monte Carlo code system for analysis of ionization chamber responses, 12:16661 (J;US)
Design
Portable wide range instrument for beta radiation monitoring with minimum angular dependence, 12:16598 (RA;US)
Performance
Comparison of the response of a NaI scintillation crystal with a pressurized ionization chamber as a function of altitude, radiation level, and Ra-226 concentration, 12:15530 (RA;US)
Portable wide range instrument for beta radiation monitoring with minimum angular dependence, 12:16598 (RA;US)
IONIZING RADIATIONS
See also COSMIC RADIATION
GAMMA RADIATION
X RADIATION
Uses
CSKAE activity in the field of ionizing radiation applications in agriculture and food industry, 12:16845 (RA;CS;In Czech)
ION-MOLECULE COLLISIONS
Charge Exchange
Collisional dynamics of low energy charge transfer processes, 12:17077 (RA;CS)
Inelastic Scattering
Time of flight experiments of the and H/sup +/ scattered from molecules and solid surfaces, 12:17072 (RA;CS)
IONOSPHERE
Cosmic Electrons
Energy spectra of secondary electrons with E>100 MeV at altitudes of 300-500km for shells of L=2-4, 12:17284 (RA;SU;In Russian)
IONS
Ions in solutions are indexed as compounds; ions in gases by the precoordinated descriptor consisting of the element name and the term ions; ions in beams by assigning either the specific name if available, e.g. ARGON 40 BEAMS
See also ANIONS
DEUTERIUM IONS

MULTICHARGED IONS
NICKEL IONS
Acceleration
Particle acceleration by turbulent plasmas, 12:16946 (RA;CS)
Chemical Reaction Yield
Ion yields in liquid water, 12:17322 (RA;US)
Total ion and electron yields, 12:17318 (RA;US)
Resonance Ionization Mass Spectroscopy
High efficiency direct detection of ions from resonance ionization of sputtered atoms, 12:16396 (P;US)
IOWA
Atmospheric Precipitations
Tree ring chronology indexes and reconstructions of precipitation in Central Iowa, USA, 12:16689 (R;US)
IPNS-I SYNCHROTRON
Intense Pulsed Neutron Source.
Targets
Progress on the IPNS Enriched Uranium Booster Target, 12:16542 (R;US)
IRIDIUM ISOTOPES
Rotational States
High-spin states and coexisting states in the Pt-Au transition region, 12:17235 (R;US)
IRON
Catalytic Effects
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Final quarterly technical progress report No. 4 for the period 1 July to 30 September 1986, 12:15284 (R;US)
Chemical Reactions
Gas-phase chemical reactions of transition metal clusters with simple molecules, 12:16401 (R;US)
Cross Sections
Evaluation and testing of double differential Fe(n,n') cross sections, 12:17327 (J;US)
Crystal Defects
Methane-bubble formation in hydrogen-charged Fe-30 ppm C, 12:16311 (BA;US)
Dislocations
Methane-bubble formation in hydrogen-charged Fe-30 ppm C, 12:16311 (BA;US)
Electrodeposition
Electroforming with nickel, iron, and aluminum, 12:16298 (R;US)
Emission Spectroscopy
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Hydrogen Additions
Methane-bubble formation in hydrogen-charged Fe-30 ppm C, 12:16311 (BA;US)
Inclusions
Methane-bubble formation in hydrogen-charged Fe-30 ppm C, 12:16311 (BA;US)
Magnetic Properties
Magnetic properties of novel epitaxial films, 12:16254 (R;US)
Neutron Reactions
Calculation of damage cross section, 12:17305 (R;IN)
IRON 54
Dimensions
Muonic isotope shifts in the even Fe nuclei, 12:17224 (J;US)
Spectral Shift
Muonic isotope shifts in the even Fe nuclei, 12:17224 (J;US)
IRON 54 TARGET
Nickel 58 Reactions
Ground-state proton radioactivity in the region of neutron-deficient nuclei above the tin, 12:17229 (R;DE;In German)
IRON 56
Dimensions
Muonic isotope shifts in the even Fe nuclei, 12:17224 (J;US)
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Muonic isotope shifts in the even Fe nuclei, 12:17224 (J;US)
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)

IRON 56 TARGET
Neutron Reactions
Measurement of inelastically scattering neutron spectra from the (n,n'γ) reaction on iron nuclei, 12:17213 (R;SU;In Russian)
IRON 58
Dimensions
Muonic isotope shifts in the even Fe nuclei, 12:17224 (J;US)
Spectral Shift
Muonic isotope shifts in the even Fe nuclei, 12:17224 (J;US)
IRON ALLOYS
See also HASTELLOYS
INCONEL 600
IRON BASE ALLOYS
VANSTAR 7
Corrosion Resistance
Passivation of P-implanted Fe-Cr amorphous alloys, 12:16297 (R;US)
Ion Implantation
Passivation of P-implanted Fe-Cr amorphous alloys, 12:16297 (R;US)
IRON BASE ALLOYS
See also INVAR
STEELS
Physical Radiation Effects
Ion-induced spinodal-like decomposition of Fe-Ni-Cr Invar alloys, 12:16277 (R;US)
Tensile Properties
Effect of aluminum addition on ductility and yield strength of Fe_3Al alloys with 0.5 wt % TiB_2, 12:16258 (R;US)
Mechanical properties of various alloys in hydrogen. Final report, 12:16289 (R;US)
IRON COMPOUNDS
See also FERRITES
IRON SILICIDES
Air Pollution Control
Studies on air pollution by lead, zinc, iron, and 3,4-benzopyrene due to traffic in a small town, 12:16235 (R;DE;In German)
Crystal Structure
Further aspects of the structure and magnetism of the layered compound Fe(III)ClMoO4: Moessbauer spectroscopy, susceptibility, and powder neutron diffraction studies, 12:16335 (J;US)
Environmental Impacts
Studies on air pollution by lead, zinc, iron, and 3,4-benzopyrene due to traffic in a small town, 12:16235 (R;DE;In German)
Magnetic Susceptibility
Further aspects of the structure and magnetism of the layered compound Fe(III)ClMoO4: Moessbauer spectroscopy, susceptibility, and powder neutron diffraction studies, 12:16335 (J;US)
IRON METEORITES
X-Ray Fluorescence Analysis
Applications of synchrotron x-ray fluorescence to extraterrestrial materials, 12:16535 (R;US)
IRON SILICIDES
Reduction
Fuel savings by controlling SiO/sub 2/ reduction in blast furnaces. Pt. 1. Laboratory research into the mechanism of SiO/sub 2/ reduction. Final report, 12:16239 (R;DE;In German)
IRON-NICKEL BATTERIES
Performance
Temperature effects on nickel/iron battery characteristics, 12:16149 (R;US)
ISLANDS

Neutron Emission
Neutron emission from lead bombarded with 14 MeV neutrons, 12:17237 (RA;CS)
Neutron Reactions
Neutron emission from lead bombarded with 14 MeV neutrons, 12:17237 (RA;CS)

LEAD 208 TARGET
Alpha Reactions
Pion multiplicity in α-nucleus reactions from 200 to 800 A. MeV, 12:17205 (R;FR)
Carbon 12 Reactions
Giant resonance excitation by inelastic scattering of medium energy ^{12}C ions, 12:17233 (R;FR)
Neutron Emission
Neutron emission from lead bombarded with 14 MeV neutrons, 12:17237 (RA;CS)
Neutron Reactions
Neutron emission from lead bombarded with 14 MeV neutrons, 12:17237 (RA;CS)

Proton Reactions
Noneikonal effects in cross sections of proton reactions on nuclei, 12:17282 (RA;SU;In Russian)
LEAD 210
Tissue Distribution
Age dependent retention of ^{212}Pb in the skeleton following ^{224}Ra uptake, 12:16857 (R;US)
LEAD 212
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
LEAD COMPOUNDS
See also LEAD OXIDES
PZT
Air Pollution Control
Studies on air pollution by lead, zinc, iron, and 3,4-benzopyrene due to traffic in a small town, 12:16235 (R;DE;In German)
Environmental Impacts
Studies on air pollution by lead, zinc, iron, and 3,4-benzopyrene due to traffic in a small town, 12:16235 (R;DE;In German)
LEAD OXIDES
Fracture Mechanics
Fracture mechanisms in lead zirconate titanate ceramics, 12:16338 (BA;US)
LEAD ZIRCONITE TITANATE

See LFR REACTOR

LOW-LEVEL RADIOACTIVE WASTES
Classification
Cost effectiveness of below-threshold waste disposal at DOE sites, 12:15465 (J;US)
Defining greater-than-class-C low-level radioactive waste, 12:15453 (J;US)
Disposal of BRC wastes containing short-lived radionuclides, 12:15457 (J;US)
Evaluation
Evaluation of potential mixed wastes containing lead, chromium, used oil, or organic liquids, 12:15439 (R;US)
Ground Disposal
Site characterization field manual for near surface geologic disposal of low-level radioactive waste, 12:15422 (R;US)
Inventories
The Integrated Data Base program: An executive-level data base of spent fuel and radioactive waste inventories, projections, and characteristics, 12:15417 (R;US)
Liquid Wastes
Alternative low-level waste processing techniques, 12:15467 (J;US)
Operating a transportable volume reduction and solidification system (TVR-III), 12:15468 (J;US)
Prediction of critical grout parameters: critical flow rate, 12:15469 (J;US)
Radiation Hazards
Criteria for waste-related risks to be below regulatory concern, 12:15456 (J;US)
Radioactive Waste Disposal
Approach to defining de minimis, intermediate, and other classes of radioactive waste, 12:15459 (J;US)
Cost effectiveness for improved methods of low-level radioactive waste disposal, 12:15463 (J;US)
Cost effectiveness of below-threshold waste disposal at DOE sites, 12:15465 (J;US)
Criteria for waste-related risks to be below regulatory concern, 12:15456 (J;US)
Defining greater-than-class-C low-level radioactive waste, 12:15453 (J;US)
Disposal of slightly contaminated radioactive wastes from nuclear power plants, 12:15540 (RA;US)
Disposal of BRC wastes containing short-lived radionuclides, 12:15457 (J;US)
Economic considerations for nuclear power plant LLW, 12:15464 (J;US)
Economics of disposal at future disposal facilities, 12:15460 (J;US)
Effect of technology on the economics of low-level waste disposal, 12:15461 (J;US)
Evaluation of the potential for deregulated disposal of very low level wastes from nuclear power plants, 12:15455 (J;US)
Evaluation of potential mixed wastes containing lead, chromium, used oil, or organic liquids, 12:15439 (R;US)
Feasibility of centralizing disposal and processing facilities for low-level biomedical waste, 12:15541 (RA;US)
Modeling the economics of LLW volume reduction, 12:15462 (J;US)
Northrop Triga facility decommissioning plan versus actual results, 12:16066 (J;US)
Proposed classification scheme for high-level and other radioactive wastes, 12:15458 (J;US)
Standard format and content of a license application for a low-level radioactive waste disposal facility: Safety analysis report, 12:15435 (R;US)
Radioactive Waste Management
Problems of interpretation in implementing the low-level waste act, 12:15470 (J;US)
Radioactive Waste Processing
Alternative low-level waste processing techniques, 12:15467 (J;US)
Economic considerations for nuclear power plant LLW, 12:15464 (J;US)
Low and medium level liquid waste processing at the new La Hague reprocessing plant, 12:15411 (R;FR;In French)
Prediction of critical grout parameters: critical flow rate, 12:15469 (J;US)
Radioactivity
Disposal of slightly contaminated radioactive wastes from nuclear power plants, 12:15540 (RA;US)
Using a HPGe detector and micro R meter for quick and simple estimate of radionuclide activity in LSA shipping containers, 12:15531 (RA;US)
Regulations
Criteria for waste-related risks to be below regulatory concern, 12:15456 (J;US)
Problems of interpretation in implementing the low-level waste act, 12:15470 (J;US)
Sludges
Prediction of critical grout parameters: critical flow rate, 12:15469 (J;US)
Solidification
Operating a transportable volume reduction and solidification system (TVR-III), 12:15468 (J;US)
Quality assurance consideration for cement-based grout technology programs at Oak Ridge National Laboratory, 12:15414 (R;US)
Underground Disposal
Monitoring of heat and moisture migration from radioactive waste disposed in an augered shaft, 12:15418 (R;US)
Volume
Modeling the economics of LLW volume reduction, 12:15462 (J;US)

LP-GAS
See LIQUEFIED PETROLEUM GASES

LUCIE-2 REACTOR
Reactor Cooling Systems
Vibration monitoring/diagnostic techniques, as applied to reactor coolant pumps, 12:15823 (J;US)

LUNGS
Adenomas
Lifetime studies with mice after exposure to a high-boiling complex organic mixture, 12:15339 (RA;US)

Biological Radiation Effects
Neptunium-237 inhalation in rats, 12:16880 (J;US)
Carcinomas
Lifetime studies with mice after exposure to a high-boiling complex organic mixture, 12:15339 (RA;US)
Neoplasms
Factors affecting the carcinogenicity of inhaled particle-organic mixtures, 12:16894 (RA;US)
Responses of the respiratory tract to inhaled particle-organic mixtures, 12:16893 (RA;US)
Sensitivity
Developmental effects in rats and mice after dermal exposure to a high-boiling complex organic mixture, 12:15337 (RA;US)

LWBR TYPE REACTORS
Fuel Pellets
In-pile and out-of-pile corrosion behavior of thoria-urania pellets (LWBR [Light Water Breeder Reactor] Development program), 12:15857 (R;US)
Reactor Cores
Qualification of an LWBR-irradiated fuel assay gauge, 12:15864 (J;US)

LWGR TYPE REACTORS
See also CHERNOBYLSK-1 REACTOR
CHERNOBYLSK-4 REACTOR
N-REACTOR
Data
Small and medium power reactors in the Soviet power-generating industry, 12:15801 (RA;XA)
Safety
Small and medium power reactors in the Soviet power-generating industry, 12:15801 (RA;XA)

LWR TYPE REACTORS
See WATER COOLED REACTORS

LYMPHOCYTES
DNA Repair
Levels of uracil DNA glycosylase and AP endonuclease in murine B- and T-lymphocytes do not change with age, 12:16798 (J;CH)
Gene Mutations
Human lymphocyte mutagenicity assay, 12:16898 (RA;US)

LYMPHOID CELLS
See LYMPHOCYTES

M

MA 754
See NICKEL BASE ALLOYS

MA 956
See IRON BASE ALLOYS

MACACA
See MACACUS

MACACUS
Lethal Radiation Dose
Animal mortality resulting from uniform exposures to photon radiations: Calculated LD_{50}s and a compilation of experimental data, 12:16859 (R;US)

MACERALS
Dissolution
Mild oxidative solubilization of coal macerals, 12:15300 (R;US)
Structural Chemical Analysis
Mild oxidative solubilization of coal macerals, 12:15300 (R;US)

MAGMA
Cobalt
Thermochemical study of the distribution of cobalt and nickel between diopsidic pyroxene and melt, 12:16931 (J;US)
Nickel
Thermochemical study of the distribution of cobalt and nickel between diopsidic pyroxene and melt, 12:16931 (J;US)

MAGMA SYSTEMS
Heat Recovery
Magma energy extraction, 12:15630 (R;US)

MAGNESIUM
Emission Spectroscopy
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)

MAGNESIUM 24 REACTIONS
Elastic Scattering
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)
Incomplete Fusion Reactions
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)

MAGNESIUM 24 TARGET
Magnesium 24 Reactions
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)
Neutron Reactions
Neutron scattering on light even-even nuclei, 12:17214 (RA;CS)
Sulfur 32 Reactions
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)

MAGNESIUM ALLOYS
X-Ray Spectra
Soft x-ray emission studies of several aluminum alloys, 12:16293 (R;US)

MAGNESIUM OXIDES
Absorption Spectroscopy
Physical properties of oxide containing metal precipitates. Part II, 12:16344 (J;GB)
Breakdown
Electrolytic coloration and electrical breakdown of MgO single crystals, 12:16343 (J;US)
Coloration
Electrolytic coloration and electrical breakdown of MgO single crystals, 12:16343 (J;US)
Crystal Defects
Physical properties of oxide containing metal precipitates. Part II, 12:16344 (J;GB)
Impurities
Electrolytic coloration and electrical breakdown of MgO single crystals, 12:16343 (J;US)
Mechanical Properties
Physical properties of oxide containing metal precipitates. Part II, 12:16344 (J;GB)
Microstructure
Physical properties of oxide containing metal precipitates. Part II, 12:16344 (J;GB)

MAGNET COILS
Composite Materials
System studies of Compact Ignition Tokamaks, 12:17535 (J;US)
Cooling
Liquid nitrogen cooling considerations of the Compact Ignition Tokamak, 12:17486 (R;US)
Design
Critical field index for passive coil stabilization of the shift instability, 12:17458 (RA;US)

MAGNETIC BREMSSTRAHLUNG
See SYNCHROTRON RADIATION

MAGNETIC COILS
See MAGNET COILS

MAGNETIC MONOPOLES
Magnetic monopoles: from classical to quantum physics, 12:17154 (R;FR)
Cosmology
Monopole abundance from first order GUT phase transition of the early Universe, 12:16961 (R;HU)

Unified Gauge Models
Monopole abundance from first order GUT phase transition of the early Universe, 12:16961 (R;HU)
MAGNETIC SHIELDING
Neutron Leakage
Study of neutron leakage through an Fe shield at an accelerator, 12:16517 (J;US)
MAGNETIC SPECTROMETERS
Calibration
EhLEKTRON magnetic spectrometer calibration, 12:16605 (R;SU;In Russian)
MAGNETIC STORMS
Solar-Geophysical Data Number 504, August 1986. Part 1 (prompt reports). Data for July 1986, June 1986, and late data, 12:17050 (R;US)
Solar-Geophysical Data Number 505, September 1986. Part 1 (prompt reports). Data for August 1986, July 1986, and late data, 12:17052 (R;US)
Solar-Geophysical Data Number 505, September 1986. Part 2 (comprehensive reports). Data for March, and miscellanea, 12:17053 (R;US)
MAGNETOHYDRODYNAMIC GENERATORS
See MHD GENERATORS
MAGNETOHYDRODYNAMICS
Convection
Magnetoconvection, 12:17090 (RA;CS)
Turbulence
Magnetohydrodynamic turbulence, 12:17089 (RA;CS)
MAGNETOPAUSE
Stability
Magnetopause stability threshold for patchy reconnection, 12:16949 (RA;CS)
MAHOGANY TREES
See TREES
MALIGNANCIES
See NEOPLASMS
MAMMARY GLANDS
Neoplasms
In vivo monitoring of line 168 mammary tumors by topical nuclear magnetic resonance, 12:16823 (J;US)
NMR Imaging
In vivo monitoring of line 168 mammary tumors by topical nuclear magnetic resonance, 12:16823 (J;US)
MAN
All of mankind, of any age or of either sex.
Behavior
Ventilation and occupant behavior in two apartment buildings, 12:16203 (R;US)
MANGANESE
Emission Spectroscopy
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Oxidation
Studies on manganese oxidizing spore forming bacteria, 12:16839 (RA;US)
MANGANESE 55
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
MANGANESE ALLOYS
X-Ray Spectra
Soft x-ray emission studies of several aluminum alloys, 12:16293 (R;US)
MANGANESE SULFATES
Calibration Standards
Analysis of rare earths and cadmium in reference materials: Li_2SO_4 and $MnSO_4$, 12:16386 (R;FR)
MANGANESE TELLURIDES
Crystal Growth
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Microhardness
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Photoconductivity
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
MANHATTAN PROJECT
Historical Aspects
Hanford defense mission: Past, present and future, 12:17631 (R;US)
MANIPULATORS
Comparative Evaluations
Manipulator comparative testing program, 12:16453 (J;US)
Computer Graphics
Interactive animated displayed of man-controlled and autonomous robots, 12:16459 (J;US)
MANUFACTURING FACILITIES
See INDUSTRIAL PLANTS
MANY-BODY PROBLEM
See also FOUR-BODY PROBLEM
THREE-BODY PROBLEM
TWO-BODY PROBLEM
Monte Carlo Method
Variational Monte Carlo calculations of few-body nuclei, 12:17206 (R;US)
Reviews
[International conference and symposium on unified concepts of many-body problems]: Symposium summary, 12:17298 (R;US)
MAPLES
Photosynthesis
Seasonal patterns of leaf photosynthetic capacity in successional northern hardwood tree species, 12:16805 (J;US)
MARINE DISPOSAL
Simulation
Pore-water pressure events during the in situ heat transfer experiment simulation: Piezometer probe technology, 12:15450 (R;US)
MARINE ECOSYSTEMS
See AQUATIC ECOSYSTEMS
MARINE VEHICLE ACCIDENTS
See ACCIDENTS
MARS PLANET
Brightness
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)
Carbon Dioxide
Planetary Fabry-Perot spectroscopy, 12:16992 (RA;US)
Carbon Monoxide
Planetary Fabry-Perot spectroscopy, 12:16992 (RA;US)
Microwave Spectra
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)
Oxygen
Planetary Fabry-Perot spectroscopy, 12:16992 (RA;US)
Planetary Atmospheres
Advanced infrared astronomy, 12:16971 (RA;US)
Water Vapor
Planetary Fabry-Perot spectroscopy, 12:16992 (RA;US)
MARS REACTOR
Breeding Blankets
Neutronics analysis for aqueous self-cooled fusion reactor blankets, 12:17594 (J;US)
MARSHES
Bacteria
Feeding relationships of harpacticoid copepods and microbial flora in a salt marsh, 12:16827 (RA;US)
MASERS
Microwave Amplification by Stimulated Emission of Radiation.

Radiation Sources
High power, millimeter-wavelength, coherent radiation sources. Final report, 1 February 1982-31 January 1986, 12:16487 (R;US)

MASKS
See RESPIRATORS

MASS SPECTROSCOPY
Time-of-Flight Spectrometers
Double-arm time-of-flight spectrometer for the DEMAS installation, 12:16629 (R;SU;In Russian)

MASS TRANSIT SYSTEMS
Economic Analysis
National urban mass transportation statistics. 1983 Section 15 annual report. Transit financial and operating data reported for years ending between January 1, 1983 and December 31, 1983, 12:16210 (R;US)
National urban mass transportation statistics. 1981 Section 15 report. Transit financial and operating data reported for fiscal year ending between July 1, 1980 and June 30, 1981. Annual report, 12:16211 (R;US)
National urban mass transportation statistics. 1981 Section 15 report. Transit financial and operating data reported for fiscal year ending between July 1, 1980 and June 30, 1981. Supplement, 12:16212 (R;US)
National urban mass transportation statistics. Second annual report. Section 15 reporting system. Transit financial and operating data reported for fiscal year ending between July 1, 1979 and June 30, 1980, 12:16213 (R;US)
National urban mass transportation statistics. 1982 Section 15 annual report. Transit financial and operating data reported for fiscal year ending between July 1, 1981 and June 30, 1982, 12:16214 (R;US)
Energy Consumption
National urban mass transportation statistics. 1983 Section 15 annual report. Transit financial and operating data reported for years ending between January 1, 1983 and December 31, 1983, 12:16210 (R;US)
National urban mass transportation statistics. 1981 Section 15 report. Transit financial and operating data reported for fiscal year ending between July 1, 1980 and June 30, 1981. Annual report, 12:16211 (R;US)
National urban mass transportation statistics. 1981 Section 15 report. Transit financial and operating data reported for fiscal year ending between July 1, 1980 and June 30, 1981. Supplement, 12:16212 (R;US)
National urban mass transportation statistics. Second annual report. Section 15 reporting system. Transit financial and operating data reported for fiscal year ending between July 1, 1979 and June 30, 1980, 12:16213 (R;US)
National urban mass transportation statistics. 1982 Section 15 annual report. Transit financial and operating data reported for fiscal year ending between July 1, 1981 and June 30, 1982, 12:16214 (R;US)

Turbine supervisory instrumentation, 12:15692 (RA;US)
Vibration signature analysis at Philadelphia Electric, 12:15690 (RA;US)

MEETINGS
Atomic physics 9, 12:17085 (B;SG)
Photon emission from irradiated solids: Proceedings of the Werner Brandt workshop on penetration phenomena, 12:17338 (R;US)

MELANOCYTES
See ANIMAL CELLS

MELUSINE-2 REACTOR
See SILOETTE REACTOR

MEMBER STATES
Countries participating in an international organization.
International Cooperation
Small and medium power reactors 1985. Report of two meetings on small and medium power reactors: A scientific afternoon held on 25 September 1985 and technical committee meeting held on 26 September 1985. Both meetings were held in Vienna during the General Conference of the IAEA, 12:15871 (R;XA)
Nuclear Power
Small and medium power reactors 1985. Report of two meetings on small and medium power reactors: A scientific afternoon held on 25 September 1985 and technical committee meeting held on 26 September 1985. Both meetings were held in Vienna during the General Conference of the IAEA, 12:15871 (R;XA)

MEMORY DEVICES
Data Processing
Memory division module MDP.2, 12:16671 (R;SU;In Russian)
Efficiency
The effectiveness of combining in shared memory parallel computers in the presence of 'hot spots', 12:17674 (BA;US)
System Failure Analysis
The effectiveness of combining in shared memory parallel computers in the presence of 'hot spots', 12:17674 (BA;US)

MERCURY
Detection
Thin-film chemical sensors based on electron tunneling: Final report, 12:17342 (R;US)
Photoemission
Gas-phase photoemission with soft x-rays: Cross sections and angular distributions, 12:16531 (BA;US)

MERCURY CHLORIDES
Carcinogen Screening
Toxicokinetics of model compounds, 12:16888 (RA;US)

MESH GENERATION
Mathematical Operators
A diffusion operator for Lagrangian meshes, 12:17659 (R;US)

MESOCRICETUS
See HAMSTERS

MESON FACTORIES
The TRIUMF kaon factory proposal, 12:16569 (R;CA)

MESON-DEUTERON INTERACTIONS
See DEUTERIUM TARGET

MESSENGER-RNA
Biochemical Reaction Kinetics
Oxygen-regulated mRNAs for light-harvesting and reaction center complexes and for bacteriochlorophyll and carotenoid biosynthesis in Rhodobacter capsulatus during the shift from anaerobic to aerobic growth, 12:16796 (J;US)

METAGALAXY
See UNIVERSE

METAL INDUSTRY
Energy Conservation
Roles of electricity: Electric steelmaking, 12:16220 (R;US)
Hazardous Materials
Industrial-hygiene survey report, Precision Castparts Corp., Portland, Oregon (2-ethoxyethanol), 12:16713 (R;US)

METALLIC GLASSES
Corrosion Resistance
Passivation of P-implanted Fe-Cr amorphous alloys, 12:16297 (R;US)
Ion Implantation
Passivation of P-implanted Fe-Cr amorphous alloys, 12:16297 (R;US)
Passivation
Passivity of amorphous Ni-Cr-P alloys, 12:16296 (R;US)

METALS

ALUMINIUM
ANTIMONY
BISMUTH
CADMIUM
GALLIUM
GERMANIUM
LEAD
LIQUID METALS
MERCURY
REFRACTORY METALS
SCRAP METALS
TRANSITION ELEMENTS
ZINC
Corrosion Resistance
The corrosion of metals and alloys by sodium polysulfide melts at 350°C, 12:16253 (R;US)
Grain Boundaries
Computer simulation of "special" grain boundaries in metals and ionic materials, 12:16247 (R;US)
Ion Implantation
The role of energetic displacement cascades in ion beam modifications of materials, 12:16259 (R;US)
Physical Radiation Effects
The role of energetic displacement cascades in ion beam modifications of materials, 12:16259 (R;US)
Quantitative Chemical Analysis
Studies on heavy metals in household refuse and on heavy metals concentration in certain fractions or groups of materials by suitable treatment, 12:16774 (R;DE;In German)
Rolling
The effect of the cube texture component on the earing behavior of rolled f.c.c. metals, 12:16283 (R;US)
Texture
The effect of the cube texture component on the earing behavior of rolled f.c.c. metals, 12:16283 (R;US)

METEORITES
See also IRON METEORITES
Chemical Composition
Antarctic meteorite newsletter, volume 9, number 1, 12:17029 (R;US)
Infrared Spectra
Physical properties of asteroids, 12:17015 (RA;US)
Petrology
Antarctic meteorite newsletter, volume 9, number 1, 12:17029 (R;US)

METEOROLOGY
Diffusion
Evaluation of tetroon flights and turbulent diffusion under weak wind conditions during the field experiment SIESTA, 12:16688 (R;DE)
Influence of stability classification on atmospheric diffusion calculations for elevated releases over a terrain of major roughness, 12:16687 (R;DE)
Information Systems
Design and use of climatological data banks, with emphasis on the preparation and homogenization of surface monthly records, 12:16772 (J;NL)

METER WAVE RADIATION
See RADIOWAVE RADIATION
METHANE
Adsorption
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
Biosynthesis
Development of an advanced anaerobic digester design and a kinetic model for biogasification of water hyacinth/sludge blends, 12:15585 (R;US)
Chemical Reaction Yield
Recent developments in wet carbonization of peat, 12:15274 (R;US)
Combustion Kinetics
Combustion-torch ignition: Fluorescence imaging of NO/sub 2/, 12:15369 (BA;US)
High-resolution coherent anti-Stokes Raman spectroscopy measurements of carbon monoxide linewidths in a flame, 12:15370 (BA;US)
Ecological Concentration
Core processing and first analysis of ice cores from Siple and South Pole stations, 12:16767 (J;US)
Model study of the greenhouse effects due to increasing atmospheric CH_4, N_2O, CF_2Cl_2, and $CFCl_3$, 12:16760 (J;US)
Environmental Effects
Model study of the greenhouse effects due to increasing atmospheric CH_4, N_2O, CF_2Cl_2, and $CFCl_3$, 12:16760 (J;US)
Ignition
Combustion-torch ignition: Fluorescence imaging of NO/sub 2/, 12:15369 (BA;US)
Mixing
Combustion-torch ignition: Fluorescence imaging of NO/sub 2/, 12:15369 (BA;US)
High-resolution coherent anti-Stokes Raman spectroscopy measurements of carbon monoxide linewidths in a flame, 12:15370 (BA;US)
Spectroscopy
HALOE science investigation. Semiannual progress report, February-July 1986, 12:16705 (R;US)
METHANOL
Production
Methanol production from indigenous resources in New York State, 12:15591 (R;US)
Methanol production from indigenous resources in New York State. Volume 1. Executive summary, 12:15592 (R;US)
Methanol production from indigenous resources in New York State. Volume 2. Technical and economic evaluation of conversion process plants, 12:15593 (R;US)
Methanol production from indigenous resources in New York State. Volume 3. Technical and economic evaluation of conversion process plants, 12:15594 (R;US)
Synthesis
Liquefaction of natural gas to methanol for shipping and storage, 12:15589 (R;US)
Low temperature methanol process: The next step, 12:15588 (R;US)
Methanol for transportation of natural gas values, 12:15587 (R;US)
METHANOL FUELS
Pure methanol, methanol-water mixtures, or methanol with additives; for methanol-gasoline mixtures, use GASOHOL.
Production
Methanol production from indigenous resources in New York State, 12:15591 (R;US)
Methanol production from indigenous resources in New York State. Volume 1. Executive summary, 12:15592 (R;US)
Methanol production from indigenous resources in New York State. Volume 2. Technical and economic evaluation of conversion process plants, 12:15593 (R;US)
Methanol production from indigenous resources in New York State. Volume 3. Technical and economic evaluation of conversion process plants, 12:15594 (R;US)
METHANOL PLANTS
Capitalized Cost
Liquefaction of natural gas to methanol for shipping and storage, 12:15589 (R;US)
Low temperature methanol process: The next step, 12:15588 (R;US)
Methanol for transportation of natural gas values, 12:15587 (R;US)
Chemical Feedstocks
Liquefaction of natural gas to methanol for shipping and storage, 12:15589 (R;US)
Low temperature methanol process: The next step, 12:15588 (R;US)
Methanol for transportation of natural gas values, 12:15587 (R;US)
Design
Liquefaction of natural gas to methanol for shipping and storage, 12:15589 (R;US)
METHYL ALCOHOL

Double differential ionization cross sections, 12:17314 (RA;US)
Ionization
Double differential ionization cross sections, 12:17314 (RA;US)
Pion Minus Reactions
Secondary particle multiplicity in the π/sup -/Ne interactions at psub(π)=6.2 Gev/c, 12:17215 (R;SU;In Russian)

NEON 20 REACTIONS
Energy Dependence
Evolution of the fusion like process around the Fermi energy, 12:17227 (R;FR)
MeV Range 100-1000
Evolution of the fusion like process around the Fermi energy, 12:17227 (R;FR)

NEOPLASMS
See also CARCINOMAS
NMR Imaging
In vivo monitoring of line 168 mammary tumors by topical nuclear magnetic resonance, 12:16823 (J;US)
Radioimmunotherapy
In vivo monitoring of line 168 mammary tumors by topical nuclear magnetic resonance, 12:16823 (J;US)

NEPTUNE PLANET
Albedo
Visible phase curves of Uranus and Neptune and scattering in their atmospheres, 12:16993 (RA;US)
Brightness
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)
Heat Sources
Visible phase curves of Uranus and Neptune and scattering in their atmospheres, 12:16993 (RA;US)
Hydrogen
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions, 12:16989 (RA;US)
Methane
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions, 12:16989 (RA;US)
Infrared observations of planetary atmospheres, 12:16985 (RA;US)
Microwave Spectra
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)

NEPTUNIUM 236 TARGET
Neutron Reactions
Thermal neutron fission cross-sections of /sup 236/Np isomers, 12:17249 (RA;CS)

NEPTUNIUM 237
Ion Exchange
Recovery of /sup 238/Pu from irradiated /sup 237/Np using anion exchange method, 12:15381 (R;CN;In Chinese)
Lung Clearance
Neptunium-237 inhalation in rats, 12:16880 (J;US)
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Retention
Neptunium-237 inhalation in rats, 12:16880 (J;US)
Tissue Distribution
Neptunium-237 inhalation in rats, 12:16880 (J;US)

NEPTUNIUM OXIDES
Chemical Properties
Chemical behaviour of Np, Pu and Am in various concentrated salt solutions, 12:16429 (R;FR;In German)

NET TOKAMAK
Breeding Blankets
Applications of the Aqueous Self-Cooled Blanket concept, 12:17516 (J;US)
Composite beryllium-ceramics breeder pin elements for a gas cooled solid blanket, 12:17426 (R;FR)
Neutronics analysis for aqueous self-cooled fusion reactor blankets, 12:17594 (J;US)
Vacuum Systems
Development of large components for the fusion reactor vacuum circuits, 12:17427 (R;FR)

NETHERLANDS
Energy Policy
The Netherlands wind energy research and development program, 12:15656 (BA;US)
Wind Power
The Netherlands wind energy research and development program, 12:15656 (BA;US)

NEUTRALIZATION (CHEMICAL)
See PH VALUE

NEUTRAL-PARTICLE TRANSPORT
See also NEUTRON TRANSPORT
Numerical solution of transport equations with particle correction, 12:17356 (R;FR;In French)

NEUTRINO BEAMS
Beam Production
Beam dump neutrino experiments, 12:17108 (RA;CS)
Neutrino physics at future colliders, 12:17109 (RA;CS)
NEUTRINO OSCILLATION
Neutrino oscillations, 12:17134 (RA;CS)
Studying reactor antineutron oscillations with large underground detectors, 12:16596 (R;FR)
NEUTRINO REACTIONS
Inclusive Interactions
Study on the inclusive neutrino (antineutrino) interactions with nuclei at 3-30 GeV, 12:17105 (R;SU;In Russian)
NEUTRINO-NUCLEON INTERACTIONS
Study on the inclusive neutrino (antineutrino) interactions with nuclei at 3-30 GeV, 12:17105 (R;SU;In Russian)
NEUTRINOS
See also SOLAR NEUTRINOS
Astrophysics
Trends in physics 1984. Proceedings of the 6th general conference of the European Physical Society. Volume 1, 12:16944 (R;CS)
Galaxies
Neutrino masses and galaxy formation, 12:16953 (RA;CS)
NEUTRON ACTIVATION ANALYSIS
See ACTIVATION ANALYSIS
NEUTRON REACTIONS
NEUTRON BEAMS
Energy Spectra
Calculation of the energy spread and the average neutron energy of 14 MeV neutrons produced via the T(d,n)/sup 4/He reaction in solid Ti-T targets, 12:17312 (R;XA)
NEUTRON CAPTURE
See NEUTRON REACTIONS
NEUTRON DETECTION
Time-of-Flight Method
Progress in the detection of low energy neutrons, 12:16626 (RA;CS)
NEUTRON DETECTORS
See also ACTIVATION DETECTORS
Calibration
Calibration of neutron correlation counters by calorimetry and gamma-ray measurements, 12:16664 (J;US)
Field test and calibration of neutron coincidence counters for high-mass plutonium samples, 12:16647 (R;US)
Field Tests
Field test and calibration of neutron coincidence counters for high-mass plutonium samples, 12:16647 (R;US)
MeV Range 01-10
Progress in the detection of low energy neutrons, 12:16626 (RA;CS)
NEUTRON DIFFRACTOMETERS
Design
The Low-Q Diffractometer at the Los Alamos Neutron Scattering Center, 12:16648 (R;US)
On-Line Control Systems
Neutron diffractometer at the IBR-2 reactor. Control system for four-circle goniometer, 12:16484 (R;SU;In Russian)
NEUTRON DOSIMETRY
Monitoring radiation damage of reactor structural materials, 12:15949 (RA;CS;In Czech)
Personnel neutron dosimetry using CR-39 foils, 12:16879 (R;US)
Evaluation
Personnel neutron dosimeter evaluation and upgrade program, 12:16875 (RA;US)
Luminescent Dosemeters
Influence of different detector parameters on the neutron sensitivity of OSL-detectors, 12:16634 (R;SU)
Research Programs
Reactor physics (nuclear power plant design and operation) and in core dosimetry, 12:16620 (RA;CS;In Czech)
Sensitivity
Energy dependence of some neutron dosimeter sensitivities in the 1 eV up to 4 keV energy range, 12:16641 (R;SU;In Russian)
NEUTRON ECONOMY
See NEUTRON FLUX
NEUTRON FLUX
Monte Carlo Method
Fast neutron fluxes in pressure vessels using Monte Carlo methods, 12:15822 (J;US)
NEUTRON FLUX DENSITY
See NEUTRON FLUX
NEUTRON HEATING
See RADIATION HEATING
NEUTRON LEAKAGE
Neutron Spectra
Investigation of time evolution of leakage neutron spectra from the surface of a molybdenum sphere in the nanosecond range, 12:17309 (R;SU;In Russian)
NEUTRON MATTER
See NUCLEAR MATTER
NEUTRON MOISTURE METERS
See MOISTURE GAGES
NEUTRON MONITORS
On the possibility of using a neutron supermonitor in the ANI complex experiment, 12:16604 (R;SU;In Russian)
In Core Instruments
In core measurement and monitoring of reactor (neutron) radiation field, 12:16624 (RA;CS;In Czech)
NEUTRON REACTIONS
4th international symposium on neutron induced reactions. The abstracts of contributed papers, 12:17264 (R;CS)
Alpha Spectra
Structure effects in (n,α) reactions on Nd and Zr isotopes, 12:17228 (R;FR)
Capture
Neutron capture mechanism, 12:17276 (RA;CS)
Cross Sections
Measurement and evaluation of nuclear data for nuclear power application, 12:17244 (RA;CS)
Uncertainties in scientific measurements, 12:17216 (R;US)
Data Covariances
Covariances of evaluated nuclear data based upon uncertainty information of experimental data and nuclear models, 12:17192 (R;US)
Elastic Scattering
Neutron scattering on nuclei near A = 60 and A = 90, 12:17257 (R;US)
Energy-Level Density
Nuclear level density from analysis of neutron spectra from (n,n') and (p,n) reactions, 12:17277 (RA;CS)
Fission
/sup 235/U(n,f) fragment mass, kinetic energy and angular distributions at energies below 6 MeV - results and interpretation, 12:17246 (RA;CS)
Energy dependence peculiarities of fragment mean kinetic energy at nuclei fission by neutrons, 12:17248 (RA;CS)
Experimental study of γ-ray emission from neutron resonance fission of /sup 235/U, 12:17250 (RA;CS)
Shell effects in the spontaneous and thermal neutron induced fission of the plutonium isotopes, 12:17247 (RA;CS)
Thermal neutron fission cross-sections of /sup 236/Np isomers, 12:17249 (RA;CS)
Hauser-Feshbach Theory
Calculation of the reaction cross sections of neutrons on /sup 10/B, /sup 11/B by using optical model and Hauser-Feshbach theory, 12:17254 (R;CN;In Chinese)
Inelastic Scattering
Inelastic scattering cross-section of fast neutrons on 160, 162, 164 Dy, 12:17231 (RA;CS)
Measurement of inelastically scattering neutron spectra from the (n,n'γ) reaction on iron nuclei, 12:17213 (R;SU;In Russian)
Neutron scattering on light even-even nuclei, 12:17214 (RA;CS)
MeV Range 10-100
Proton-channel related analysis of 14 MeV (n,xn)-reactions, 12:17272 (RA;CS)
Multiplicity
Energy dependence of the neutron multiplicity P/sub nu/ in fast neutron induced fission of /sup 235,238/U and ^{239}Pu, 12:17239 (R;US)

Optical Models
Calculation of the reaction cross sections of neutrons on /sup 10/B, /sup 11/B by using optical model and Hauser-Feshbach theory, 12:17254 (R;CN;In Chinese)
Neutron scattering on nuclei near A = 60 and A = 90, 12:17257 (R;US)
Precompound-Nucleus Emission
Neutron-gamma coincidence calculations within the pre-equilibrium model, 12:17273 (RA;CS)
Protons
Analog giant dipole excitation in /sup 58/Ni(n,p)/sup 58/Co reaction at 17.3 MeV neutron energy, 12:17221 (RA;CS)
Research Programs
Progress report on nuclear data activities in India for the period from July 1984 to December 1985, 12:17191 (R;IN)
Scattering
Consideration of the (n,d) and (p,d) scattering and breakup reactions through singular integral equations, 12:17279 (RA;CS)
Three-Body Problem
Consideration of the (n,d) and (p,d) scattering and breakup reactions through singular integral equations, 12:17279 (RA;CS)

NEUTRON SOURCE FACILITIES
See also IPNS-I SYNCHROTRON
Neutron Beams
Calculation of the energy spread and the average neutron energy of 14 MeV neutrons produced via the T(d,n)/sup 4/He reaction in solid Ti-T targets, 12:17312 (R;XA)
Specifications
Intense neutron generator project at the Technical University Dresden, 12:16557 (RA;CS)
Recent developments in the multipurpose intense 14 MeV neutron source at Bratislava, 12:16509 (RA;CS)

NEUTRON SOURCES
Excludes reactors even when used as neutron sources.
Calibration
Californium-252 neutron calibration flux distribution by Monte Carlo simulation, 12:15579 (J;US)
Fabrication
TURF Californium facility at Oak Ridge National Laboratory, 12:15577 (J;US)

NEUTRON SPECTRA
Computer Calculations
Calculations of spatial and energy distribution of neutrons in reactor core and shielding. Part 2, 12:15927 (RA;CS;In Czech)
Neutron spectrum determination with activation detectors, 12:16623 (RA;CS;In Czech)
Standardization
Reactor physics (nuclear power plant design and operation) and in core dosimetry, 12:16620 (RA;CS;In Czech)

NEUTRON SPECTROMETERS
In Core Instruments
Assessment of in core dosimetry measuring systems, 12:16621 (RA;CS;In Czech)

NEUTRON SPECTROSCOPY
Activation Detectors
Neutron spectrum determination with activation detectors, 12:16623 (RA;CS;In Czech)
Proton Recoil Detectors
Proton-recoil neutron spectrometry, 12:16622 (RA;CS;In Czech)

NEUTRON STARS
X Radiation
Compact galactic X-ray sources, 12:16950 (RA;CS)

NEUTRON TRANSPORT
Boltzmann Equation
Calculations of spatial and energy distribution of neutrons in reactor core and shielding. Part 1, 12:15926 (RA;CS;In Czech)
Research Programs
The LBM program at the EPFL/LOTUS Facility, 12:17524 (J;US)

NEUTRON TRANSPORT THEORY
Algorithms
On the method of separation of regions in the framework of the neutron transport theory, 12:17310 (R;SU;In Russian)

NEUTRONS
See also RESONANCE NEUTRONS
THERMAL NEUTRONS
Dose Equivalents
Application of microdosimetry techniques in health physics, 12:17323 (RA;US)
Pair Production
Correlations between neutrons with small relative momenta produced in p-Pb interactions at 7,5 GeV/c, 12:17238 (R;SU)
Quality Factor
Application of microdosimetry techniques in health physics, 12:17323 (RA;US)

NEVADA
Geothermal Systems
Geologic and hydrologic research on the Moana geothermal system, Washoe County, Nevada, 12:15627 (J;US)

NEW ENGLAND
See FEDERAL REGION I

NEW MEXICO
Dolomite
Interpretation of the convergent-flow tracer tests conducted in the Culebra dolomite at the H-3 and H-4 hydropads at the Waste Isolation Pilot Plant (WIPP) site, 12:15449 (R;US)

NEW YORK
Acid Rain
Chemical composition of precipitation at Long Island, NY, 12:16732 (J;NL)
Fossil-Fuel Power Plants
Water and steam chemistry control experiences with fossil peaking units, 12:15733 (RA;US)
Lakes
A review of the chemical record in lake sediment of energy related air pollution and its effects on lakes, 12:16733 (J;NL)
Methanol Plants
Methanol production from indigenous resources in New York State, 12:15591 (R;US)
Methanol production from indigenous resources in New York State. Volume 1. Executive summary, 12:15592 (R;US)
Methanol production from indigenous resources in New York State. Volume 2. Technical and economic evaluation of conversion process plants, 12:15593 (R;US)
Methanol production from indigenous resources in New York State. Volume 3. Technical and economic evaluation of conversion process plants, 12:15594 (R;US)
Vehicles
Technology and market assessment of gas-fueled vehicles in New York State, 12:16229 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 1. Executive summary. Final report, 12:16230 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 2. Technology and economic assessment. Final report, 12:16231 (R;US)
Technology and market assessment of gas-fueled vehicles in New York State. Volume 3. Institutional barriers and market assessment. Final report, 12:16232 (R;US)

NEW ZEALAND
Biomass Plantations
Land suitability and availability for energy farming: a regional study Phase 2 report. Final report, 12:15609 (R;US)
Solar Water Heating
In-situ performance of solar water heaters: a testing programme. Final report, 12:15623 (R;US)

NEXT EUROPEAN TORUS
See NET TOKAMAK

NICKEL
Absorption Spectroscopy
Physical properties of oxide containing metal precipitates. Part II, 12:16344 (J;GB)
Crystal Defects
Physical properties of oxide containing metal precipitates. Part II, 12:16344 (J;GB)

Electrodeposition
Electroforming with nickel, iron, and aluminum, 12:16298 (R;US)
Electronic Structure
Angle-resolved photoemission extended fine structure, 12:16323 (BA;US)
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Geochemistry
Thermochemical study of the distribution of cobalt and nickel between diopsidic pyroxene and melt, 12:16931 (J;US)
Ion Implantation
Precipitation of Kr in Ni at room temperature, 12:16262 (R;US)
Mechanical Properties
Physical properties of oxide containing metal precipitates. Part II, 12:16344 (J;GB)
Microstructure
Physical properties of oxide containing metal precipitates. Part II, 12:16344 (J;GB)
Photoemission
Angle-resolved photoemission extended fine structure, 12:16323 (BA;US)
Physical Radiation Effects
Temperature-dose dependences of porosity parameters in nickel irradiated by 1 meV nitrogen ions, 12:16274 (R;SU;In Russian)
Trapping of deuterium in argon-implanted nickel, 12:16302 (J;US)
Superlattices
Elastic properties of superlattices (Nb/Cu; Au/Cr; Mo/Ni), 12:16260 (R;US)
Surface Properties
Modification of the properties of metal overlayers on Nb(110) and Ta(110), 12:16241 (R;US)
Trace Amounts
Physical properties of oxide containing metal precipitates. Part II, 12:16344 (J;GB)
X-Ray Spectra
Angle-resolved photoemission extended fine structure, 12:16323 (BA;US)

NICKEL 58 REACTIONS
Heavy Ion Fusion Reactions
Ground-state proton radioactivity in the region of neutron-deficient nuclei above the tin, 12:17229 (R;DE;In German)
Incomplete Fusion Reactions
Formation and decay of hot nuclei, 12:17241 (R;FR)

NICKEL 58 TARGET
Neutron Reactions
Analog giant dipole excitation in /sup 58/Ni(n,p)/sup 58/Co reaction at 17.3 MeV neutron energy, 12:17221 (RA;CS)
Nickel 58 Reactions
Ground-state proton radioactivity in the region of neutron-deficient nuclei above the tin, 12:17229 (R;DE;In German)

NICKEL 61 TARGET
Alpha Reactions
Application of hot spot conception to analysis of spectra from reactions with light bombarding nuclei, 12:17225 (R;SU;In Russian)

NICKEL 62 TARGET
Helium 3 Reactions
Application of hot spot conception to analysis of spectra from reactions with light bombarding nuclei, 12:17225 (R;SU;In Russian)

NICKEL ALLOYS
See also HASTELLOYS
INVAR
NICKEL BASE ALLOYS
Atom Transport
Diffusion and ion mixing in amorphous alloys, 12:16249 (R;US)
Energy Spectra
Performance of multilayer dispersion elements from 80 to 500 eV, 12:16324 (BA;US)
Physical Radiation Effects
Ion-induced spinodal-like decomposition of Fe-Ni-Cr Invar alloys, 12:16277 (R;US)
Reflectivity
Performance of multilayer dispersion elements from 80 to 500 eV, 12:16324 (BA;US)
Valence
Valence instabilities in amorphous rare earth compound films, 12:16303 (J;NL)

NICKEL BASE ALLOYS
See also INCONEL ALLOYS
Annealing
Annealing of cold worked hypostoichiometric Ni_3Al alloys using positron lifetime spectroscopy, 12:16240 (R;US)
Crystal Growth
Primary arm spacing in chill block melt spun Ni-Mo alloys, 12:16288 (R;US)
Ductility
Ductility and fracture behavior of polycrystalline Ni_3Al alloys, 12:16264 (R;US)
Fracture Properties
Ductility and fracture behavior of polycrystalline Ni_3Al alloys, 12:16264 (R;US)
Passivation
Passivity of amorphous Ni-Cr-P alloys, 12:16296 (R;US)
Physical Radiation Effects
Formation of submicron metastable phase structures in alloys with focused electron or proton beams (Ni-Al), 12:16261 (R;US)
Surface Treatments
Formation of submicron metastable phase structures in alloys with focused electron or proton beams (Ni-Al), 12:16261 (R;US)
Tensile Properties
Mechanical properties of various alloys in hydrogen. Final report, 12:16289 (R;US)

NICKEL COMPLEXES
Catalytic Effects
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)
Chemical Preparation
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)
Chemical Properties
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)

NICKEL IONS
Ion-Atom Collisions
Charge transfer in 1.4 MeV/u Ni/sup q+/ -> Kr collisions, q=16-22, 12:17071 (R;DE)

NICKEL OXIDES
Catalytic Effects
Steam gasification of carbonaceous solids catalyzed by a mixture of potassium and nickel oxides below 1000 K, 12:15297 (J;US)

NICKEL-IRON BATTERIES
See IRON-NICKEL BATTERIES

NINE MILE POINT-1 REACTOR
Scriba, New York, USA
Decontamination
Implication of remote technology for decontamination activities, 12:16011 (RA;US)

NIOBATES
Specific compounds should be indexed by coordination of a descriptor in the form (CATION) COMPOUNDS and the above anion descriptor.
Phase Transformations
The role of point defects on structural phase transitions: Progress report for the year 1986-1987 (Li-doped $KMnF_3$, $KZnF_3$; $K(Ta,Nb)O_3$), 12:16355 (R;US)

NIOBIUM
Crystal Defects
Dynamic processes when irradiating of solids, 12:17348 (R;SU;In Russian)
Vacancies in thermal equilibrium in Nb, 12:16308 (BA;US)

Crystal Structure
A positron annihilation doppler broadening study of niobium, 12:16309 (BA;US)
Physical Radiation Effects
A positron annihilation doppler broadening study of niobium, 12:16309 (BA;US)
Dynamic processes when irradiating of solids, 12:17348 (R;SU;In Russian)
Vacancies in thermal equilibrium in Nb, 12:16308 (BA;US)
Superlattices
Elastic properties of superlattices (Nb/Cu; Au/Cr; Mo/Ni), 12:16260 (R;US)
Surface Coating
Modification of the properties of metal overlayers on Nb(110) and Ta(110), 12:16241 (R;US)
Vacancies
A positron annihilation doppler broadening study of niobium, 12:16309 (BA;US)
Vacancies in thermal equilibrium in Nb, 12:16308 (BA;US)

NIOBIUM 93 TARGET
Neutron Reactions
Neutron scattering on nuclei near A = 60 and A = 90, 12:17257 (R;US)

NIOBIUM ALLOYS
See also INCONEL 600
INCONEL 718
Corrosion
Characteristics of corrosion behaviour of Zr 1% Nb WWER fuel claddings within 700 to 1000°C on long-term exposures, 12:15797 (R;SU)
Crystal Defects
Dynamic processes when irradiating of solids, 12:17348 (R;SU;In Russian)
Fuel Cans
Characteristics of corrosion behaviour of Zr 1% Nb WWER fuel claddings within 700 to 1000°C on long-term exposures, 12:15797 (R;SU)
Physical Radiation Effects
Dynamic processes when irradiating of solids, 12:17348 (R;SU;In Russian)

NIOBIUM OXIDES
Crystallography
The elastic properties of LaNbO/sub 4/, 12:16340 (BA;US)
Elasticity
The elastic properties of LaNbO/sub 4/, 12:16340 (BA;US)
Quantitative Chemical Analysis
Determination of Ti, Cr, Cu and Ta in niobium oxide by X-ray fluorescence method, 12:16381 (R;IN)

NITRIC ACID
Monitoring
Description of data on the Nimbus 7 LIMS map archive tape: ozone and nitric acid, 12:16707 (R;US)

NITRIC OXIDE
NO.
Control
Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln, 12:15314 (R;US)
Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln. Volume 1. Technical report. Final report, June 1983-September 1985, 12:15315 (R;US)
Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln. Volume 2. Data supplement A. Final report, June 1983-September 1985, 12:15316 (R;US)
Evaluation of primary air vitiation for nitric oxide reduction in a rotary cement kiln. Volume 3. Data supplement B. Final report, June 1983-September 1985, 12:15317 (R;US)

NITRILES
Chemical Reactions
Facile reductive cleavage of the C=O bond of acyl halides and the C identical with N bond of nitriles by hydrogen in the presence of sulfido-bridged molybdenum complexes, 12:16415 (J;US)

NITRO COMPOUNDS
Mutagenesis
Effects of highly aromatic complex chemical mixtures on the mutagenicity of amino-PAH, nitro-PAH and the intercalating agent, ICR191, 12:15343 (RA;US)

NITROGEN
Adsorption
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
Chemical Reaction Kinetics
Some safety considerations of liquid lithium as a fusion breeder material, 12:17549 (J;US)
Quantitative Chemical Analysis
Semi-microdetermination of nitrogen in actinide compounds by Dumas method, 12:16376 (R;IN)
Quantity Ratio
Organic storage of CO_2 on the continental slope off the mid-Atlantic bight, the southeastern Bering Sea, and the Peru coast, 12:16786 (J;GB)

NITROGEN COMPOUNDS
See also NITROGEN OXIDES
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Chemical Preparation
Formation of long carbon chain molecules during laser vaporization of graphite, 12:16424 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)

NITROGEN DIOXIDE
NO_2.
Monitoring
Combustion-torch ignition: Fluorescence imaging of NO/sub 2/, 12:15369 (BA;US)

NITROGEN NITRIDES
See NITROGEN

NITROGEN OXIDES
See also NITRIC OXIDE
NITROGEN DIOXIDE
NITROUS OXIDE
Air Pollution Control
Comprehensive report to Congress: Clean Coal Technology program: Tidd PFBC [pressurized fluidized-bed combustion] demonstration project, 12:15327 (R;US)
Chemical Reaction Yield
Experimental investigation of the formation of nitrogen oxides in combustion of coal dust. 2nd intermediate report covering the period from May 1, 1983 to June 30, 1984, 12:15329 (R;DE;In German)
Emission
Estimated monthly emissions of sulfur dioxide and oxides of nitrogen for the 48 contiguous states, 1975-1984: Volume 2, Supporting data bases and monthly SO_2 and NO/sub x/ estimates by state, 12:16770 (R;US)
Forecasting
Calculation of emission scenarios for passenger cars in the Netherlands, 12:16208 (R;NL;DU)
Monitoring
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species. Final report, period ending June 1986, 12:16706 (R;US)

NITROSAMINES
Carcinogen Screening
Tumor-promoting activity of complex organic mixtures, 12:15342 (RA;US)
Metabolism
Metabolism of chemical mixtures by the upper respiratory tract, 12:16889 (RA;US)
Toxicity
Metabolism of chemical mixtures by the upper respiratory tract, 12:16889 (RA;US)

NITROUS OXIDE
N_2O.
Ecological Concentration
Model study of the greenhouse effects due to increasing atmospheric CH_4, N_2O, CF_2Cl_2, and $CFCl_3$, 12:16760 (J;US)
Environmental Effects
Model study of the greenhouse effects due to increasing atmospheric CH_4, N_2O, CF_2Cl_2, and $CFCl_3$, 12:16760 (J;US)

NMR SPECTROMETERS
Coaxial Cables
Reaction of hybrid circuit on the magnetic flux perturbation, 12:16672 (R;SU;In Russian)
Superconducting Cables
Reaction of hybrid circuit on the magnetic flux perturbation, 12:16672 (R;SU;In Russian)
NOBLE GASES

PROTEINS

Biochemical Reaction Kinetics
In vivo interactions of chemical mixtures with DNA, 12:16897 (RA;US)

Carcinogen Screening
Action of tumor initiators and promoters in the Syrian hamster embryo cell transformation assay, 12:16902 (RA;US)

Carcinogenesis
Analysis of DNA adducts using trace organic analytical techniques, 12:16896 (RA;US)
Responses of the respiratory tract to inhaled particle-organic mixtures, 12:16893 (RA;US)

Catalytic Effects
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)

Chemical Preparation
σ bond metathesis for C-H bonds of hydrocarbons and Sc-R (R = H, alkyl, aryl) bonds of permethylscandocene derivatives. Evidence for noninvolvement of the π system in electrophilic activation of aromatic and vinylic C-H bonds, 12:16414 (J;US)
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)

Chemical Properties
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)

Chemical Reactions
σ bond metathesis for C-H bonds of hydrocarbons and Sc-R (R = H, alkyl, aryl) bonds of permethylscandocene derivatives. Evidence for noninvolvement of the π system in electrophilic activation of aromatic and vinylic C-H bonds, 12:16414 (J;US)

Crystal Lattices
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ (X^- = IBr_2^-, AuI_2^-, I_3^-) (ET = bis(ethylenedithio)tetrathiafulvalene), 12:16412 (J;US)

Ecological Concentration
Changes in soil carbon storage and associated properties with disturbance and recovery, 12:16778 (BA;US)

Electron-Phonon Coupling
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ (X^- = IBr_2^-, AuI_2^-, I_3^-) (ET = bis(ethylenedithio)tetrathiafulvalene), 12:16412 (J;US)

Metabolism
In vivo interactions of chemical mixtures with DNA, 12:16897 (RA;US)
Metabolism of chemical mixtures by the upper respiratory tract, 12:16889 (RA;US)
Separations and synthesis support of pharmacokinetic studies, 12:16887 (RA;US)

Mixtures
Separations and synthesis support of pharmacokinetic studies, 12:16887 (RA;US)

Molecular Structure
σ bond metathesis for C-H bonds of hydrocarbons and Sc-R (R = H, alkyl, aryl) bonds of permethylscandocene derivatives. Evidence for noninvolvement of the π system in electrophilic activation of aromatic and vinylic C-H bonds, 12:16414 (J;US)

Mutagen Screening
Comparative in vitro and in vivo models of cytotoxicity and genotoxicity, 12:16901 (RA;US)

Teratogenesis
Developmental effects in rats and mice after dermal exposure to a high-boiling complex organic mixture, 12:15337 (RA;US)

Toxicity
Developmental effects in rats and mice after dermal exposure to a high-boiling complex organic mixture, 12:15337 (RA;US)
Effects of complex organic mixtures of coal liquid on cardiovascular function, 12:15338 (RA;US)
Lifetime studies with mice after exposure to a high-boiling complex organic mixture, 12:15339 (RA;US)
Metabolism of chemical mixtures by the upper respiratory tract, 12:16889 (RA;US)

Transition Temperature
Importance of intermolecular hydrogen...hydrogen and hydrogen...anion contacts for the lattice softness, the electron-phonon coupling, and the superconducting transition temperatures, T/sub c/, of organic conducting salts β-$(ET)_2X$ (X^- = IBr_2^-, AuI_2^-, I_3^-) (ET = bis(ethylenedithio)tetrathiafulvalene), 12:16412 (J;US)

Volatile Matter
Report on the parallel ambient sampling project for selected organic toxics. Final report, 12:16722 (R;US)
Results of 1984 architectural coatings sales survey. Final report, 12:16727 (R;US)

Waste Disposal
Evaluation of potential mixed wastes containing lead, chromium, used oil, or organic liquids, 12:15439 (R;US)

ORGANIC IODINE COMPOUNDS

Chemical Preparation
Nuclear medicine: Progress report for quarter ending September 30, 1986, 12:16813 (R;US)

Tissue Distribution
Nuclear medicine: Progress report for quarter ending September 30, 1986, 12:16813 (R;US)

ORGANIC PHOSPHORUS COMPOUNDS
Excluding NUCLEIC ACIDS and NUCLEOTIDES.

Binding Energy
Ligand perturbation of the molecular and electronic structures of quadruply bonded dimers. The Crystal structures of $Mo_2Br_4(PMe_3)_4$ and $Mo_2I_4(PMe_3)_4$, and the vibrational and electronic spectra of a series of $M_2X_4L_4$ complexes, 12:16410 (J;US)

Crystal Structure
Ligand perturbation of the molecular and electronic structures of quadruply bonded dimers. The Crystal structures of $Mo_2Br_4(PMe_3)_4$ and $Mo_2I_4(PMe_3)_4$, and the vibrational and electronic spectra of a series of $M_2X_4L_4$ complexes, 12:16410 (J;US)

Electronic Structure
Ligand perturbation of the molecular and electronic structures of quadruply bonded dimers. The Crystal structures of $Mo_2Br_4(PMe_3)_4$ and $Mo_2I_4(PMe_3)_4$, and the vibrational and electronic spectra of a series of $M_2X_4L_4$ complexes, 12:16410 (J;US)

Vibrational States
Ligand perturbation of the molecular and electronic structures of quadruply bonded dimers. The Crystal structures of $Mo_2Br_4(PMe_3)_4$ and $Mo_2I_4(PMe_3)_4$, and the vibrational and electronic spectra of a series of $M_2X_4L_4$ complexes, 12:16410 (J;US)

ORGANIC POLYMERS
See also POLYAMIDES

POLYVINYLS
Absorption Spectra
Photophysical studies of triplet exciton processes in pure polymer films: Technical progress report for the period February 1985-July 26, 1986 (Poly (N-vinylcarbazole) (PVCA)), 12:16402 (R;US)
Photoluminescence
Photophysical studies of triplet exciton processes in pure polymer films: Technical progress report for the period February 1985-July 26, 1986 (Poly (N-vinylcarbazole) (PVCA)), 12:16402 (R;US)
ORGANIC SULFUR COMPOUNDS
Chemical Reactions
Synthesis of 1-(p-isothiocyanatobenzyl) derivatives of DTPA and EDTA. Antibody labeling and tumor-imaging studies, 12:16841 (J;US)
Labelling
Synthesis of 1-(p-isothiocyanatobenzyl) derivatives of DTPA and EDTA. Antibody labeling and tumor-imaging studies, 12:16841 (J;US)
Oxidation
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
Photochemical Reactions
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
ORGANIC WASTES

Realization of one algorithm for track elements isolation in analyzing the images of nuclear interactions, 12:16638 (R;SU;In Russian)
Microdosimetry
Measurement of energy deposition near heavy ion tracks, 12:17320 (RA;US)
PARTICLE-HOLE MODEL
Energy-Level Density
Particle-hole state densities for statistical multi-step compound reactions, 12:17268 (RA;CS)
PARTICULATES
Prior to September 1981, this concept was indexed to PARTICLES and AEROSOLS.
Adhesion
The mechanism of particulate adhesion in coal-fired gas turbine systems, 12:15679 (R;US)
Air Pollution Control
Identification, assessment, and control of fugitive particulate emissions, 12:16702 (RA;US)
Atmospheric Chemistry
Sensitivity analysis of RELMAP (Regional Lagrangian Model of Air Pollution) involving fine and coarse particulate matter, 12:16721 (R;US)
Combustion
Low-rank coal research: Quarterly technical progress report for the period April-June 1986, 12:15310 (R;US)
Single-particle combustion of Beulah lignite char, 12:15332 (BA;US)
Deposition
The mechanism of particulate adhesion in coal-fired gas turbine systems, 12:15679 (R;US)
Forecasting
Calculation of emission scenarios for passenger cars in the Netherlands, 12:16208 (R;NL;DU)
Removal
Demonstration, operation, and testing of a fabric filter on an industrial boiler for an extended period of time. Final report, March 1981-November 1982, 12:16717 (R;US)
PARTITION CHROMATOGRAPHY
See CHROMATOGRAPHY
PBFA
See PARTICLE BEAM FUSION ACCELERATOR
PCB
See CHLORINATED AROMATIC HYDROCARBONS
PEACH BOTTOM-2 REACTOR
York County, Pennsylvania, USA
Fuel Assemblies
Performance of boiling water reactor fuel lead test assemblies to 35 MWd/kg U, 12:15780 (J;US)
Reactor Core Disruption
Evolution of PRA methodology and insights since WASH-1400, 12:16085 (J;US)
Summary of core damage frequency from internal initiators: Peach Bottom, 12:16082 (J;US)
Risk Assessment
Evolution of PRA methodology and insights since WASH-1400, 12:16085 (J;US)
Smart approach to level-1 probabilistic risk assessment, 12:16080 (J;US)
Summary of core damage frequency from internal initiators: Peach Bottom, 12:16082 (J;US)
PEACH BOTTOM-3 REACTOR
York County, Pennsylvania, USA
Fuel Assemblies
Performance of boiling water reactor fuel lead test assemblies to 35 MWd/kg U, 12:15780 (J;US)
PEARL SPAR
See DOLOMITE
PEAT
Calorific Value
Recent developments in wet carbonization of peat, 12:15274 (R;US)
Carbonization
Recent developments in wet carbonization of peat, 12:15274 (R;US)
Waste Water
Recent developments in wet carbonization of peat, 12:15274 (R;US)
Water Removal
Recent developments in wet carbonization of peat, 12:15274 (R;US)
PELLETS (FUEL)
See FUEL PELLETS
PEOPLE
See HUMAN POPULATIONS
PEOPLES REPUBLIC OF CHINA
See CHINA

PEPTIDES
Electrophoresis
Two-dimensional peptide mapping of protease-digested proteins from two-dimensional electrophoresis gel spots, 12:16795 (R;US)
Extraction Chromatography
Two-dimensional peptide mapping of protease-digested proteins from two-dimensional electrophoresis gel spots, 12:16795 (R;US)
PERSONNEL
Studies of groups of persons employed in a particular field of endeavor. For studies on individuals in a group see also MAN.
See also REACTOR OPERATORS
Training
New approaches to performance-based project management training, 12:15922 (J;US)
Training requirements for health physicists in the decontamination/decommissioning field, 12:15536 (RA;US)
PERSONNEL DOSIMETRY
Personnel neutron dosimetry using CR-39 foils, 12:16879 (R;US)
Evaluation
Personnel neutron dosimeter evaluation and upgrade program, 12:16875 (RA;US)
Interlaboratory Comparisons
New dose quantities for personnel dosemeters. Results of the intercomparison program 1985 - seminar report, 12:16649 (R;DE;In German)
Recommendations
Technical guidelines for radiological calibrations, 12:16874 (RA;US)
Research Programs
Department of Energy Laboratory Accreditation program for occupational exposure measurements, 12:16877 (RA;US)
PERSONNEL FILM DOSIMETRY
See PERSONNEL DOSIMETRY
PERU
Carbon Cycle
Land use change and carbon exchange in the tropics. I. Detailed estimates for Costa Rice, Panama, Peru, and Bolivia, 12:16765 (J;US)
PETROLEUM
Limited to crude oil; see also COAL LIQUIDS, SHALE OIL, etc.
See also PETROLEUM FRACTIONS
Combustion Properties
Upgrading heavy feedstocks, 12:15361 (J;US)
Cost
Sensitivity analysis of ORION (Replacement cost of petroleum), 12:15362 (R;US)
Energy Models
Sensitivity analysis of ORION (Replacement cost of petroleum), 12:15362 (R;US)
Enhanced Recovery
Potential of enhanced oil recovery, 12:15357 (J;GB)
Market
World computer model of oil markets: OPEC pricing strategy model in the short and the long run, 12:16170 (R;DE)
Mathematical Models
World computer model of oil markets: OPEC pricing strategy model in the short and the long run, 12:16170 (R;DE)
Meetings
Petroleum and natural gas in the Nuclear Research Centre Juelich. Proceedings, 12:16159 (R;DE;In German)
Physical Properties
Upgrading heavy feedstocks, 12:15361 (J;US)
Prices
Sensitivity analysis of ORION (Replacement cost of petroleum), 12:15362 (R;US)
World computer model of oil markets: OPEC pricing strategy model in the short and the long run, 12:16170 (R;DE)
Refining
Upgrading heavy feedstocks, 12:15361 (J;US)
Research Programs
Petroleum and natural gas in the Nuclear Research Centre Juelich. Proceedings, 12:16159 (R;DE;In German)
Viscosity
Upgrading heavy feedstocks, 12:15361 (J;US)
PETROLEUM DEPOSITS
Energy Source Development
Proposed 5-year Outer Continental Shelf oil and gas leasing program, mid-1987 to mid-1992: Final environmental impact statement: Volume 1, 12:15363 (R;US)
Gamma Logging
Low radioactivity spectral gamma calibration facility, 12:15347 (BA;US)
Gamma-Gamma Logging
Calculation of gravimetric density caused by three-dimensional structure, 12:15348 (BA;US)
Geology
Cenozoic fluctuations in biotic parts of the global carbon cycle, 12:15351 (BA;US)
Simulation experiments with Late Quaternary carbon storage in mid-latitude forest communities, 12:15352 (BA;US)
Leasing
Proposed 5-year Outer Continental Shelf oil and gas leasing program, mid-1987 to mid-1992: Final environmental impact statement: Volume 1, 12:15363 (R;US)
Resistivity Logging
Evaluation and design of a large spacing loop-loop electromagnetic tool, 12:15349 (BA;US)
PETROLEUM FRACTIONS
See also PETROLEUM RESIDUES
Mutagen Screening
Complex mixtures: comparative chemical and toxicological characterization, 12:15336 (RA;US)
PETROLEUM INDUSTRY
Hazardous Materials
Waste/soil treatability studies for four complex industrial wastes: methodologies and results. Volume 1. Literature assessment, waste/soil characterization, loading-rate selection. Final report, 12:16221 (R;US)
Waste/soil treatability studies for four complex industrial wastes: methodologies and results. Volume 2. Waste loading impacts on soil degradation, transformation, and immobilization. Final report, 12:16222 (R;US)
PETROLEUM RESIDUES
B.P. over 1100°F, 593°C; includes oil residues, residua.
Carcinogen Screening
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Combustion Properties
Upgrading heavy feedstocks, 12:15361 (J;US)
Hydrogenation
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Mass Spectra
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Mixing
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Mutagen Screening
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
NMR Spectra
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Physical Properties
Upgrading heavy feedstocks, 12:15361 (J;US)
Processing
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Refining
Upgrading heavy feedstocks, 12:15361 (J;US)
PETTEN LOW FLUX REACTOR
See LFR REACTOR
PH VALUE
Effects of pH on calcium release from rod outer segment discs, 12:16797 (J;US)
PHANTOMS
Single Photon Emission Computed Tomography
A calibration phantom for absolute quantitation of radionuclide uptake by SPECT, 12:16819 (J;US)

Which collimator for SPECT with I-123 and CU-67, 12:16820 (J;US)

PHASE CHANGE MATERIALS
Use with the specific phase change material (e.g. calcium chloride) when known.
Computerized Simulation
PCMSOL: Simulation code for a passive solar structure incorporating phase change materials, 12:15622 (R;US)

PHENOL
Viscosity
Viscosity behavior in supercooled pure liquids and mixtures, 12:16407 (R;US)

PHENOLS
See also PHENOL
Biodegradation
Degradation of ortho phenol by streptomycetes in continuous cultures, 12:16828 (RA;US)
Biological Accumulation
Uptake and fate of xenobiotics in plants, 12:16891 (RA;US)
Catabolism
Degradation of ortho phenol by streptomycetes in continuous cultures, 12:16828 (RA;US)
Root Absorption
Uptake and fate of xenobiotics in plants, 12:16891 (RA;US)

PHENYLAMINE
See ANILINE

PHENYLETHYLENE
See STYRENE

PHORBOL ESTERS
Toxicity
Action of tumor initiators and promoters in the Syrian hamster embryo cell transformation assay, 12:16902 (RA;US)

PHOSPHATE MINERALS
Nuclear Reaction Analysis
Application of different methods of neutron activation analysis to the determination of trace elements in rock samples, 12:16391 (R;DE)

PHOSPHATES
For salts only; see also PHOSPHORIC ACID ESTERS.
Biological Accumulation
Investigations into the mechanisms of interaction between to microbial populations in activated sludge, 12:16837 (RA;US)
Oxidation
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
Photochemical Reactions
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)

PHOSPHORUS
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)

PHOSPHORUS 31
Diagnostic Uses
In vivo monitoring of line 168 mammary tumors by topical nuclear magnetic resonance, 12:16823 (J;US)

PHOSPHORUS 37
Half-Life
Application of the PFIS method to the LISE spectrometer at GANIL: (Experiment beta performed at the GANIL National Laboratory in Caen (France)) beta decay of light neutron rich exotic nuclei, 12:17217 (R;FR)

PHOSPHORUS 38
Half-Life
Application of the PFIS method to the LISE spectrometer at GANIL: (Experiment beta performed at the GANIL National Laboratory in Caen (France)) beta decay of light neutron rich exotic nuclei, 12:17217 (R;FR)

PHOSPHORUS ADDITIONS
Passivation
Passivity of amorphous Ni-Cr-P alloys, 12:16296 (R;US)

PHOSPHORUS COMPLEXES
Catalytic Effects
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)
Chemical Preparation
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)
Chemical Properties
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)

PHOSPHORUS COMPOUNDS
See also PHOSPHATES
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Fractionation
Thylakoid phosphoproteins, 12:15598 (R;US)

PHOTOCONDUCTORS
Testing
Characterization of on-chip polycrystalline silicon photoconductors, 12:16492 (R;US)
Uses
GaAs photoconductors to characterize picosecond response in GaAs integrated devices and circuits, 12:16491 (R;US)

PHOTODISINTEGRATION
See PHOTONUCLEAR REACTIONS

PHOTOELECTROCHEMICAL CELLS
Photoanodes
Superlattice photoelectrodes for photoelectrochemical cells, 12:15615 (P;US)
Photocathodes
Superlattice photoelectrodes for photoelectrochemical cells, 12:15615 (P;US)

PHOTOELECTRON SPECTROSCOPY
Uses
XPS [x-ray photoelectron spectroscopy], AES [Auger electron spectroscopy], RBS [Rutherford backscattering spectroscopy], NRA [nuclear reaction analysis] and laser Raman studies of high temperature corrosion, 12:16294 (R;US)

PHOTOLUMINESCENCE
Time Resolution
Streak camera and picosecond metrology of laser impulses running at high repetitive rates, 12:16602 (R;FR;In French)

PHOTOMAGNETIC EFFECT
See VISIBLE RADIATION

PHOTOMETERS
Design
Technology transfer of kinetic phosphorimetry, 12:16392 (RA;US)

PHOTOMULTIPLIERS
Hodoscopes
Hodoscope photomultipliers and their application in particle detectors, 12:16614 (R;SU;In Russian)

PHOTON ACTIVATION ANALYSIS
See ACTIVATION ANALYSIS, PHOTONS

PHOTON DETECTION (GAMMA)
See GAMMA DETECTION

PHOTON DETECTION (X-RAY)
See X-RAY DETECTION

PHOTON-NEUTRON INTERACTIONS
Photoproduction
Data compilation of single pion photoproduction below 2 GeV, 12:17113 (R;JP)

PHOTON-PROTON INTERACTIONS
Absorption
On the growth of hadronic photoabsorption cross-section, 12:17102 (R;SU)
Photoproduction
Data compilation of single pion photoproduction below 2 GeV, 12:17113 (R;JP)

Total Cross Sections
On the growth of hadronic photoabsorption cross-section, 12:17102 (R;SU)

PHOTONS
See also COSMIC PHOTONS
Multiple Production
Hadronic production of leptons and photons, 12:17137 (RA;CS)

PHOTONUCLEAR REACTIONS
Asymmetry
Experimental method for investigating γd->pn photodisintegration reaction on the linearly polarized photon beam of the Erevan synchrotron, 12:16547 (R;SU;In Russian)

PHOTOPRODUCTION
Pions
Data compilation of single pion photoproduction below 2 GeV, 12:17112 (R;JP)
Pions Minus
Data compilation of single pion photoproduction below 2 GeV, 12:17113 (R;JP)

PHOTOSPHERE
Magnetic Flux
Self-consistent models of solar photospheric magnetic flux concentrations, 12:16947 (RA;CS)

PHOTOSYNTHESIS
Remote Sensing
Relationship between atmospheric CO_2 variations and a satellite-derived vegetation index, 12:16736 (J;GB)
Seasonal Variations
Seasonal patterns of leaf photosynthetic capacity in successional northern hardwood tree species, 12:16805 (J;US)

PHOTOSYNTHETIC REACTION CENTERS
Messenger-RNA
Oxygen-regulated mRNAs for light-harvesting and reaction center complexes and for bacteriochlorophyll and carotenoid biosynthesis in Rhodobacter capsulatus during the shift from anaerobic to aerobic growth, 12:16796 (J;US)

PHOTOVOLTAIC POWER SUPPLIES
Computerized Simulation
PVFORM Version 3.2: a PV simulation program for mini and micro computer systems. Second version, 12:15617 (R;US)
Economic Analysis
Evaluation of international photovoltaic projects: Volume 1, Executive summary, 12:15616 (R;US)
Reviews
Evaluation of international photovoltaic projects: Volume 1, Executive summary, 12:15616 (R;US)

PHWR TYPE REACTORS
See also ATUCHA REACTOR
POINT LEPREAU-1 REACTOR
Neutron Diffusion Equation
BOXER3: a three dimensional integral transport code for PHWR supercell, 12:15837 (R;IN)

PHYCOBILISOMES
Chemical Composition
Constant phycobilisome size in chromatically adapted cells of the cyanobacterium Tolypothrix tenuis, and variation in Nostoc sp, 12:16806 (J;US)
Light intensity adaptation and phycobilisome composition of Microcystis aeruginosa, 12:16807 (J;US)
Molecular Structure
Light intensity adaptation and phycobilisome composition of Microcystis aeruginosa, 12:16807 (J;US)
Size
Constant phycobilisome size in chromatically adapted cells of the cyanobacterium Tolypothrix tenuis, and variation in Nostoc sp, 12:16806 (J;US)

PHYSICAL RADIATION EFFECTS
The role of energetic displacement cascades in ion beam modifications of materials, 12:16259 (R;US)
Reviews
Production of freely-migrating defects during irradiation, 12:16250 (R;US)

PHYSICS
See also ATOMIC PHYSICS
HIGH ENERGY PHYSICS
NUCLEAR PHYSICS

Synthesis
Sheath pigment formation in a blue-green algae lyngbya aestuarii as an adaptation to high light, 12:16832 (RA;US)

PIGS
See SWINE

PINES
Photosynthesis
Carbon dioxide exchange and growth of a pine plantation, 12:16809 (J;NL)
Plant Diseases
Incidence of fusiform rust infection on loblolly pine related to tip moth damage, 12:16886 (R;US)
Plant Growth
Carbon dioxide exchange and growth of a pine plantation, 12:16809 (J;NL)
Incidence of fusiform rust infection on loblolly pine related to tip moth damage, 12:16886 (R;US)

PINS (FUEL)
See FUEL PINS

PION MINUS REACTIONS
Isotope Effects
Isotope and isotonic effects in nucleon inclusive production at high energies (sup(6,7)Li, sup(10,11)B, sup(58,64)Ni, sup(112,124)Sn, Cu, Zn, In targets), 12:17198 (R;SU;In Russian)
Nuclear Reaction Yield
Isotope and isotonic effects in nucleon inclusive production at high energies (sup(6,7)Li, sup(10,11)B, sup(58,64)Ni, sup(112,124)Sn, Cu, Zn, In targets), 12:17198 (R;SU;In Russian)

PION MINUS-PROTON INTERACTIONS
Differential Cross Sections
Differential cross section of the π/sup -/p -> eta/sup 0/Δ/sup 0/(1232) reaction at the momentum of 3.3 Gev/s, 12:17149 (R;SU;In Russian)
Particle Production
Differential cross section of the π/sup -/p -> eta/sup 0/Δ/sup 0/(1232) reaction at the momentum of 3.3 Gev/s, 12:17149 (R;SU;In Russian)

PION PLUS REACTIONS
Inclusive Interactions
Observation of energetic protons in coincidence with pion-induced double charge exchange on /sup 12/C and /sup 48/Ca, 12:17212 (J;NL)
Knock-Out Reactions
Quasi-free scattering of pions on nuclei in the region of Δ/sub 33/-resonance, 12:17283 (RA;SU;In Russian)
Quasi-Free Reactions
Quasi-free scattering of pions on nuclei in the region of Δ/sub 33/-resonance, 12:17283 (RA;SU;In Russian)

PION REACTIONS
See also PION MINUS REACTIONS
PION PLUS REACTIONS

Potential Scattering
Dispersive effects in low energy pion-nucleus scattering, 12:17301 (J;NL)

PIONS
Multiplicity
Pion multiplicity in α-nucleus reactions from 200 to 800 A. MeV, 12:17205 (R;FR)
Photoproduction
Data compilation of single pion photoproduction below 2 GeV, 12:17112 (R;JP)

PIPELINES
Heat Losses
Simulation of heat losses and ground temperatures for district-heating culverts. Comparison with field experiments for well-insulated, damaged, and extra-insulated culverts, 12:16227 (R;US)
Hydrogen Embrittlement
Hydrogen degradation of pipeline steels: Final report, 12:16242 (R;US)
Materials Testing
Hydrogen degradation of pipeline steels: Final report, 12:16242 (R;US)

PIPES
Acoustic Emission Testing
Acoustic emission/flaw relationship for in-service monitoring of nuclear pressure vessels: Progress report, April 1986-September 1986, 12:15773 (R;US)
Cracks
BWR pipe crack remedies evaluation, 12:15764 (R;US)
Erosion
Pipe and bend erosion by pneumatic transport of solids at high temperature: Quarterly report, September-November 1986, 12:15324 (R;US)
In-Service Inspection
Acoustic emission/flaw relationship for in-service monitoring of nuclear pressure vessels: Progress report, April 1986-September 1986, 12:15773 (R;US)
Pressure Drop
Measurements of pressure drop in turbulent pipe flows of highly loaded HDPE slurries, 12:16200 (R;US)
Seismic Effects
Control calculations of seismic effects on pipes using integrated program package, 12:16055 (RA;CS;In Czech)
Systems Analysis
Application of the leak-before-break approach to BWR piping: Final report, 12:16029 (R;US)

PIXE ANALYSIS
Prior to October 1980, this concept was indexed to X-RAY EMISSION ANALYSIS.
Accuracy
Proton exciting X ray analysis. A new technique of trace element analysis in biomedicine, 12:16382 (R;CN;In Chinese)
Reviews
Status of data and data needs for XRF and PIXE based element analysis, 12:16377 (R;IN)
Sensitivity
Proton exciting X ray analysis. A new technique of trace element analysis in biomedicine, 12:16382 (R;CN;In Chinese)

PLACENTA
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)

PLANETARY ATMOSPHERES
Excludes EARTH ATMOSPHERE.
Infrared Spectra
Infrared observations of planetary atmospheres, 12:16985 (RA;US)
Planetary spectroscopy, 12:17005 (RA;US)
Particle Interactions
Secondary production of gamma rays in the Jovian magnetosphere, 12:16937 (RA;US)
Spectra
Planetary submillimeter spectroscopy, 12:16979 (RA;US)

PLANETARY NEBULAE
Expansion
On the mass loss rate by the nuclei of planetary nebulae, 12:16957 (R;SU;In Russian)

PLANETS

PLASMA
See also COLD PLASMA
COLLISIONAL PLASMA
EQUILIBRIUM PLASMA
LASER-PRODUCED PLASMA
Electron Beams
Collective excitation of a target by high-density electron beam, 12:17308 (R;SU;In Russian)
Line Broadening
Spectral line shapes of X-ray dipoler emission in high densities plasmas, 12:17062 (R;FR)
Research Programs
Space plasma research. Final report, August 1980-August 1986, 12:17413 (R;US)
Thermal Conductivity
Short-wave convective turbulence and anomalous electron thermal conductivity of a plasma, 12:17409 (R;SU)
Turbulence
Short-wave convective turbulence and anomalous electron thermal conductivity of a plasma, 12:17409 (R;SU)

PLASMA ACCELERATORS
See PLASMA GUNS

PLASMA DIAGNOSTICS
High power, millimeter-wavelength, coherent radiation sources. Final report, 1 February 1982-31 January 1986, 12:16487 (R;US)
Calibration
Pulsed soft X-ray source for laser plasma diagnostics calibrations, 12:17397 (R;FR)
Laser Radiation
Plasma diagnostics: Detection of laser scattering: Final report, September 1, 1978 to August 31, 1982, 12:17400 (R;US)
Neodymium Lasers
Nd:Glass lasers for Thomson scattering plasma diagnostics on the compact toroid transport experiment, 12:17422 (BA;US)
Probes
Neutral beam probe for potential measurements in Phaedrus minimum-B end plug, 12:17421 (BA;US)

Soft X Radiation
Pulsed soft X-ray source for laser plasma diagnostics calibrations, 12:17397 (R;FR)
Thomson Scattering
Nd:Glass lasers for Thomson scattering plasma diagnostics on the compact toroid transport experiment, 12:17422 (BA;US)
PLASMA FOCUS DEVICES
Modifications
Pulsed soft X-ray source for laser plasma diagnostics calibrations, 12:17397 (R;FR)
PLASMA GUNS
Design
Acceleration of compact torus plasma rings in a coaxial rail-gun, 12:17482 (RA;US)
PLASMA HEATING
Tearing Instability
Coronal heating by magnetic tearing turbulence, 12:16948 (RA;CS)
PLASMA MACROINSTABILITIES
See also TEARING INSTABILITY
Astrophysics
Magnetic reconnection in astrophysics, 12:16945 (RA;CS)
PLASMA OSCILLATIONS
See PLASMA WAVES
PLASMA (QUARK)
See QUARK MATTER
PLASMA RINGS
Acceleration
Acceleration of compact torus plasma rings in a coaxial rail-gun, 12:17482 (RA;US)
Performance
Ion ring experiments with applications to the compact toroid program, 12:17480 (RA;US)
PLASMA SWITCHES
Computerized Simulation
Computational modeling of plasma-flow switched foil implosions, 12:16496 (BA;US)
PLASMA WAVES
Mathematical Models
High-frequency broadband emission from turbulent plasmas, 12:17424 (BA;US)
PLASTIC SCINTILLATION COUNTERS
See PLASTIC SCINTILLATION DETECTORS
PLASTIC SCINTILLATION DETECTORS
Pulse Rise Time
Study of light pulse shape from polystyrene scintillators, 12:16615 (R;SU;In Russian)
PLATINUM
Heating
Pt-Ti alloy formation from high-temperature reduction of a titania-impregnated Pt catalyst: implications for strong metal-support interaction, 12:16300 (J;US)
Ion Beam Injection
Surface modification of solids, 12:16317 (BA;US)
Laser Beam Machining
Surface modification of solids, 12:16317 (BA;US)
Reduction
Pt-Ti alloy formation from high-temperature reduction of a titania-impregnated Pt catalyst: implications for strong metal-support interaction, 12:16300 (J;US)
Surface Properties
Modification of the properties of metal overlayers on Nb(110) and Ta(110), 12:16241 (R;US)
Surface Treatments
Surface modification of solids, 12:16317 (BA;US)
PLATINUM ALLOYS
Phase Studies
Pt-Ti alloy formation from high-temperature reduction of a titania-impregnated Pt catalyst: implications for strong metal-support interaction, 12:16300 (J;US)
PLATINUM COMPLEXES
Catalytic Effects
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)
Chemical Preparation
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)
Synthesis, characterization, and reactivity of α-ketoacyl complexes of platinum(II) and palladium(II). Crystal structures of trans-$Pt(PPh_3)_2(Cl)(COCOPh)$ and cis-$Pt(PPh_3)_2(COPh)(COOMe)$, 12:16413 (J;US)
Chemical Properties
Mediated electrochemical reduction of CO_2. Preparation and comparison of an isoelectronic series of complexes, 12:16421 (J;US)
Synthesis, characterization, and reactivity of α-ketoacyl complexes of platinum(II) and palladium(II). Crystal structures of trans-$Pt(PPh_3)_2(Cl)(COCOPh)$ and cis-$Pt(PPh_3)_2(COPh)(COOMe)$, 12:16413 (J;US)
Chemical Reactions
Synthesis, characterization, and reactivity of α-ketoacyl complexes of platinum(II) and palladium(II). Crystal structures of trans-$Pt(PPh_3)_2(Cl)(COCOPh)$ and cis-$Pt(PPh_3)_2(COPh)(COOMe)$, 12:16413 (J;US)
Crystal Structure
Synthesis, characterization, and reactivity of α-ketoacyl complexes of platinum(II) and palladium(II). Crystal structures of trans-$Pt(PPh_3)_2(Cl)(COCOPh)$ and cis-$Pt(PPh_3)_2(COPh)(COOMe)$, 12:16413 (J;US)
Oxidation
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
Photochemical Reactions
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
PLATINUM ISOTOPES
Rotational States
High-spin states and coexisting states in the Pt-Au transition region, 12:17235 (R;US)
PLOWSHARE PROJECT
Political Aspects
Nuclear explosives for peaceful purposes, 12:16683 (R;US)
PLUMES
Mathematical Models
An integral model of plume rise from high explosive detonations, 12:16679 (R;US)
PLUTO PLANET
Eclipse
Continued program of planetary study at the University of Texas McDonald Observatory, 12:16988 (RA;US)
Interferometry
Speckle interferometry applied to asteroids and other solar system objects, 12:17004 (RA;US)
Satellites
Research in planetary astronomy and operation of the 2.2-meter telescope, 12:16976 (RA;US)
Sodium
Planetary Fabry-Perot spectroscopy, 12:16992 (RA;US)
PLUTONIUM
Electrorefining
The application of electrorefining for recovery and purification of fuel discharged from the Integral Fast Reactor, 12:15383 (R;US)
Hydrolysis
Chemical behaviour of plutonium in natural aquatic systems: Hydrolysis, carbonate complexation and redox reactions, 12:16431 (R;DE;In German)
Nuclear Fuels
Interfacing robotics with plutonium fuel fabrication, 12:15377 (R;US)
Recovery
Interfacing solvent extraction in the recovery of pyrochemical residues at the Savannah River Plant, 12:15387 (R;US)
X-Ray Fluorescence Analysis
Online plutonium x-ray fluorescence analyzer system in F-Canyon, 12:15376 (R;US)

PLUTONIUM 238
Spontaneous Fission
Shell effects in the spontaneous and thermal neutron induced fission of the plutonium isotopes, 12:17247 (RA;CS)
PLUTONIUM 239
Half-Life
Uncertainties in scientific measurements, 12:17216 (R;US)
Ion Exchange
Recovery of /sup 238/Pu from irradiated /sup 237/Np using anion exchange method, 12:15381 (R;CN;In Chinese)
Mass Spectroscopy
Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique, 12:16375 (R;IN)
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
PLUTONIUM 239 TARGET
Neutron Reactions
Energy dependence of the neutron multiplicity P/sub nu/ in fast neutron induced fission of /sup 235,238/U and ^{239}Pu, 12:17239 (R;US)
Shell effects in the spontaneous and thermal neutron induced fission of the plutonium isotopes, 12:17247 (RA;CS)
Uncertainties in scientific measurements, 12:17216 (R;US)
PLUTONIUM 240
Mass Spectroscopy
Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique, 12:16375 (R;IN)
Spontaneous Fission
Shell effects in the spontaneous and thermal neutron induced fission of the plutonium isotopes, 12:17247 (RA;CS)
PLUTONIUM 241
Mass Spectroscopy
Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique, 12:16375 (R;IN)
PLUTONIUM 241 TARGET
Neutron Reactions
Shell effects in the spontaneous and thermal neutron induced fission of the plutonium isotopes, 12:17247 (RA;CS)
PLUTONIUM 242
Mass Spectroscopy
Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique, 12:16375 (R;IN)
Spontaneous Fission
Shell effects in the spontaneous and thermal neutron induced fission of the plutonium isotopes, 12:17247 (RA;CS)
PLUTONIUM 244
Spontaneous Fission
Shell effects in the spontaneous and thermal neutron induced fission of the plutonium isotopes, 12:17247 (RA;CS)
PLUTONIUM ALLOYS
Electronic Structure
Magnetization density of 5 f electrons in ferromagnetic PuSb, 12:16313 (J;US)
Magnetization
Magnetization density of 5 f electrons in ferromagnetic PuSb, 12:16313 (J;US)
PLUTONIUM COMPLEXES
Chemical Reaction Yield
Chemical behaviour of plutonium in natural aquatic systems: Hydrolysis, carbonate complexation and redox reactions, 12:16431 (R;DE;In German)
PLUTONIUM COMPOUNDS
See also PLUTONIUM OXIDES
Absorption Spectroscopy
Laser Induced Photoacoustic Spectroscopy for the oxidation specific determination of actinoids in solution, 12:16388 (R;FR;In German)
Solubility
Chemical behaviour of plutonium in natural aquatic systems: Hydrolysis, carbonate complexation and redox reactions, 12:16431 (R;DE;In German)
PLUTONIUM DIOXIDE
Chemical Properties
Chemical behaviour of Np, Pu and Am in various concentrated salt solutions, 12:16429 (R;FR;In German)
Removal
Experimental study of the recovery of plutonium from non-combustible wastes, 12:15429 (R;FR)
PLUTONIUM OXIDES
See also PLUTONIUM DIOXIDE
Multi-Element Analysis
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
PNA
See POLYCYCLIC AROMATIC HYDROCARBONS
PNEUMATIC TRANSPORT
Test Facilities
Advanced research in instrumentation and control technology: Multiphase flow studies, 12:15323 (R;US)
Advanced research in instrumentation and control technology: Capacitance flowmeter, 12:15273 (R;US)
Pipe and bend erosion by pneumatic transport of solids at high temperature: Quarterly report, September-November 1986, 12:15324 (R;US)
PNL
See BATTELLE PACIFIC NORTHWEST LABORATORIES
POINT CONTACTS
See ELECTRIC CONTACTS
POINT LEPREAU-1 REACTOR
St. John, New Brunswick, Canada
Planning
Financial risk assessment for nuclear generation expansion planning. A utility view, 12:15839 (RA;XA)
Risk Assessment
Financial risk assessment for nuclear generation expansion planning. A utility view, 12:15839 (RA;XA)
POISONS (CHEMICAL)
See HAZARDOUS MATERIALS
POLARIMETERS
On-Line Measurement Systems
Measuring module of an apparatus for polarization analysis of ultracold neutrons on the base of microcomputer, 12:16639 (R;SU;In Russian)
POLARIZED TARGETS
Development of a polarized deuterium target by spin exchange with optically pumped K, 12:16540 (R;US)
Design
Nuclear physics with internal targets in electron storage rings, 12:17203 (R;US)
Fabrication
Thin film coatings which inhibit spin relaxation of polarized potassium atoms, 12:16538 (R;US)
POLICY
See ENERGY POLICY
ENVIRONMENTAL POLICY
POLLUTANTS
Not for radioactive contaminants for which use RADIOACTIVE WASTES or other related terminology.
Environmental Effects
The combined effects of atmospheric deposition, internal acid production, and harvesting on nutrient gains and losses from forest ecosystems, 12:16781 (BA;US)
Environmental Transport
The combined effects of atmospheric deposition, internal acid production, and harvesting on nutrient gains and losses from forest ecosystems, 12:16781 (BA;US)
POLLUTION CONTROL EQUIPMENT
See also BAGHOUSES
ELECTROSTATIC PRECIPITATORS
Calculation Methods
Process fugitive particulates - design methods for enclosures, 12:16703 (RA;US)
Cost
Identification, assessment, and control of fugitive particulate emissions, 12:16702 (RA;US)

Design
Process fugitive particulates - design methods for enclosures, 12:16703 (RA;US)
Recommendations
Identification, assessment, and control of fugitive particulate emissions, 12:16702 (RA;US)
POLOIDAL DIVERTORS
See POLOIDAL FIELD DIVERTORS
POLOIDAL FIELD DIVERTORS
Design
PF coil system comparisons for a compact ignition device, 12:17536 (J;US)
POLONIUM 210
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
POLYACRYLONITRILE
See NITRILES
ORGANIC POLYMERS
POLYAMIDES
Hydraulic Conductivity
Viscoelastic behavior of hydrolyzed polyacrylamide solutions in porous media: Some preliminary observations, 12:15358 (BA;US)
Rheology
Viscoelastic behavior of hydrolyzed polyacrylamide solutions in porous media: Some preliminary observations, 12:15358 (BA;US)
Rock-Fluid Interactions
Viscoelastic behavior of hydrolyzed polyacrylamide solutions in porous media: Some preliminary observations, 12:15358 (BA;US)
POLYCRYSTALS
See also BICRYSTALS
Neutron Diffraction
Application of neutron time-of-flight diffraction to texture studies, 12:16280 (R;SU)
Texture
Application of neutron time-of-flight diffraction to texture studies, 12:16280 (R;SU)
POLYCYCLIC AROMATIC HYDROCARBONS
Biodegradation
Is the ability of microorganisms to degrade polycyclic aromatic hydrocarbons plasmid mediated?, 12:16831 (RA;US)
Carcinogen Screening
Initiation-promotion studies with complex mixtures, 12:15341 (RA;US)
Carcinogenesis
Factors affecting the carcinogenicity of inhaled particle-organic mixtures, 12:16894 (RA;US)
Metabolism of polycyclic aromatic hydrocarbons in coal-derived complex mixtures applied to mouse skin, 12:15335 (RA;US)
Gas Chromatography
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Hydrogenation
Determination of chemical properties and toxicologic activity of hydroaromatic species in coal liquefaction products, 12:15292 (RA;US)
Infrared Spectra
Infrared absorption and emission characteristics of interstellar PAHs [Polycyclic Aromatic Hydrocarbon], 12:16941 (R;US)
Laser Spectroscopy
Laser analysis of directly injected supercritical fluids, 12:16394 (RA;US)
Metabolism
Factors affecting the carcinogenicity of inhaled particle-organic mixtures, 12:16894 (RA;US)
Metabolism of polycyclic aromatic hydrocarbons in coal-derived complex mixtures applied to mouse skin, 12:15335 (RA;US)
Metabolism of chemical mixtures by the lower respiratory tract, 12:16890 (RA;US)
Mutagen Screening
Genotoxic effects of binary mixtures of polycyclic aromatic hydrocarbons, 12:16899 (RA;US)
Petroleum resid/coal co-processing feeds and product streams: Chemical and toxicological analysis, 12:15295 (R;US)
Mutagenesis
Effects of highly aromatic complex chemical mixtures on the mutagenicity of amino-PAH, nitro-PAH and the intercalating agent, ICR191, 12:15343 (RA;US)
Personnel Dosimetry
Monitoring exposure to polynuclear aromatic compounds via room temperature phosphorescence from solid substrates, 12:15345 (J;GB)
Phosphorescence
Monitoring exposure to polynuclear aromatic compounds via room temperature phosphorescence from solid substrates, 12:15345 (J;GB)
Resonance Ionization Mass Spectroscopy
Laser analysis of directly injected supercritical fluids, 12:16394 (RA;US)
Toxicity
Metabolism of chemical mixtures by the lower respiratory tract, 12:16890 (RA;US)

POROSIMETERS
Diffusion of gases in New Mexico coals: Final technical report, 12:15305 (R;US)
PORTLAND CEMENT
Leaching
Relationship between leaching of trace elements (Cs, Sr and Co) and microstructure during aging of a mortar with a matrix of artificial Portland cement, 12:16350 (R;FR;In French)

Microstructure
Relationship between leaching of trace elements (Cs, Sr and Co) and microstructure during aging of a mortar with a matrix of artificial Portland cement, 12:16350 (R;FR;In French)

POSITION SENSITIVE DETECTORS
Multiwire Proportional Chambers
X-ray position detection in the region of 6 μm RMS with wire proportional chambers, 12:16652 (J;NL)
Si Semiconductor Detectors
Detection of charged particles in amorphous silicon layers, 12:16655 (J;NL)
Performance of a novel silicon detector, 12:16660 (J;NL)

POSITRON BEAMS
Beam Transport
High intensity positron beam and angular correlation experiments at Livermore, 12:16312 (BA;US)

POSITRONIUM
High intensity positron beam and angular correlation experiments at Livermore, 12:16312 (BA;US)
Beam Production
Relativistic positronium channel at the IHEP accelerator, 12:16555 (R;SU;In Russian)
Resonance
Scalar magnetic (e/sup +/e/sup -/) resonance as possible source of an anomalous e/sup +/ peak in heavy-ion collisions, 12:17084 (J;NL)

POSITRONS
Annihilation
A positron annihilation doppler broadening study of niobium, 12:16309 (BA;US)
A study of the equilibrium vacancy ensemble in aluminum using 1D- and 2D-angular correlation of annihilation radiation, 12:16307 (BA;US)
Methane-bubble formation in hydrogen-charged Fe-30 ppm C, 12:16311 (BA;US)
PAS determination of the vacancy formation enthalpy in tungsten, 12:16310 (BA;US)
Vacancies in thermal equilibrium in Nb, 12:16308 (BA;US)
Diffusion
Vacancies in thermal equilibrium in Nb, 12:16308 (BA;US)
Trapping
A positron annihilation doppler broadening study of niobium, 12:16309 (BA;US)
A study of the equilibrium vacancy ensemble in aluminum using 1D- and 2D-angular correlation of annihilation radiation, 12:16307 (BA;US)
Methane-bubble formation in hydrogen-charged Fe-30 ppm C, 12:16311 (BA;US)
PAS determination of the vacancy formation enthalpy in tungsten, 12:16310 (BA;US)
Vacancies in thermal equilibrium in Nb, 12:16308 (BA;US)

POSTULATED PARTICLES

PROTON BEAMS
Acceleration
Two-stage acceleration system of high intensity proton beam up to energy of 1 GeV using U-240 isochronous cyclotron, 12:16512 (R;SU;In Russian)

Beam Extraction
High-intensity proton beam formed onto internal target of the IHEP accelerator, 12:16553 (R;SU;In Russian)
Beam Monitoring
On the proton beam characteristic detection in a cyclotron on multiple beam passage through a target, 12:16558 (RA;SU;In Russian)

PROTON REACTIONS
Cross Sections
Noneikonal effects in cross sections of proton reactions on nuclei, 12:17282 (RA;SU;In Russian)
Energy-Level Density
Nuclear level density from analysis of neutron spectra from (n,n') and (p,n) reactions, 12:17277 (RA;CS)
Inelastic Scattering
Random phase approximation, 12:17286 (R;FR)
Isotope Effects
Isotope and isotonic effects in nucleon inclusive production at high energies (sup(6,7)Li, sup(10,11)B, sup(58,64)Ni, sup(112,124)Sn, Cu, Zn, In targets), 12:17198 (R;SU;In Russian)
Nuclear Fireball Model
Excitation of target residues in the firestreak model, 12:17289 (R;SU)
Nuclear Reaction Yield
Excitation of target residues in the firestreak model, 12:17289 (R;SU)
Inclusive cross sections of π/sup +/, p, /sup 2/H, /sup 3/H, /sup 3/He yields at angle 3.5 deg in 6.37 and 8.08 GeV/c proton interactions with Be, Al, Cu, Ta nuclei, 12:17197 (R;SU;In Russian)
Isotope and isotonic effects in nucleon inclusive production at high energies (sup(6,7)Li, sup(10,11)B, sup(58,64)Ni, sup(112,124)Sn, Cu, Zn, In targets), 12:17198 (R;SU;In Russian)
Scattering
Consideration of the (n,d) and (p,d) scattering and breakup reactions through singular integral equations, 12:17279 (RA;CS)
Semiclassical Approximation
Random phase approximation, 12:17286 (R;FR)
Three-Body Problem
Consideration of the (n,d) and (p,d) scattering and breakup reactions through singular integral equations, 12:17279 (RA;CS)

PROTON-ANTIPROTON INTERACTIONS
Differential Cross Sections
Analysis of elastic scattering in anti pp interactions at 22.4 GeV/c, 12:17117 (R;SU;In Russian)
Elastic Scattering
Analysis of elastic scattering in anti pp interactions at 22.4 GeV/c, 12:17117 (R;SU;In Russian)
Jets
High transverse-momentum jets, 12:17136 (RA;CS)
Particle Production
Hyperon-antihyperon production studies near threshold at LEAR, 12:17098 (R;US)

PROTON-INDUCED X-RAY EMISSION ANALYSIS

Proceedings: 1985 international conference on coal science, 12:15267 (B;AU)
Yields
Expansion of high-temperature; high-pressure data set for coal gasification. Fourth quarterly report, June 28-September 28, 1985, 12:15278 (R;US)

PYROLYSIS PRODUCTS
See also CHARS
Gas Chromatography
Off-gas chemistry study of melter feed by Springborn Laboratories, 12:15425 (R;US)
Mass Spectroscopy
Off-gas chemistry study of melter feed by Springborn Laboratories, 12:15425 (R;US)

PYROXENES
See also DIOPSIDE
Cobalt
Thermochemical study of the distribution of cobalt and nickel between diopsidic pyroxene and melt, 12:16931 (J;US)
Nickel
Thermochemical study of the distribution of cobalt and nickel between diopsidic pyroxene and melt, 12:16931 (J;US)

PZT
Deposition
Effects of hydrolysis on metallo-organic solution deposition of PZT [lead zirconate titanate] films, 12:16347 (R;US)

Q

QINSHAN REACTOR
Near Shanghai, China.
Construction
Background for and experience with Qinshan project in China, 12:15874 (RA;XA)
Planning
Background for and experience with Qinshan project in China, 12:15874 (RA;XA)

QUADRUPOLE LINACS
Electromagnetic Fields
Systematic errors in field measurements in a hf quadrupole focusing accelerator, 12:16524 (R;SU;In Russian)

QUANTUM CHROMODYNAMICS
Bag Model
Is it necessary to prove the "potential" confinement in QCD, 12:17174 (R;SU;In Russian)
Chiral Symmetry
More on the first order chiral symmetry transition in QCD, 12:17160 (R;US)
Hard Collision Models
QCD and hard quark and gluon scattering, 12:17138 (RA;CS)
Infrared Divergences
Infrared asymptotics of perturbative QCD. Renormalization properties of the Wilson loops in higher orders of perturbation theory, 12:17170 (R;SU)

Instantons
Multiinstantons and monopoles in SU(2) gluodynamics, 12:17166 (R;SU)
Magnetic Moments
Tests of QCD in high energy spin reactions, 12:17123 (R;US)
Magnetic Monopoles
Multiinstantons and monopoles in SU(2) gluodynamics, 12:17166 (R;SU)
Monte Carlo Method
Solving QCD using Monte Carlo Renormalization Group method, 12:17182 (R;US)
Renormalization
Solving QCD using Monte Carlo Renormalization Group method, 12:17182 (R;US)
Spin Flip
Tests of QCD in high energy spin reactions, 12:17123 (R;US)
Supersymmetry
Gluon bremsstrahlung in supersymmetric QCD, 12:17148 (R;SU;In Russian)
Wilson Loop
Infrared asymptotics of perturbative QCD. Renormalization properties of the Wilson loops in higher orders of perturbation theory, 12:17170 (R;SU)

QUANTUM ELECTRODYNAMICS
Space Charge
Relativistic theory of forming space charge laminar flows, 12:17178 (R;SU;In Russian)

QUANTUM FIELD THEORY
See also LATTICE FIELD THEORY
QUANTUM CHROMODYNAMICS
QUANTUM ELECTRODYNAMICS
QUANTUM GRAVITY
Conformal Invariance
Energy-momentum tensor on a Riemann surface, 12:17183 (J;NL)
Energy-Momentum Tensor
Energy-momentum tensor on a Riemann surface, 12:17183 (J;NL)
Fock Representation
Fock representation for quaternion fields, 12:17173 (R;SU;In Russian)
Renormalization
Quantum field theory renormalization in curved space-time and renormalization group equations, 12:17167 (R;SU;In Russian)
Quantum principles in field interactions, 12:17172 (R;SU;In Russian)
Supermultiplets
On the anomalous supermultiplet in th Wess-Zumino model, 12:17164 (R;SU;In Russian)
Supersymmetry
On the anomalous supermultiplet in th Wess-Zumino model, 12:17164 (R;SU;In Russian)
Quantum principles in field interactions, 12:17172 (R;SU;In Russian)

QUANTUM GRAVITY
Gravitational Waves
Propagator of quantum gravity in minisuperspace, 12:17387 (R;DK)

QUANTUM MECHANICS
Algebra
Higher hypercomplex numbers and quantum mechanics, 12:17373 (R;SU)
Bethe-Salpeter Equation
Connection of two-particle relativistic quantum mechanics with the Bethe-Salpeter equation, 12:17142 (R;FR)
Fermions
Fock representation for quaternion fields, 12:17173 (R;SU;In Russian)

QUARK MATERIAL
See QUARK MATTER

QUARK MATTER
Heavy ion collisions, the quark-gluon plasma and antinucleon annihilation, 12:17125 (R;IN)
Astrophysics
Aborigines of the nuclear desert, 12:16952 (RA;CS)
Correlation Functions
Statistical methods of the description of quark degrees of freedom, 12:17294 (R;SU;In Russian)

QUARK MODEL
See also FLAVOR MODEL
STRING MODELS
Nucleon-Nucleon Interactions
Nucleon-nucleon scattering in a nonrelativistic quark model, 12:17133 (R;DE;In German)
Scalar Fields
Model of nonrelativistic quarks in self-consistent field, 12:17130 (R;SU;In Russian)

QUARK PLASMA
See QUARK MATTER

QUARK SEA
See QUARK MATTER

QUARK-ANTIQUARK INTERACTIONS
Cross Sections
Gluon bremsstrahlung in supersymmetric QCD, 12:17148 (R;SU;In Russian)

QUARK-GLUON PLASMA
See QUARK MATTER

QUARKONIUM
A hypothetical bound state of quark and antiquark.
Quarkonia, 12:17111 (RA;CS)
Hadronic Particle Decay
On the question of Higgs boson production in heavy quarkonium decays, 12:17129 (R;SU)
Radiative Decay
On the question of Higgs boson production in heavy quarkonium decays, 12:17129 (R;SU)

QUARK-QUARK INTERACTIONS
Cross Sections
Gluon bremsstrahlung in supersymmetric QCD, 12:17148 (R;SU;In Russian)

QUARKS
Pair Production
Gluon bremsstrahlung in supersymmetric QCD, 12:17148 (R;SU;In Russian)
Particle Production
Heavy flavors, 12:17155 (R;US)
Structure Functions
QCD and hard quark and gluon scattering, 12:17138 (RA;CS)
Vacuum States
Approach to calculation of the infrared region contribution to vacuum expectation values of gluonic and quark fields, 12:17163 (R;SU)

QUASARS
Emission Spectra
Continuum radiation from active galactic nuclei: a statistical study, 12:17039 (R;US)

QUASIPARTICLE-PHONON MODEL
Quasiparticle-phonon nuclear model, 12:17290 (R;SU)
Deformed Nuclei
Basic equations of the quasiparticle-phonon nuclear model for deformed even-even nuclei, 12:17296 (R;SU;In Russian)
Even-Even Nuclei
Basic equations of the quasiparticle-phonon nuclear model for deformed even-even nuclei, 12:17296 (R;SU;In Russian)

QUEENSLAND
Underground Mining
Numerical modelling of development roadways, German Creek Central Colliery, Central Queensland, 12:15320 (R;AU)

QUERCUS
See OAKS

QUINOLINES
Biological Accumulation
Uptake and fate of xenobiotics in plants, 12:16891 (RA;US)
Root Absorption
Uptake and fate of xenobiotics in plants, 12:16891 (RA;US)

R

R CODES
REEPS [Residual End-Use Energy Planning] code: User's guide (Residential End-Use Energy Planning System), 12:16181 (R;US)
RABBITS
Lethal Radiation Dose
Animal mortality resulting from uniform exposures to photon radiations: Calculated LD_{50}s and a compilation of experimental data, 12:16859 (R;US)
RACKS (FUEL)
See FUEL RACKS
RADIATION ACCIDENTS
Emergency Plans
Role of the Federal Radiological Monitoring and Assessment Center (FRMAC) following a radiological accident, 12:16914 (R;US)
RADIATION BURDEN
See RADIATION DOSES
RADIATION DAMAGE (BIOLOGICAL)
See RADIATION INJURIES
RADIATION DECONTAMINATION
See DECONTAMINATION
RADIATION DETECTION
See also COSMIC RAY DETECTION
GAMMA DETECTION
NEUTRON DETECTION
X-RAY DETECTION
Dead Time
Two-source method for determining radiation counting dead time, 12:16662 (J;US)
RADIATION DETECTORS
See also CHERENKOV COUNTERS
GRAVITATIONAL WAVE DETECTORS
IONIZATION CHAMBERS
NEUTRON DETECTORS
POSITION SENSITIVE DETECTORS
PROPORTIONAL COUNTERS
SCINTILLATION COUNTERS
SHOWER COUNTERS
STREAK CAMERAS
Calibration
Technical guidelines for radiological calibrations, 12:16874 (RA;US)
Using a cyclotron plus ECR source for detector evaluation and calibration, 12:16650 (J;NL)
Computerized Simulation
Report of the working group on detector simulation, 12:16594 (R;US)
RADIATION DOSEMETERS
See DOSEMETERS
RADIATION DOSES
S Codes
SKYSHIN: A computer code for calculating radiation dose over a barrier, 12:17330 (R;US)
RADIATION EXPOSURE (DOSES)
See RADIATION DOSES
RADIATION HEATING
S Codes
SHARDA - a program for sample heat, activity, reactivity and dose analysis, 12:17304 (R;IN)
RADIATION HYGIENE
See RADIATION PROTECTION
RADIATION INJURIES
Biological Repair
Sublethal damage is not the same as potentially lethal damage, 12:16867 (RA;US)
RADIATION MONITORS
See also NEUTRON MONITORS
Alpha Detection
High-sensitive and quantitative in-line monitoring method for transplutonium elements separation processes, 12:15382 (R;CN;In Chinese)
Design
Evaluation of use of the NNC Gamma-12 portal monitor for internal dosimetry screening during decommissioning, 12:16012 (RA;US)
Performance
Evaluation of use of the NNC Gamma-12 portal monitor for internal dosimetry screening during decommissioning, 12:16012 (RA;US)
RADIATION PROTECTION
M Codes
MICROSHIELD - a microcomputer program for analyzing dose rate and gamma shielding, 12:16114 (J;US)
Optimization
Two example applications of optimization techniques to radiation protection programmes of United States Department of Energy Contractors, 12:17333 (BA;XA)
P Codes
PROCESS - a source term calculation program for the PC, 12:16113 (J;US)
Personnel
Training requirements for health physicists in the decontamination/decommissioning field, 12:15536 (RA;US)
Remote Handling Equipment
Training program requirements for remote equipment operators in nuclear facilities, 12:16454 (J;US)
Research Programs
Health physics support and assistance to the Department of Energy, 12:16873 (RA;US)
RADIATION SAFETY
See RADIATION PROTECTION
RADIATION SOURCES
For cosmic sources of radiation see also COSMIC GAMMA SOURCES, COSMIC RADIO SOURCES, and COSMIC X-RAY SOURCES.
See also GAMMA SOURCES
SYNCHROTRON RADIATION SOURCES
Calibration
Calibration of high-dose radiation facilities (Handbook), 12:17329 (R;IN)
Regulations
FDA (Food and Drug Administration) compliance program guidance manual (FY 87). Section 4. Medical and radiological devices, 12:16911 (R;US)
RADIATION TRANSPORT
See also CHARGED-PARTICLE TRANSPORT
NEUTRAL-PARTICLE TRANSPORT
G Codes
Conversion of radionuclide transport codes to IBM-compatible microcomputers, 12:17328 (J;US)
L Codes
Conversion of radionuclide transport codes to IBM-compatible microcomputers, 12:17328 (J;US)
RADICIDATION
Cost Benefit Analysis
Proposal for imported fish meal radicidation, 12:16852 (RA;CS;In Czech)
RADIOACTIVATION
Data Covariances
Covariances for measured activation and fission ratios data, 12:17256 (R;US)
RADIOACTIVE BIOLOGICAL WASTES
See RADIOACTIVE WASTES
RADIOACTIVE GASEOUS WASTES
See RADIOACTIVE WASTES
RADIOACTIVE MATERIALS
See also FISSION PRODUCTS
RADIOACTIVE WASTES
Storage
Automated nuclear storage facility, 12:15404 (J;US)
RADIOACTIVE TRACERS
See RADIOPHARMACEUTICALS
RADIOACTIVE WASTE DISPOSAL
Final resting place of a cesium 137 gauge, 12:15559 (RA;US)
Comparative Evaluations
Economics of disposal at future disposal facilities, 12:15460 (J;US)
Cost Benefit Analysis
Cost effectiveness of below-threshold waste disposal at DOE sites, 12:15465 (J;US)

Economics
Cost effectiveness for improved methods of low-level radioactive waste disposal, 12:15463 (J;US)
Economics of disposal at future disposal facilities, 12:15460 (J;US)
Effect of technology on the economics of low-level waste disposal, 12:15461 (J;US)
Modeling the economics of LLW volume reduction, 12:15462 (J;US)
Geology
Hydrogeological basis for the modelling area Oberbauenstock, 12:15434 (R;CH;In German)
Leaching
Waste glass leaching: Chemistry and kinetics, 12:15448 (R;US)
Marine Disposal
Pore-water pressure events during the in situ heat transfer experiment simulation: Piezometer probe technology, 12:15450 (R;US)
Rock Drilling
Exploratory borehole Boettstein: Construction and environmental aspects, drilling techniques, 12:15431 (R;CH;In German)
Site Preparation
Alternative methods to manage waste salt from repository excavation in the Deaf Smith County and Swisher County locations, Texas: A scoping study: Technical report, 12:15407 (R;US)
Site Selection
Site clean-up requirements: where does one dispose of dirt?, 12:15537 (RA;US)
Technical review of US Department of Energy draft area recommendation report for the crystalline repository project, 12:15421 (R;US)
Systems Analysis
Optimized application of systems engineering to nuclear waste repository projects, 12:15471 (J;US)
Underground Disposal
Exploratory borehole Boettstein: Investigation report. Text volume, 12:15430 (R;CH;In German)
Exploratory borehole Boettstein: Construction and environmental aspects, drilling techniques, 12:15431 (R;CH;In German)
Hydrogeological basis for the modelling area Oberbauenstock, 12:15434 (R;CH;In German)
Long-term stability of bentonite under repository conditions, 12:15433 (R;CH;In German)
Shrinkage experiments on bentonite samples, 12:15432 (R;CH;In German)
Some considerations concerning the thermodynamics and kinetics of the reaction between iron and water in bentonite, 12:16406 (R;CH;In German)

RADIOACTIVE WASTE FACILITIES
See also WIPP
Contamination Regulations
Development of residual radioactivity criteria, 12:15490 (RA;US)
Decommissioning
Decontamination/decommissioning of mixed hazardous and radioactive waste disposal sites, 12:15538 (RA;US)
Health physics experience in the decontamination and decommissioning of the 203-S, 204-S, and 205-S uranium nitrate hexahydrate purification and waste tank car unloading facilities, 12:15533 (RA;US)
Decontamination
Decontamination/decommissioning of mixed hazardous and radioactive waste disposal sites, 12:15538 (RA;US)
Health physics experience in the decontamination and decommissioning of the 203-S, 204-S, and 205-S uranium nitrate hexahydrate purification and waste tank car unloading facilities, 12:15533 (RA;US)
Industrial safety and health physics interactions during slurry transfer of 1000 curies of radium residues at the Niagara Falls Storage Site (NFSS), 12:15499 (RA;US)
License Applications
Standard format and content of a license application for a low-level radioactive waste disposal facility: Safety analysis report, 12:15435 (R;US)
Standard review plan for the review of a license application for a low-level radioactive waste disposal facility: Safety analysis report, 12:15436 (R;US)
Materials Testing
Materials aspects of nuclear waste isolation, 12:15486 (BA;US)
Performance
Effect of percolation rate on water-travel time in deep, partially saturated zones, 12:15438 (RA;US)
Fluid flow in a fractured rock mass, 12:15437 (RA;US)
Radiation Protection
Health physics and operational experience gained from slurry transfer of wastes containing 780 curies of radium-226, 12:15556 (RA;US)
Site Selection
Crystalline Repository Project: Review and comment of the Leech Lake Reservation Business Committee: Draft area recommendation report, 12:15420 (R;US)
Draft area recommendation report for the Crystalline Repository Project: Comments: Final technical report, 12:15419 (R;US)
Waste Management
Laboratory protocol for co-contaminated waste, 12:15539 (RA;US)

RADIOACTIVE WASTE MANAGEMENT
Classification
Approach to defining de minimis, intermediate, and other classes of radioactive waste, 12:15459 (J;US)
Grants
Historically Black Colleges and Universities Radioactive Waste Management Research Program: Summary of activities, 1985-1986, 12:15424 (R;US)
Records Management
Logbooks: A key to test/experiment data integrity, 12:15568 (BA;US)
Research Programs
Historically Black Colleges and Universities Radioactive Waste Management Research Program: Summary of activities, 1985-1986, 12:15424 (R;US)
Nuclear engineering, health physics, and radioactive waste management fellowship program: Summary of program activities: Radioactive waste management fellowship, 1985-1986, 12:15423 (R;US)
Risk Assessment
Hazard waste risk assessment, 12:15444 (RA;US)

RADIOACTIVE WASTE PROCESSING
Ceramic Melters
Off-gas chemistry study of melter feed by Springborn Laboratories, 12:15425 (R;US)
Containers
Alternative low-level waste processing techniques, 12:15467 (J;US)
Flocculation
Processing of miscellaneous radioactive effluents by continuous flocculation decantation, 12:15426 (R;FR;In French)
Hot Cells
Remote lighting systems for the defense waste processing facility, 12:15481 (J;US)
Quality Assurance
Quality assurance consideration for cement-based grout technology programs at Oak Ridge National Laboratory, 12:15414 (R;US)
Remote Handling Equipment
Canister grapple for the defense waste processing facility, 12:15482 (J;US)
Closed-circuit television and remote crane control for vitrification facilities, 12:15480 (J;US)
Demonstration of a remotely operated TRU waste size-reduction and material handling process, 12:15484 (J;US)
Equipment experience in a radioactive LFCM vitrification facility, 12:15478 (J;US)
Remote handling of canisters containing nuclear waste in glass at the Savannah River Plant, 12:15477 (J;US)
Stainless steel decontamination manipulators, 12:15479 (J;US)
Remote Viewing Equipment
Closed-circuit television and remote crane control for vitrification facilities, 12:15480 (J;US)

Remote viewing of melter interior: defense waste processing facility, 12:15483 (J;US)
Safety
Council of State decision relating to examinations under Section 5 of the Radiation Protection Act (No. 243/58), 12:15573 (R;FI;In Finnish)
Solidification
Alternative low-level waste processing techniques, 12:15467 (J;US)
Prediction of critical grout parameters: critical flow rate, 12:15469 (J;US)
Vitrification
Canister grapple for the defense waste processing facility, 12:15482 (J;US)
Closed-circuit television and remote crane control for vitrification facilities, 12:15480 (J;US)
Equipment experience in a radioactive LFCM vitrification facility, 12:15478 (J;US)
Remote handling of canisters containing nuclear waste in glass at the Savannah River Plant, 12:15477 (J;US)
Remote viewing of melter interior: defense waste processing facility, 12:15483 (J;US)
Volume
Demonstration of a remotely operated TRU waste size-reduction and material handling process, 12:15484 (J;US)
Evaluation of glovebox sectioning using weld splitting techniques, 12:16458 (J;US)

RADIOACTIVE WASTE STORAGE
See also MONITORED RETRIEVABLE STORAGE
Containers
Cumulative releases of radionuclides from uncontained waste packages, 12:15475 (J;US)
Radionuclide transport through penetrations in nuclear waste containers, 12:15474 (J;US)
Radionuclide Migration
Cumulative releases of radionuclides from uncontained waste packages, 12:15475 (J;US)
Radionuclide transport through penetrations in nuclear waste containers, 12:15474 (J;US)
Underground Storage
Cumulative releases of radionuclides from uncontained waste packages, 12:15475 (J;US)
Prediction of temperatures in underground storage facilities for heat-generating materials at the Idaho Chemical Processing Plant, 12:15472 (J;US)

RADIOACTIVE WASTES
See also ALPHA-BEARING WASTES
HIGH-LEVEL RADIOACTIVE WASTES
INTERMEDIATE-LEVEL RADIOACTIVE WASTES
LOW-LEVEL RADIOACTIVE WASTES
Contamination Regulations
Residual surface contamination limits: problems in interpretation and implementation, 12:15495 (RA;US)
Dose Limits
National and international considerations of a de minimis dose, 12:15491 (RA;US)
Qualitative Chemical Analysis
Radioactive waste assay at the West Valley Demonstration Project, 12:15529 (RA;US)
Radiation Monitoring
Final resting place of a cesium 137 gauge, 12:15559 (RA;US)

RADIOAPPLICATORS
See RADIATION SOURCES

RADIOCHEMISTRY
Measuring Instruments
Analytical instruments at the Institute of Radiochemistry, 12:16430 (R;DE;In German)

RADIODIAGNOSIS (RADIONUCLIDES)
See NUCLEAR MEDICINE

RADIOFREQUENCY SYSTEMS
See RF SYSTEMS

RADIOISOTOPE BATTERIES
Impact Tests
General-Purpose Heat Source Development: Safety Verification Test Program. Flyer plate test series, 12:15582 (R;US)
Safety
General-Purpose Heat Source Development: Safety Verification Test Program. Flyer plate test series, 12:15582 (R;US)

RADIOISOTOPE MIGRATION
See RADIONUCLIDE MIGRATION

RADIOISOTOPE-LABELLED DRUGS
See RADIOPHARMACEUTICALS

RADIOISOTOPES
Spontaneous Fission
Half-lives and kinetic energies for the spontaneously emitted heavy ions from nuclei, 12:17292 (R;SU)
Uptake
A calibration phantom for absolute quantitation of radionuclide uptake by SPECT, 12:16819 (J;US)

RADIOLOGICAL PERSONNEL
Working Conditions
Decree relating to the annual leave of persons working under harmful radiation conditions (No. 175/67), 12:15572 (R;FI;In Finnish)

RADIOLOGICAL PROTECTION
See RADIATION PROTECTION

RADIOLOGY
For the use of radiant energy in medicine.
Management
Selection of patients for x-ray examinations: skull x-ray examination for trauma, 12:16814 (R;US)

RADIONUCLIDE MIGRATION
In environment.
Mathematical Models
Effect of percolation rate on water-travel time in deep, partially saturated zones, 12:15438 (RA;US)
Fluid flow in a fractured rock mass, 12:15437 (RA;US)

RADIONUCLIDE TRANSFER (IN ENVIRONMENT)
See RADIONUCLIDE MIGRATION

RADIONUCLIDES
See RADIOISOTOPES

RADIOPASTEURIZATION
See RADICIDATION

RADIOPHARMACEUTICALS
Chemical Preparation
Design and evaluation of new ruthenium labeled radiopharmaceuticals for the pancreas and heart, 12:16818 (J;US)
Historical Aspects
Medical isotopes at Oak Ridge National Laboratory, 12:16811 (R;US)
Injection
Radiopharmaceutical delivery system for controlled arterial concentration in physiologic modeling with computed tomography, 12:16822 (J;US)
Purification
Design and evaluation of new ruthenium labeled radiopharmaceuticals for the pancreas and heart, 12:16818 (J;US)
Quality Assurance
Joint CDRH (Center for Devices and Radiological Health) and state quality-assurance surveys in nuclear medicine: Phase 2 - radiopharmaceuticals, 12:16861 (R;US)
Tissue Distribution
Design and evaluation of new ruthenium labeled radiopharmaceuticals for the pancreas and heart, 12:16818 (J;US)

RADIOWAVE RADIATION
See also SOLAR RADIO BURSTS
Non-Equilibrium Plasma
Radiation from turbulent plasmas, 12:17404 (RA;CS)

RADIUM 224
Tissue Distribution
Age dependent retention of ^{212}Pb in the skeleton following ^{224}Ra uptake, 12:16857 (R;US)

RADIUM 226
Biological Half-Life
Long-term loss of radium in 63 subjects first exposed at ages 6 to 46, 12:16855 (R;US)

Body Burden
Radium uptake in utero, 12:16856 (R;US)
Isotope Ratio
Gas exchange measurements in natural systems, 12:16789 (BA;US)
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Radium uptake in utero, 12:16856 (R;US)

RADIUM 227
Geochemistry
Geochemistry of Ca, Sr, Ba and Ra sulfates in some deep brines from the Palo Duro basin, Texas, 12:15350 (J;US)

RADIUM D
See LEAD 210

RADIUM F
See POLONIUM 210

RADON 222
Isotope Ratio
Gas exchange measurements in natural systems, 12:16789 (BA;US)

RAILWAYS
Environmental Impacts
Rail transportation corridor analysis report: Deaf Smith County location in the Palo Duro Basin, Texas, 12:15487 (R;US)

RAMAN SPECTROSCOPY
Prior to March 1983 this concept was indexed to RAMAN SPECTRA.
Uses
XPS [x-ray photoelectron spectroscopy], AES [Auger electron spectroscopy], RBS [Rutherford backscattering spectroscopy], NRA [nuclear reaction analysis] and laser Raman studies of high temperature corrosion, 12:16294 (R;US)

RANDOM PHASE APPROXIMATION
Random phase approximation, 12:17286 (R;FR)

RANGE FINDERS
Design
Surface contouring with a range finder, 12:16812 (R;US)

RARE EARTH COMPOUNDS
See also CERIUM COMPOUNDS
MONAZITES
YTTERBIUM COMPOUNDS
Energy Transfer
Energy transfer and non-linear optical properties at near ultraviolet wavelengths: Rare earth 4f → 5d transitions in crystals and glasses: Progress report for the period June 1, 1986 to May 31, 1987, 12:16353 (R;US)
Optical Properties
Energy transfer and non-linear optical properties at near ultraviolet wavelengths: Rare earth 4f → 5d transitions in crystals and glasses: Progress report for the period June 1, 1986 to May 31, 1987, 12:16353 (R;US)

RARE GASES
See also ARGON
HELIUM
KRYPTON
NEON
XENON
Adsorption
Heat capacities of rare gases adsorbed on graphite. Technical report, 12:16345 (R;US)
Atom-Atom Collisions
Asymmetric scattering in thermal collisions of alkali (/sup 2/P/sub 3/2/)-atoms with rare gas atoms: Na(3/sup 2/P/sub 3/2/) and K(4/sup 2/P/sub 3/2/) with Ne, Ar and Kr, 12:17079 (RA;CS)
Nonlinear Optics
Physical processes at high field strengths, 12:17066 (R;US)
Specific Heat
Heat capacities of rare gases adsorbed on graphite. Technical report, 12:16345 (R;US)

RATS
Lethal Radiation Dose
Animal mortality resulting from uniform exposures to photon radiations: Calculated LD_{50s} and a compilation of experimental data, 12:16859 (R;US)

RAW MATERIALS
Testing
Pilot plant evaluation of Illinois No. 6 and Pittsburgh No. 8 coal for the Texaco coal gasification process: Final report, 12:15288 (R;US)

RDF
See REFUSE DERIVED FUELS

REACTION INTERMEDIATES
Alkylation
Chemical trapping of CO/H_2 surface species: Quarterly report, 12:15286 (R;US)

REACTION KINETICS
See also NUCLEAR REACTION KINETICS
Application of hot spot conception to analysis of spectra from reactions with light bombarding nuclei, 12:17225 (R;SU;In Russian)

REACTION MECHANISMS

Computerized Simulation
PC-based flux mapping data collection system, 12:15829 (J;US)

Damage
The relationships and influences of fuel and coolant system processes during LWR severe accidents, 12:16061 (R;US)

Data Acquisition Systems
PC-based flux mapping data collection system, 12:15829 (J;US)

Deformation
Bowing of elements and changes in radial coolant temperature profile over subassembly lifetime, 12:15865 (J;US)

Design
Physics considerations in the design of long-life cores, 12:15862 (J;US)
Safety aspects of LMR [liquid metal-cooled reactor] core design, 12:16015 (R;US)
Transient bowing of core assemblies in advanced liquid metal fast reactors, 12:15846 (R;US)

Heat Transfer
Bowing of elements and changes in radial coolant temperature profile over subassembly lifetime, 12:15865 (J;US)
Countercurrent flow and flooding with abrupt area changes, 12:15793 (J;US)
Dual loop jet pump model for BWR stability analysis, 12:15795 (J;US)
Evaluation of the thermal safety margin for the KMRR using the hot-spot-factor approach, 12:16003 (J;US)
Prediction of transient axial power distribution for calculation of the DNBR limit, 12:15794 (J;US)
Hydraulics
Bowing of elements and changes in radial coolant temperature profile over subassembly lifetime, 12:15865 (J;US)
Countercurrent flow and flooding with abrupt area changes, 12:15793 (J;US)
Dual loop jet pump model for BWR stability analysis, 12:15795 (J;US)
Evaluation of the thermal safety margin for the KMRR using the hot-spot-factor approach, 12:16003 (J;US)
Prediction of transient axial power distribution for calculation of the DNBR limit, 12:15794 (J;US)
Neutron Dosimetry
Reactor physics (nuclear power plant design and operation) and in core dosimetry, 12:16620 (RA;CS;In Czech)
Neutron Flux
PC-based flux mapping data collection system, 12:15829 (J;US)
Startup range neutron monitor period-based transient monitor, 12:15788 (J;US)
Neutron Spectra
Calculations of spatial and energy distribution of neutrons in reactor core and shielding. Part 2, 12:15927 (RA;CS;In Czech)
Neutron Spectroscopy
Spectrometry and in core dosimetry of neutron radiation. Part I. Invited papers, 12:16619 (R;CS;In Czech)
Neutron Transport
Calculations of spatial and energy distribution of neutrons in reactor core and shielding. Part 1, 12:15926 (RA;CS;In Czech)
Planning
Qualification of an LWBR-irradiated fuel assay gauge, 12:15864 (J;US)
Power Distribution
ARMP-02 documentation: Part 2, Chapter 12, NORGE-B2 computer code manual: Volume 2, User's manual, 12:15777 (R;US)
ARMP-02 documentation: Part 2, Chapter 7, MICBURN-E computer code manual: Volume 1, Theory and numerics manual, 12:15774 (R;US)
ARMP-02 documentation: Part 2, Chapter 12, NORGE-B2 computer code manual: Volume 3, Programmer's manual, 12:15775 (R;US)
Reactivity
Effect of a detailed radial core expansion reactivity feedback model on ATWS calculations using SASSYS/SAS4A, 12:16075 (J;US)
Impacts of reactivity feedback uncertainties on inherent shutdown in innovative designs, 12:16076 (J;US)
Reactor Core Restraints
Transient bowing of core assemblies in advanced liquid metal fast reactors, 12:15846 (R;US)
Service Life
Physics considerations in the design of long-life cores, 12:15862 (J;US)

REACTOR DECOMMISSIONING
Cost Recovery
Nuclear decommissioning - the financial R & R problems, 12:15905 (J;US)
Financing
Utility perspectives on decommissioning - the accounting involvement, 12:16065 (J;US)
Planning
Utility perspectives on decommissioning - the accounting involvement, 12:16065 (J;US)

REACTOR DISMANTLING
Remote Handling Equipment
Design and testing of remote handling systems for reprocessing plant maintenance and for nuclear reactor dismantling, 12:15394 (J;US)
Integrated defueling system for Three Mile Island Unit 2, 12:16127 (J;US)

REACTOR FUEL ELEMENTS

REACTOR INSTRUMENTATION
Service Life
Baseline characterization of electrical circuits to support plant life extension, 12:15821 (J;US)
Testing
Baseline characterization of electrical circuits to support plant life extension, 12:15821 (J;US)

REACTOR KINETICS
A Codes
Method of baffle/reflector region homogenization, 12:15816 (J;US)
Pin Power prediction in the Westinghouse Advanced Nodal Code, 12:15815 (J;US)
Albedo
Method of baffle/reflector region homogenization, 12:15816 (J;US)
Computer Calculations
Different perspectives on the use of personal computers for technical analyses, 12:16449 (J;US)
PC-class microcomputer experience in radiation protection and shielding analysis at INEL, 12:16448 (J;US)
Computerized Simulation
Development and applications of core simulation for the Hanford N Reactor, 12:15841 (J;US)
Feedback simulation of ramped power transients using transfer functions, 12:15931 (J;US)
Flux flattening in a graphite-moderated core, 12:15842 (J;US)
Implicit Kalman filter algorithm for nuclear reactor analysis, 12:15963 (J;US)
Improved numerical method for subchannel cross-flow calculations, 12:15784 (J;US)
Parity simulation for nuclear plant analysis, 12:15928 (J;US)
Perturbation Theory
GPT methods for fuel evolution and shuffling studies, 12:15929 (J;US)
Reactivity Worths
Reactivity worth of gas expansion modules (GEMs) in the fast flux test facility, 12:15861 (J;US)

REACTOR MAINTENANCE
Radiation Protection
Tomorrow's mobile robots in today's nuclear power plants, 12:16131 (J;US)
Remote Handling Equipment
Monitor III, 12:15923 (J;US)
Robotic system for remote maintenance of a pulsed nuclear reactor, 12:16002 (J;US)

REACTOR MATERIALS
To be assigned in conjunction with the specific descriptor for the material used in a reactor, provided this descriptor is not yet up-posted to reactor materials.
See also NUCLEAR FUELS
Aging
Aging degradation of cast stainless steel, 12:15765 (R;US)

REACTOR NOISE
Computerized Simulation
Digital generation of stochastic signals of arbitrary spectral shape, 12:15925 (R;CH)

REACTOR OPERATION
Computerized Simulation
U-tube steam generator model for the DSNP language, 12:15831 (J;US)
Perturbation Theory
System reliability analysis via generalized perturbation theory methods, 12:15930 (J;US)

Systems Analysis
System reliability analysis via generalized perturbation theory methods, 12:15930 (J;US)
REACTOR OPERATORS
Training
Application of embedded training in nuclear power plant control rooms, 12:16071 (J;US)
REACTOR PHYSICS
Use only for indexing articles of very broad coverage, such as annual reviews, text book, etc.

RISK ASSESSMENT
Human Factors
Benchmark of systematic human action reliability procedure, 12:16068 (J;US)
Human factors in risk assessments of nuclear power plants, 12:16070 (J;US)
Information Dissemination
Confidence in technologies: Interactions between publics and industries, 12:16912 (R;US)
L Codes
LAVA [Los Alamos Vulnerability and Risk Assessment Methodology]: A conceptual framework for automated risk analysis, 12:15565 (R;US)

Probability
Continuous Bayesian updating; Normal and two stage, 12:16095 (J;US)
Method to integrate PRA results with plant upgrades, 12:16110 (J;US)
Probabilistic analysis of allowed outage times relaxation at a PWR plant, 12:16099 (J;US)
Quantile arithmetic methodology for uncertainty propagation in fault trees, 12:16111 (J;US)
Public Opinion
Confidence in technologies: Interactions between publics and industries, 12:16912 (R;US)
Surveys
An experiment in combining estimates of uncertainty, 12:16913 (R;US)
RIVER BEND-1 REACTOR
St. Francisville, Louisiana, USA
Nuclear Materials Management
Nuclear fuels accounting interface: River Bend experience, 12:15778 (J;US)
RIVER BEND-2 REACTOR
St. Francisville, Louisiana, USA
Nuclear Materials Management
Nuclear fuels accounting interface: River Bend experience, 12:15778 (J;US)
ROAD TRANSPORT
Risk Assessment
Validation study of the intertran model for assessing risks of transportation accidents: Road transport of uranium hexafluoride, 12:15489 (R;FR)
ROADWAYS (MINES)
See MINE ROADWAYS
ROBOTS
Computer Graphics
Interactive animated displayed of man-controlled and autonomous robots, 12:16459 (J;US)
Electronic Guidance
3-D world modeling with updating capability based on combinatorial geometry, 12:16440 (R;US)
Performance
Experience with the Surveyor mobile robot in radioactive work environments, 12:16457 (J;US)
Tools for decontamination and decommissioning of nuclear facilities, 12:16456 (J;US)
Uses
Evaluating telerobotics for battlefield support operations, 12:16441 (R;US)
Experience with the Surveyor mobile robot in radioactive work environments, 12:16457 (J;US)
Mobilization of existing robotic and teleoperated mobile vehicles to mitigate the consequences of radiological emergencies; a TMI-2 reality and a Chernobyl scenario, 12:16073 (J;US)
Operational experiences with a remote core-boring device, 12:16130 (J;US)
Robotics development at TMI-2, 12:16129 (J;US)
Tomorrow's mobile robots in today's nuclear power plants, 12:16131 (J;US)
Tools for decontamination and decommissioning of nuclear facilities, 12:16456 (J;US)
ROCK MECHANICS
Bench-Scale Experiments
Preliminary rock mechanics laboratory: Investigation plan, 12:16924 (R;US)
ROCK SALT
See SALT DEPOSITS
RODS (FUEL)
See FUEL RODS
ROTORS
Stress Corrosion
Monitoring of steam turbine environments for detection of stress corrosion cracking, 12:15694 (RA;US)
On-line rotor crack detection monitoring system, 12:15695 (RA;US)
RUBIDIUM
X-Ray Fluorescence Analysis
X-ray fluorescence method for the determination of potassium, rubidium and cesium in thoria, 12:16374 (R;IN)
RUBY
Electron Collisions
Defects and color centers induced in corundum and ruby by high energy electrons. 3. Optical properties of corundum irradiated by high energy electrons, 12:17344 (R;SU;In Russian)
RUPTURE DISKS
See RELIEF VALVES
RUTHENIUM
Catalytic Effects
Chemical trapping of CO/H_2 surface species: Quarterly report, 12:15286 (R;US)
RUTHENIUM 97
Diagnostic Uses
Design and evaluation of new ruthenium labeled radiopharmaceuticals for the pancreas and heart, 12:16818 (J;US)
Uptake
Design and evaluation of new ruthenium labeled radiopharmaceuticals for the pancreas and heart, 12:16818 (J;US)
RUTHENIUM COMPLEXES
Catalytic Effects
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Final quarterly technical progress report No. 4 for the period 1 July to 30 September 1986, 12:15284 (R;US)
Oxidation
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
Photochemical Reactions
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
RUTHERFORD SCATTERING
Uses
XPS [x-ray photoelectron spectroscopy], AES [Auger electron spectroscopy], RBS [Rutherford backscattering spectroscopy], NRA [nuclear reaction analysis] and laser Raman studies of high temperature corrosion, 12:16294 (R;US)

S

S CODES
SSYST: A code-system for analyzing transient LWR fuel rod behaviour under off-normal conditions, 12:16145 (BA;US)
S WAVES (SEISMIC)
See SEISMIC S WAVES
SACCHAROMYCES CEREVISIAE
Pellets
Development and modelling of a gas/solid fluidized-bed fermenter for ethanol production from S. cerevisiae, 12:15590 (R;DE;In German)
SACLAY LINAC
Beam Dynamics
Feedback system analysis for beam breakup in a multipass multisection electron linac, 12:16507 (R;FR)
Feasibility Studies
Feedback system analysis for beam breakup in a multipass multisection electron linac, 12:16507 (R;FR)
Feedback
Feedback system analysis for beam breakup in a multipass multisection electron linac, 12:16507 (R;FR)
SAFE LOW POWER CRITICAL EXPERIMENT
See SLOWPOKE TYPE REACTORS
SAFETY (NUCLEAR)
See RADIATION PROTECTION
SAFETY (REACTOR)

SALT DEPOSITS
Creep
Laboratory investigation of crushed salt consolidation and fracture healing, 12:16925 (R;US)
Excavation
Alternative methods to manage waste salt from repository excavation in the Deaf Smith County and Swisher County locations, Texas: A scoping study: Technical report, 12:15407 (R;US)
Geologic Fractures
Laboratory investigation of crushed salt consolidation and fracture healing, 12:16925 (R;US)
Porosity
Laboratory investigation of crushed salt consolidation and fracture healing, 12:16925 (R;US)
Radioactive Waste Disposal
Alternative methods to manage waste salt from repository excavation in the Deaf Smith County and Swisher County locations, Texas: A scoping study: Technical report, 12:15407 (R;US)
Rock Mechanics
Preliminary rock mechanics laboratory: Investigation plan, 12:16924 (R;US)
SAMARIUM
Activation Analysis
Analysis of rare earths and cadmium in reference materials: Li_2SO_4 and $MnSO_4$, 12:16386 (R;FR)
Emission Spectroscopy
Analysis of rare earths and cadmium in reference materials: Li_2SO_4 and $MnSO_4$, 12:16386 (R;FR)
SAMARIUM 154 TARGET
Argon 40 Reactions
Study of cluster emission by excited compound nuclei, 12:17293 (R;SU;In Russian)
SAN ONOFRE-1 REACTOR
San Clemente, California, USA
Feedwater
New scenario for intersystem LOCAs in BWRs, 12:16098 (J;US)
Loss of Coolant
New scenario for intersystem LOCAs in BWRs, 12:16098 (J;US)
Reactor Components
Search of excellence: the problems of material aging and reliability in an older nuclear unit at the Southern California Edison company, 12:15828 (J;US)
Reactor Instrumentation
Baseline characterization of electrical circuits to support plant life extension, 12:15821 (J;US)
Reactor Safety
New scenario for intersystem LOCAs in BWRs, 12:16098 (J;US)
SANDIA LABORATORIES
Radioactive Waste Management
Logbooks: A key to test/experiment data integrity, 12:15568 (BA;US)
Records Management
Logbooks: A key to test/experiment data integrity, 12:15568 (BA;US)
Waste Transportation
Logbooks: A key to test/experiment data integrity, 12:15568 (BA;US)
SANDSTONES
Chemical Composition
1985/1986 SOMED [School of Mines and Energy Development] project: The effect of temperature, fluid composition, and flow rate on sandstones: implications for enhanced oil recovery methods: Final report, 12:15356 (R;US)
Fluid Flow
1985/1986 SOMED [School of Mines and Energy Development] project: The effect of temperature, fluid composition, and flow rate on sandstones: implications for enhanced oil recovery methods: Final report, 12:15356 (R;US)
Rock-Fluid Interactions
1985/1986 SOMED [School of Mines and Energy Development] project: The effect of temperature, fluid composition, and flow rate on sandstones: implications for enhanced oil recovery methods: Final report, 12:15356 (R;US)
SATELLITE ATMOSPHERES
For atmospheres of the natural satellites.
Spectral Reflectance
Search for volatiles in the surface of icy satellites, 12:16972 (RA;US)
SATELLITES
Infrared Spectra
Planetary spectroscopy, 12:17005 (RA;US)
SATURN PLANET
Brightness
Lunar and planetary studies, 12:16984 (RA;US)
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)
Carbon Monoxide
Infrared spectroscopy of Jupiter and Saturn, 12:16980 (RA;US)
Deuterium Compounds
Spectroscopic observations of the planets, 12:16986 (RA;US)
Hydrogen
Continued program of planetary study at the University of Texas McDonald Observatory, 12:16988 (RA;US)
Extended atmospheres of outer planet satellites and comets. Annual report, 1 August 1985-31 July 1986, 12:17031 (R;US)
Infrared Spectra
Planetary infrared astronomy using a cryogenic postdisperser on Fourier transform spectrometers, 12:16977 (RA;US)
Planetary optical and infrared imaging, 12:17022 (RA;US)
Magnetic Fields
Pioneer 10 and 11 (Jupiter and Saturn) magnetic field experiments. Final report, 12:17032 (R;US)
Methane
Continued program of planetary study at the University of Texas McDonald Observatory, 12:16988 (RA;US)
Outer planet studies, 12:16981 (RA;US)
Microwave Spectra
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)
Temperature Distribution
Infrared observations of planetary atmospheres, 12:16985 (RA;US)
SAVANNAH RIVER PLANT
Pyrochemical Reprocessing
Interfacing solvent extraction in the recovery of pyrochemical residues at the Savannah River Plant, 12:15387 (R;US)
SCANDIUM
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
SCANDIUM 45
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
SCANDIUM 47
Half-Life
Uncertainties in scientific measurements, 12:17216 (R;US)
SCANDIUM COMPOUNDS
Chemical Preparation
σ bond metathesis for C-H bonds of hydrocarbons and Sc-R (R = H, alkyl, aryl) bonds of permethylscandocene derivatives. Evidence for noninvolvement of the π system in electrophilic activation of aromatic and vinylic C-H bonds, 12:16414 (J;US)
Chemical Reactions
σ bond metathesis for C-H bonds of hydrocarbons and Sc-R (R = H, alkyl, aryl) bonds of permethylscandocene

derivatives. Evidence for noninvolvement of the π system in electrophilic activation of aromatic and vinylic C-H bonds, 12:16414 (J;US)
Molecular Structure
σ bond metathesis for C-H bonds of hydrocarbons and Sc-R (R = H, alkyl, aryl) bonds of permethylscandocene derivatives. Evidence for noninvolvement of the π system in electrophilic activation of aromatic and vinylic C-H bonds, 12:16414 (J;US)

SCANNING MEASURING PROJECTORS
On-Line Measurement Systems
Dialogue scanning measuring systems, 12:16637 (R;SU;In Russian)

SCATTERING
See also LIGHT SCATTERING
Three-Body Problem
Consideration of the (n,d) and (p,d) scattering and breakup reactions through singular integral equations, 12:17279 (RA;CS)

SCHOOL BUILDINGS
Energy Conservation
ICP [Institutional Conservation Program] monitoring: Final report, 12:16201 (R;US)
Monitoring
ICP [Institutional Conservation Program] monitoring: Final report, 12:16201 (R;US)

SCHROEDINGER EQUATION
Solitons
Approximate two-soliton solution of a generalized Schroedinger equation in nuclear hydrodynamics, 12:17375 (R;SU)

SCIENTIFIC PERSONNEL
Training
Committee on Atomic and Molecular Sciences: Technical progress report for the period February 1, 1986-January 31, 1987, 12:17069 (R;US)

SCINTILLATION CHAMBERS
See SCINTILLATION COUNTERS

SCINTILLATION COUNTERS
See also LIQUID SCINTILLATION DETECTORS
Calibration
Calibration of thermonuclear neutron detectors, 12:17414 (R;SU;In Russian)
Charge-Coupled Devices
CCD[charge-coupled device]-based synchrotron x-ray detector for protein crystallography: Performance projected from an experiment, 12:16600 (R;US)
Helium 3 Target
Advances in the use of ^{3}He in gas scintillation counters, 12:16669 (J;US)

SCINTILLATION DETECTORS
See SCINTILLATION COUNTERS

SCOTLAND
See UNITED KINGDOM

SCRAP METALS
Waste Processing
Cleanup operations at the Oak Ridge Gaseous Diffusion Plant contaminated metal scrapyard, 12:15415 (R;US)

SEA DISPOSAL
See MARINE DISPOSAL

SEALS
Leaks
Monitoring and diagnostic system for reactor coolant pump seals, 12:15947 (RA;US)
Reactor coolant pump seal leakage monitoring, 12:15946 (RA;US)

SEAWATER
PH Value
Carbonate chemistry during WEPOLEX-81, 12:16790 (J;US)

SEBACEOUS GLANDS
See SKIN

SECONDARY BATTERIES
See ELECTRIC BATTERIES

SECONDARY BEAMS
Performance
Production of secondary radioactive beams from 44 MeV/u Ar projectiles, 12:16559 (R;FR)

SECONDARY COOLANT CIRCUITS
Magnetite
Secondary-side chemical cleaning of Oconee nuclear station steam generators, 12:15825 (J;US)
Water Chemistry
Improved water chemistry controls for minimizing degradation of materials, 12:15811 (J;US)

SECONDARY EMISSION
Thin Films
MeV heavy ion induced desorption from insulating films as function of projectile velocity, 12:17080 (R;FR)

SECONDARY RECOVERY
See ENHANCED RECOVERY

SEDIMENTS
Chemical Composition
Organic storage of CO_2 on the continental slope off the mid-Atlantic bight, the southeastern Bering Sea, and the Peru coast, 12:16786 (J;GB)
Drill Cores
Structure and timing of the last deglaciation: oxygen-isotope evidence, 12:16922 (J;GB)
Environmental Transport
Sediment transport characteristics of the nearshore zone between Hilton Head and Ossabaw Islands, Georgia as determined by heavy mineral analysis, 12:16934 (R;US)

SEFOR REACTOR
Reactor Decommissioning
Gamma analysis of soil at SEFOR, a decommissioned reactor, 12:16000 (J;US)
Soils
Gamma analysis of soil at SEFOR, a decommissioned reactor, 12:16000 (J;US)

SEISMIC EFFECTS
Mathematical Models
Dynamic parameters of seismic waves and the seismic threat to a nuclear power plant site, 12:16039 (RA;CS;In Czech)
Present state of earthquake resistance calculations for the main generating units of nuclear power plants Mochovce and Temelin, 12:16040 (RA;CS;In Czech)
Synthetic seismic shifts and prospects of application, 12:15967 (RA;CS;In Slovak)
Simulation
Physics modelling of reactor V 213-C seismic response, 12:16052 (RA;CS;In Czech)
Soil-Structure Interactions
Validation of seismic soil-structure interaction analysis methods: EPRI [Electric Power Research Institute]/NRC [Nuclear Regulatory Commission] cooperation in Lotung, Taiwan, experiments, 12:16019 (R;US)

SEISMIC P WAVES
Wave Propagation
Experimental studies of elastic-wave propagation in a columnar-jointed rock mass, 12:16926 (J;US)

SEISMIC S WAVES
Wave Propagation
Experimental studies of elastic-wave propagation in a columnar-jointed rock mass, 12:16926 (J;US)

SELENIUM
Emission Spectroscopy
Quality of leachate from retorted oil shale wetted with treated process waters, 12:15375 (R;US)

SEMICONDUCTOR LASERS
Electron Beam Pumping
Electron-pumped high-efficiency semiconductor laser, 12:16462 (R;US)

SEMICONDUCTOR MATERIALS
If possible index also the specific compounds.
Annealing
Amorphous materials and recrystallization, 12:16372 (BA;US)
Crystal Doping
The effects of heavy doping on the electronic states in semiconductors, 12:17340 (R;US)
Energy Levels
Density of states due to pairing of impurities in semiconductor systems, 12:16359 (R;BR)

Heat Transfer
Spatially-resolved non-contact methods for the investigation of transport and defects in semiconductors, 12:16398 (BA;US)
Impurities
Density of states due to pairing of impurities in semiconductor systems, 12:16359 (R;BR)
Ion Implantation
Amorphous materials and recrystallization, 12:16372 (BA;US)
Optical Properties
Spatially-resolved non-contact methods for the investigation of transport and defects in semiconductors, 12:16398 (BA;US)
Photo-Induced Transient Spectroscopy
Spatially-resolved non-contact methods for the investigation of transport and defects in semiconductors, 12:16398 (BA;US)
Recrystallization
Amorphous materials and recrystallization, 12:16372 (BA;US)

SEQUESTRENE
See EDTA

SEQUOYAH NUCLEAR POWER PLANT UNIT-1
See SEQUOYAH-1 REACTOR

SEQUOYAH-1 REACTOR
Daisy, Tennessee, USA
Fuel Management
Low-leakage fuel management in Sequoyah, 12:15806 (J;US)
Reactor Core Disruption
Evolution of PRA methodology and insights since WASH-1400, 12:16085 (J;US)
Summary of core damage frequency from internal initiators: Sequoyah, 12:16083 (J;US)
Risk Assessment
Evolution of PRA methodology and insights since WASH-1400, 12:16085 (J;US)
Summary of core damage frequency from internal initiators: Sequoyah, 12:16083 (J;US)

SERPUKHOV SYNCHROTRON
Beam Production
Relativistic positronium channel at the IHEP accelerator, 12:16555 (R;SU;In Russian)
Neutron Spectra
Low-energy neutron spectra behind the IHEP accelerator shields, 12:16556 (R;SU;In Russian)
Positronium
Relativistic positronium channel at the IHEP accelerator, 12:16555 (R;SU;In Russian)

SERVICE WATER SYSTEMS
See AUXILIARY WATER SYSTEMS

SEWAGE SLUDGE
Biodegradation
Design and construction of a reactor system to model the anaerobic/oxic wastewater treatment system, 12:16835 (RA;US)
Investigations into the mechanisms of interaction between to microbial populations in activated sludge, 12:16837 (RA;US)
Microbial selection in an artificial ecosystem, 12:16838 (RA;US)
Flocculation
Investigations into the mechanisms of interaction between to microbial populations in activated sludge, 12:16837 (RA;US)
Microbial selection in an artificial ecosystem, 12:16838 (RA;US)

SHAFTS
Acoustic Emission Testing
Acoustic emission monitoring of steam turbines: a review of progress, 12:15698 (RA;US)
Cracking
Acoustic emission monitoring of steam turbines: a review of progress, 12:15698 (RA;US)

SHALE OIL
See also SHALE OIL FRACTIONS
Chemical Composition
Assay products from Green River oil shale, 12:15373 (R;US)
Density
Assay products from Green River oil shale, 12:15373 (R;US)

SHALE OIL FRACTIONS
Mutagen Screening
Complex mixtures: comparative chemical and toxicological characterization, 12:15336 (RA;US)

SHEAR WAVES (SEISMIC)
See SEISMIC S WAVES

SHEARON HARRIS-1 REACTOR
See HARRIS-1 REACTOR

SHEATHS (FUEL)
See FUEL CANS

SHEEP
Lethal Radiation Dose
Animal mortality resulting from uniform exposures to photon radiations: Calculated LD_{50}s and a compilation of experimental data, 12:16859 (R;US)

SHELLS
Structural forms; for electron shells in atoms use ELECTRONIC STRUCTURE.
Stability
Theoretical assessment of a proposal for the simplified determination of critical loads of elastic shells, 12:17437 (R;DE)

SHF RADIATION
See RADIOWAVE RADIATION

SHIELDING
See also MAGNETIC SHIELDING
Buildup
New buildup factor data for point kernel calculations, 12:16450 (J;US)
Computer Calculations
Different perspectives on the use of personal computers for technical analyses, 12:16449 (J;US)
New buildup factor data for point kernel calculations, 12:16450 (J;US)
PC-class microcomputer experience in radiation protection and shielding analysis at INEL, 12:16448 (J;US)
Data Base Management
New buildup factor data for point kernel calculations, 12:16450 (J;US)
Design
Shielding design at Fermilab: Calculations and measurements, 12:16549 (R;US)
M Codes
MICROSHIELD - a microcomputer program for analyzing dose rate and gamma shielding, 12:16114 (J;US)

SHIELDING MATERIALS
Contamination
Radioactive contaminations of materials for low-background setups, 12:16643 (R;SU;In Russian)

SHIELDS
Design
Activation analysis of the Compact Ignition Tokamak, 12:17598 (J;US)
Eddy Currents
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)
F Codes
Issues and test requirements in radiation shielding of fusion reactors, 12:17532 (J;US)
Performance Testing
Issues and test requirements in radiation shielding of fusion reactors, 12:17532 (J;US)
Technical requirements of experiments and facilities for fusion nuclear technology, 12:17529 (J;US)
Research Programs
Technical requirements of experiments and facilities for fusion nuclear technology, 12:17529 (J;US)
Torque
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)

SHIPPINGPORT PRESSURIZED WATER REACTOR
See SHIPPINGPORT REACTOR

SHIPPINGPORT REACTOR
Spent Fuel Elements
Qualification of an LWBR-irradiated fuel assay gauge, 12:15864 (J;US)

SHIPS
Design
Structural optimization of large ocean-going structures, 12:16501 (RA;US)

SHOCK ABSORBERS
Plasticity
Survey of existing literature in the field of shock-absorbing materials with a view to subsequent adaptation of plastic deformation codes. Phase 1, 12:16442 (R;FR)
SHOCK WAVES
Acceleration
Shock wave acceleration, 12:16956 (RA;CS)
SHOWER COUNTERS
Detects high energy gamma radiation or high energy particles on basis of cascade showers in layered absorbers.
Energy Absorption
Radial distributions of shower energy deposition in hadron and photon hodoscopic sandwich-type calorimeters with cell structure, 12:16616 (R;SU;In Russian)
Hodoscopes
Radial distributions of shower energy deposition in hadron and photon hodoscopic sandwich-type calorimeters with cell structure, 12:16616 (R;SU;In Russian)
Photon Transport
Monte-Carlo simulation of electromagnetic showers, 12:16603 (R;SU;In Russian)
SHOWERS
See also CASCADE SHOWERS
Computerized Simulation
Monte-Carlo simulation of electromagnetic showers, 12:16603 (R;SU;In Russian)
SI SEMICONDUCTOR DETECTORS
Performance
Performance of a novel silicon detector, 12:16660 (J;NL)
Testing
Detection of charged particles in amorphous silicon layers, 12:16655 (J;NL)
SIALON
See ALUMINIUM OXIDES
SILICON NITRIDES
SID
See SUDDEN IONOSPHERIC DISTURBANCE
SIEMENS UNTERRICHTSREAKTOR
See SUR-100 SERIES REACTOR
SIGMA MODEL
Chiral Symmetry
Dualities in the d=2 asymmetric chiral field sigma models, 12:17171 (R;SU)
Duality
Dualities in the d=2 asymmetric chiral field sigma models, 12:17171 (R;SU)
SILICEOUS ROCK
See SANDSTONES
SILICON
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Half-Life
Application of the PFIS method to the LISE spectrometer at GANIL: (Experiment beta performed at the GANIL National Laboratory in Caen (France)) beta decay of light neutron rich exotic nuclei, 12:17217 (R;FR)
Ion Beam Injection
Surface modification of solids, 12:16317 (BA;US)
Ion Implantation
Transient enhanced diffusion and gettering of dopants in ion implanted silicon, 12:16364 (J;US)
Laser Beam Machining
Surface modification of solids, 12:16317 (BA;US)
Melting
Time-resolved ellipsometry and reflectivity measurements of the optical properties of silicon during pulsed excimer laser irradiation, 12:16369 (J;US)
Microelectronics
Assessment of silicon-on-insulator technologies for VLSI (very large scale integration), 12:16486 (R;US)
Physical Radiation Effects
Dose dependence of ion beam mixing of Au on amorphous and single crystalline Si and Ge, 12:16316 (J;US)
Modeling of undercooling, nucleation, and multiple phase front formation in pulsed-laser-melted amorphous silicon, 12:16370 (J;US)
Time resolved studies of rapid solidification in highly undercooled molten silicon, 12:16368 (J;US)
Time-resolved ellipsometry and reflectivity measurements of the optical properties of silicon during pulsed excimer laser irradiation, 12:16369 (J;US)
Transient enhanced diffusion and gettering of dopants in ion implanted silicon, 12:16364 (J;US)
Production
Silicon production in a fluidized bed reactor: Final report, 12:15606 (R;US)
Solidification
Modeling of undercooling, nucleation, and multiple phase front formation in pulsed-laser-melted amorphous silicon, 12:16370 (J;US)
Time resolved studies of rapid solidification in highly undercooled molten silicon, 12:16368 (J;US)
Solubility
Fuel savings by controlling SiO/sub 2/ reduction in blast furnaces. Pt. 1. Laboratory research into the mechanism of SiO/sub 2/ reduction. Final report, 12:16239 (R;DE;In German)
Surface Properties
Simulation studies for surfaces and materials strength. Semiannual report, 1 May-31 October 1986, 12:16290 (R;US)
Surface Treatments
Surface modification of solids, 12:16317 (BA;US)
SILICON 28 REACTIONS
Incomplete Fusion Reactions
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)
SILICON 28 TARGET
Neutron Reactions
Neutron scattering on light even-even nuclei, 12:17214 (RA;CS)
Silicon 28 Reactions
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)
SILICON 35
Half-Life
Application of the PFIS method to the LISE spectrometer at GANIL: (Experiment beta performed at the GANIL National Laboratory in Caen (France)) beta decay of light neutron rich exotic nuclei, 12:17217 (R;FR)
SILICON 36
Half-Life
Application of the PFIS method to the LISE spectrometer at GANIL: (Experiment beta performed at the GANIL National Laboratory in Caen (France)) beta decay of light neutron rich exotic nuclei, 12:17217 (R;FR)
SILICON ALLOYS
Phase Studies
Phases in U-Si alloys, 12:16256 (R;US)
SILICON CARBIDES
Neutron Fluence
Radiation effects on structural ceramics in fusion, 12:17572 (J;US)
Physical Radiation Effects
Radiation effects on structural ceramics in fusion, 12:17572 (J;US)
Voids
NDE reliability and process control for structural ceramics, 12:16333 (R;US)
SILICON COMPOUNDS
See also SILANES, SILOXANES and SILICONES.
See also SILICON CARBIDES
SILICON FLUORIDES
SILICON NITRIDES
SILICON OXIDES
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)

Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)

SILICON FLUORIDES
Auger Electron Spectroscopy
Photoionization of atoms and small molecules using synchrotron radiation (SF_6, SiF_4), 12:17082 (R;US)
Photoelectron Spectroscopy
Photoionization of atoms and small molecules using synchrotron radiation (SF_6, SiF_4), 12:17082 (R;US)

SILICON NITRIDES
Crack Propagation
Slow crack growth in sintered silicon nitride, 12:16339 (BA;US)
Voids
NDE reliability and process control for structural ceramics, 12:16333 (R;US)

SILICON OXIDES
Hydration
Hydrogen doping of silica by ion beam enhanced hydration, 12:16349 (R;FR)
Physical Radiation Effects
Hydrogen doping of silica by ion beam enhanced hydration, 12:16349 (R;FR)
Reduction
Fuel savings by controlling SiO/sub 2/ reduction in blast furnaces. Pt. 1. Laboratory research into the mechanism of SiO/sub 2/ reduction. Final report, 12:16239 (R;DE;In German)
Thermodynamic Properties
Thermodynamic performance of ceramic tritium breeding blanket material, 12:17580 (J;US)
Voids
NDE reliability and process control for structural ceramics, 12:16333 (R;US)

SILICON SEMICONDUCTOR DETECTORS
See SI SEMICONDUCTOR DETECTORS

SILICON SOLAR CELLS
Electric Contacts
Silicon solar cells with polysilicon contacts, 12:15612 (R;US)

SILOETTE REACTOR
Education
Training on Siloette reactor and associated simulators at the Grenoble Nuclear Research Centre, 12:15993 (RA;XA)
Reactor Simulators
Training on Siloette reactor and associated simulators at the Grenoble Nuclear Research Centre, 12:15993 (RA;XA)

SILVER
Adsorption
Adsorption of Ag on Ge(100)-(2 x 1), 12:16315 (J;GB)
Argon 40 Reactions
Study of cluster emission by excited compound nuclei, 12:17293 (R;SU;In Russian)
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Helium 3 Reactions
Study of cluster emission by excited compound nuclei, 12:17293 (R;SU;In Russian)
Physical Radiation Effects
Radiation enhanced self diffusion in silver, 12:17336 (R;IN)
Self-Diffusion
Radiation enhanced self diffusion in silver, 12:17336 (R;IN)
Surface Properties
Modification of the properties of metal overlayers on Nb(110) and Ta(110), 12:16241 (R;US)

SILVER 110
Tracer Techniques
Radiation enhanced self diffusion in silver, 12:17336 (R;IN)

SILVER ISOTOPES
See also SILVER 110
Neon 20 Reactions
Evolution of the fusion like process around the Fermi energy, 12:17227 (R;FR)

SIMS
See MASS SPECTROSCOPY

SINGLE CRYSTALS
See MONOCRYSTALS

SINGLE PHOTON EMISSION COMPUTED TOMOGRAPHY
Collimators
Which collimator for SPECT with I-123 and CU-67, 12:16820 (J;US)
Gamma Cameras
Which collimator for SPECT with I-123 and CU-67, 12:16820 (J;US)
Scintillation Counters
Linearity and energy corrections for scintillation cameras used in quantitative single photon emission computed tomography, 12:16821 (J;US)

SITE CHARACTERIZATION
Manuals
Site characterization field manual for near surface geologic disposal of low-level radioactive waste, 12:15422 (R;US)
Water Quality
1986 annual water quality data report for the Waste Isolation Pilot Plant, 12:15488 (R;US)

SITE SELECTION
Evaluation
Technical review of US Department of Energy draft area recommendation report for the crystalline repository project, 12:15421 (R;US)

SITES (REACTOR)
See REACTOR SITES

SIZEWELL NUCLEAR POWER STATION B
See SIZEWELL-B REACTOR

SIZEWELL-B REACTOR
Sizewell, Suffolk, USA
Planning
Probabilistic safety analysis for Sizewell B - Proof of Evidence, established on behalf of the Friends of the Earth, London, within the framework of the Sizewell B Power Station Public Inquiry, 12:16036 (R;DE;In German, English)

SKIN
Beta Dosimetry
Beta-particle dosimetry, 12:16863 (RA;US)
Infrared Spectra
Study of infra-red radiation characteristics: 2, Effect of infra-red radiation heating on the human body, 12:16883 (TG;GB)

SKYRMIONS
See SOLITONS

SLAGS
Viscosity
Fundamental studies on mineral matter behavior in ash-agglomerating coal gasifiers, 12:15271 (R;US)

SLC
See STANFORD LINEAR COLLIDER

SLOWPOKE REACTOR (TORONTO)
See SLOWPOKE-TORONTO REACTOR

SLOWPOKE TYPE REACTORS
See also SLOWPOKE-TORONTO REACTOR
Activation Analysis
Application of the Miniature Neutron Source Reactor, 12:15989 (RA;XA)
Education
MNSR - A satisfactory tool for training and teaching (Miniature Neutron Source Reactor), 12:15990 (RA;XA)
Reactor Control Systems
Control system for the MNSR (Miniature Neutron Source Reactor), 12:15958 (RA;XA)
Uses
MNSR Reactor (Miniature Neutron Source Reactor), 12:15988 (RA;XA)

SLOWPOKE-TORONTO REACTOR
Specifications
Slowpoke-2: Laboratory reactor for neutron irradiation, 12:15987 (RA;XA)
Uses
Slowpoke-2: Laboratory reactor for neutron irradiation, 12:15987 (RA;XA)

SLUDGES
See also SEWAGE SLUDGE

Biochemical Oxygen Demand
Pulp and paper industry energy impacts through implementation of biotechnologies, 12:16224 (BA;US)
Biodegradation
Pulp and paper industry energy impacts through implementation of biotechnologies, 12:16224 (BA;US)
SLUGS (FUEL)
See FUEL RODS
SLURRIES
See also FUEL SLURRIES
Calorimetry
Off-gas chemistry study of melter feed by Springborn Laboratories (Sludge-only and sludge-precipitate feed samples), 12:15425 (R;US)
Fluid Flow
Fluidization mechanisms in slurry flows: Quarterly report, 12:16474 (R;US)
Infrared Spectra
Off-gas chemistry study of melter feed by Springborn Laboratories (Sludge-only and sludge-precipitate feed samples), 12:15425 (R;US)
Pyrolysis
Off-gas chemistry study of melter feed by Springborn Laboratories (Sludge-only and sludge-precipitate feed samples), 12:15425 (R;US)
Pyrolysis Products
Off-gas chemistry study of melter feed by Springborn Laboratories (Sludge-only and sludge-precipitate feed samples), 12:15425 (R;US)
Thermal Gravimetric Analysis
Off-gas chemistry study of melter feed by Springborn Laboratories (Sludge-only and sludge-precipitate feed samples), 12:15425 (R;US)
SLURRIES (FUEL)
See FUEL SLURRIES
SMOKATRON
See ELECTRON-RING ACCELERATORS
SMOKES
Air Pollution
Atmospheric-dispersion index for prescribed burning. Forest Service research paper, 12:16728 (R;US)
SMP DEVICES
See SCANNING MEASURING PROJECTORS
SODIUM
Absorption
Study of high temperature removal of alkali of a pressurized gasification system: Final report, 12:15276 (R;US)
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Removal
Complete sodium removal from equipment, 12:15860 (J;US)
SODIUM IODIDE DETECTORS
See NAI DETECTORS
SODIUM SULFIDES
Corrosive Effects
The corrosion of metals and alloys by sodium polysulfide melts at 350°C, 12:16253 (R;US)
SODIUM-SULFUR BATTERIES
Materials Testing
The corrosion of metals and alloys by sodium polysulfide melts at 350°C, 12:16253 (R;US)
SOILS
Acidification
Influence of water running down the stem of trees on the chemical soil characteristics and low vegetation in populations of old beech-trees in different forest stands, 12:16904 (R;DE;In German)
Compacting
Review of current research into soil decontamination and volume reduction techniques for purposes of transportation and disposal, 12:15517 (RA;US)
Decontamination
Determination of U-238, Ra-226, and Th-232 by gamma-ray spectrometry in unprocessed soil samples, 12:15524 (RA;US)
Review of current research into soil decontamination and volume reduction techniques for purposes of transportation and disposal, 12:15517 (RA;US)
Depth Dose Distributions
Dose rate conversion factors, 12:17335 (J;US)
Land Pollution
Influence of water running down the stem of trees on the chemical soil characteristics and low vegetation in populations of old beech-trees in different forest stands, 12:16904 (R;DE;In German)
Photon Transport
Dose rate conversion factors, 12:17335 (J;US)
Physical Properties
Physical properties of cultivated soils mixed with coal ash as ameliorant, 12:15309 (R;JP;In Japanese)
Radiation Monitoring
Analysis of uranium and thorium contaminated soils during a cleanup and interment operation, 12:15550 (RA;US)
Correlation between gamma radiation levels and soil radium concentrations at the Edgemont uranium mill site, 12:15549 (RA;US)
Gamma analysis of soil at SEFOR, a decommissioned reactor, 12:16000 (J;US)
In situ monitoring technique for determining post remedial action concentrations of radium in soil, 12:15525 (RA;US)
Radioactivity
Determination of U-238, Ra-226, and Th-232 by gamma-ray spectrometry in unprocessed soil samples, 12:15524 (RA;US)
Rapid estimation of ^{226}Ra in soil for the Grand Junction RASA/UMTRA Project, 12:15532 (RA;US)
Waste Processing
Waste/soil treatability studies for four complex industrial wastes: methodologies and results. Volume 1. Literature assessment, waste/soil characterization, loading-rate selection. Final report, 12:16221 (R;US)
Waste/soil treatability studies for four complex industrial wastes: methodologies and results. Volume 2. Waste loading impacts on soil degradation, transformation, and immobilization. Final report, 12:16222 (R;US)
SOIL-STRUCTURE INTERACTIONS
Benchmarks
SSI [soil-structure interactions] and structural benchmarks, 12:16005 (R;US)
SOLANUM
Oncogenic Transformations
Hypervirulence of Agrobacterium tumefaciens A281 is encoded in a region of pTiBo542 outside of T-DNA, 12:16803 (J;US)
SOLAR ABSORBERS
Power Density
Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain, 12:15621 (TG;FR)
SOLAR ACTIVITY
See also SOLAR FLARES
SOLAR PROMINENCES
SOLAR RADIO BURSTS
SOLAR WIND
SUNSPOTS
Solar-Geophysical Data Number 504, August 1986. Part 1 (prompt reports). Data for July 1986, June 1986, and late data, 12:17050 (R;US)
Solar-Geophysical Data Number 504, August 1986. Part 2 (comprehensive reports). Data for February 1986, 12:17051 (R;US)
Solar-Geophysical Data Number 505, September 1986. Part 1 (prompt reports). Data for August 1986, July 1986, and late data, 12:17052 (R;US)
Solar-Geophysical Data Number 505, September 1986. Part 2 (comprehensive reports). Data for March, and miscellanea, 12:17053 (R;US)
SOLAR ALPHA PARTICLES
Solar-Geophysical Data Number 505, September 1986. Part 2 (comprehensive reports). Data for March, and miscellanea, 12:17053 (R;US)
SOLAR BATTERIES
See SOLAR CELL ARRAYS

SOLAR CELL ARRAYS
Calibration
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program, 12:15608 (R;US)
Standards
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program, 12:15608 (R;US)
SOLAR CELLS

CONCENTRATOR SOLAR CELLS
SILICON SOLAR CELLS
Adhesives
Chemical bonding technology: Direct investigation of interfacial bonds, 12:15604 (R;US)
Calibration
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program, 12:15608 (R;US)
Electric Contacts
Environmental tests of metallization systems for terrestrial photovoltaic cells, 12:15603 (R;US)
Ink jet printing of silver metallization for photovoltaics: Final technical report for the period 10/1/84 through 9/30/86, 12:15607 (R;US)
Standards
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program, 12:15608 (R;US)
SOLAR CORONA
Configuration
Simultaneous solar maximum mission (SMM) and very large array observations of solar active regions. Annual report, 1 September 1985-30 October 1986, 12:17033 (R;US)
Magnetic Fields
Simultaneous solar maximum mission (SMM) and very large array observations of solar active regions. Annual report, 1 September 1985-30 October 1986, 12:17033 (R;US)
Plasma Heating
Coronal heating by magnetic tearing turbulence, 12:16948 (RA;CS)
SOLAR ENERGY
Economics
Renewable energy sources and their uses - application, potentials, economic aspects, 12:16183 (RA;DE;In German)
SOLAR FLARES
Solar-Geophysical Data Number 504, August 1986. Part 1 (prompt reports). Data for July 1986, June 1986, and late data, 12:17050 (R;US)
Solar-Geophysical Data Number 504, August 1986. Part 2 (comprehensive reports). Data for February 1986, 12:17051 (R;US)
Solar-Geophysical Data Number 505, September 1986. Part 1 (prompt reports). Data for August 1986, July 1986, and late data, 12:17052 (R;US)
Solar-Geophysical Data Number 505, September 1986. Part 2 (comprehensive reports). Data for March, and miscellanea, 12:17053 (R;US)
Gamma Spectrometers
Gamma-ray spectrometer experiment on the solar maximum mission satellite. Final report, 16 October 1984-15 April 1986, 12:17041 (R;US)
MAX '91: an advanced payload for the exploration of high energy processes on the active sun, 12:17040 (R;US)
Ultraviolet Spectrometers
MAX '91: an advanced payload for the exploration of high energy processes on the active sun, 12:17040 (R;US)
X-Ray Spectra
Solar flare x-ray polarimetry. Final scientific report, 1 April 1984-30 September 1986, 12:17034 (R;US)
SOLAR MODELS
See STAR MODELS
SOLAR NEUTRINOS
Prior to July, 1975 information was indexed to NEUTRINOS.
Neutrino Detection
Solar neutrino experiments, 12:17106 (RA;CS)
SOLAR ONE POWER PLANT
See BARSTOW SOLAR PILOT PLANT
SOLAR PROMINENCES
Solar-Geophysical Data Number 504, August 1986. Part 2 (comprehensive reports). Data for February 1986, 12:17051 (R;US)
Solar-Geophysical Data Number 505, September 1986. Part 2 (comprehensive reports). Data for March, and miscellanea, 12:17053 (R;US)
SOLAR PROTON EVENTS
See SOLAR PROTONS
SOLAR PROTONS
Prior to July, 1975 information was indexed to PROTONS.
Solar-Geophysical Data Number 505, September 1986. Part 2 (comprehensive reports). Data for March, and miscellanea, 12:17053 (R;US)
SOLAR RADIATION
Data
New England solar energy atlas, 12:15596 (R;US)
Diffusion
Light diffusion through clouds and haze, 12:16698 (J;US)
Radiowave Radiation
Solar-Geophysical Data Number 505, September 1986. Part 1 (prompt reports). Data for August 1986, July 1986, and late data, 12:17052 (R;US)
Resource Assessment
The SERI Resource Assessment Project's plan for collecting spectral-solar-irradiance data, 12:15597 (R;US)
Velocity
Spectroscopic planetary detection, 12:17019 (RA;US)
X Radiation
Solar-Geophysical Data Number 504, August 1986. Part 2 (comprehensive reports). Data for February 1986, 12:17051 (R;US)
Solar-Geophysical Data Number 505, September 1986. Part 2 (comprehensive reports). Data for March, and miscellanea, 12:17053 (R;US)
SOLAR RADIO BURSTS
Solar-Geophysical Data Number 505, September 1986. Part 2 (comprehensive reports). Data for March, and miscellanea, 12:17053 (R;US)
SOLAR REFLECTORS
Erosion
Effect of hard particle impacts on the atomic oxygen survivability of reflector surfaces with transparent protective overcoats, 12:15624 (R;US)
Oxidation
Effect of hard particle impacts on the atomic oxygen survivability of reflector surfaces with transparent protective overcoats, 12:15624 (R;US)
SOLAR SYSTEM
Rings
Research in planetary astronomy at Palomar Observatory, 12:16990 (RA;US)
SOLAR SYSTEM EVOLUTION
Stellar upper mass limit in an OB association and implications for cosmic rays and cosmic abundances, 12:16938 (RA;US)
SOLAR WATER HEATERS
Performance Testing
In-situ performance of solar water heaters: a testing programme. Final report, 12:15623 (R;US)
SOLAR WIND
Solar-Geophysical Data Number 505, September 1986. Part 2 (comprehensive reports). Data for March, and miscellanea, 12:17053 (R;US)
SOLID CLUSTERS
Chemical Reactions
Gas-phase chemical reactions of transition metal clusters with simple molecules, 12:16401 (R;US)
SOLID FUELS
See also MIXED OXIDE FUELS
Mathematical Models
Mathematical simulation of fuel materials swelling according to a quasistatic void model, 12:16331 (R;SU;In Russian)
Swelling
Mathematical simulation of fuel materials swelling according to a quasistatic void model, 12:16331 (R;SU;In Russian)

SOLID STATE LASERS

Accuracy
Monochromator wavelength measurement device with six figure accuracy, 12:16471 (BA;US)
Laser Materials
Red laser initiative at Los Alamos, 12:16469 (BA;US)
Sustained performance of a 100 W, 240 Hz alexandrite laser, 12:16470 (BA;US)
Transparent glass ceramics: Laser prospects, 12:16472 (BA;US)
Metering
Monochromator wavelength measurement device with six figure accuracy, 12:16471 (BA;US)
Optical Pumping
Red laser initiative at Los Alamos, 12:16469 (BA;US)
Parametric Analysis
Sustained performance of a 100 W, 240 Hz alexandrite laser, 12:16470 (BA;US)
Performance
ICF drivers: A comparison of some new entries and old standbys, 12:17556 (J;US)
Sustained performance of a 100 W, 240 Hz alexandrite laser, 12:16470 (BA;US)
Wavelengths
Monochromator wavelength measurement device with six figure accuracy, 12:16471 (BA;US)
SOLID STATE PHYSICS
BARC
Annual report of the Nuclear Physics Division [for] period ending December 31, 1982, 12:17190 (R;IN)
Research Programs
Annual report of the Nuclear Physics Division [for] period ending December 31, 1982, 12:17190 (R;IN)
SOLID WASTES
Combustion Products
Characterization of stack emissions from municipal refuse-to-energy systems. Final report, 12:16715 (R;US)
Waste Disposal
Alternative methods to manage waste salt from repository excavation in the Deaf Smith County and Swisher County locations, Texas: A scoping study: Technical report (Salt and salt-laden material), 12:15407 (R;US)
SOLIDS
Atom Transport
Chemical potential in a stressed solid, 12:17341 (R;US)
Electron Beams
Collective excitation of a target by high-density electron beam, 12:17308 (R;SU;In Russian)
Pneumatic Transport
Advanced research in instrumentation and control technology: Capacitance flowmeter, 12:15273 (R;US)
Pipe and bend erosion by pneumatic transport of solids at high temperature: Quarterly report, September-November 1986, 12:15324 (R;US)
Thermodynamic Activity
Chemical potential in a stressed solid, 12:17341 (R;US)
SOLITONS
Astrophysics
Solitons in astrophysics, 12:17405 (RA;CS)
Nonlinear Problems
Algebraic construction of soliton solutions related to sl(2,R) algebra, 12:17364 (RA;SU;In Russian)
Universe
Algebraic construction of soliton solutions related to sl(2,R) algebra, 12:17364 (RA;SU;In Russian)
SOLUTES
Transport
Interpretation of the convergent-flow tracer tests conducted in the Culebra dolomite at the H-3 and H-4 hydropads at the Waste Isolation Pilot Plant (WIPP) site, 12:15449 (R;US)
SOLVATED ELECTRONS
Hydration
Thermodynamic properties of hydrated electron, 12:16427 (R;FR;In French)
SOLVENT EXTRACTION
Fluorescence Spectroscopy
Laser light-scattering and laser fluorescence studies of solvent extraction systems, 12:16384 (R;US)
Laser Spectroscopy
Laser light-scattering and laser fluorescence studies of solvent extraction systems, 12:16384 (R;US)
SONDES
See PROBES
SOOT
Monitoring
Conditional sampling for fuel and soot in CARS thermometry, 12:16434 (BA;US)
Production
Conditional sampling for fuel and soot in CARS thermometry, 12:16434 (BA;US)
Raman Spectra
Conditional sampling for fuel and soot in CARS thermometry, 12:16434 (BA;US)
SORGHUM
Carbon Dioxide Fixation
Effect of carbon dioxide on sorghum yield, root growth, and water use, 12:16906 (J;NL)
Plant Growth
Effect of carbon dioxide on sorghum yield, root growth, and water use, 12:16906 (J;NL)
SOURCE ROCKS
Activation Analysis
Low radioactivity spectral gamma calibration facility, 12:15347 (BA;US)
Gamma Logging
Low radioactivity spectral gamma calibration facility, 12:15347 (BA;US)

SPENT FUEL CASKS
Design
Effects of high burnup on spent-fuel casks, 12:15910 (J;US)
Fluid Flow
Finite difference solution procedure for convection-diffusion problems in irregular geometries, 12:16480 (J;US)
Heat Transfer
Finite difference solution procedure for convection-diffusion problems in irregular geometries, 12:16480 (J;US)
Performance Testing
Spent-fuel transportation - a success story, 12:15401 (J;US)
Research Programs
Cask technology program activities, 12:16446 (R;US)
Testing
Virginia Power and Department of Energy spent fuel transportation experience, 12:15397 (R;US)
SPENT FUEL ELEMENTS
Corrosion Products
Preliminary characterization of radioactive crud for design of dry spent-fuel handling facilities, 12:15402 (J;US)
Crack Propagation
Behavior of breached pressurized water reactor spent-fuel rods in an air atmosphere between 250 and 360°C, 12:15400 (J;US)
Oxidation
Behavior of breached pressurized water reactor spent-fuel rods in an air atmosphere between 250 and 360°C, 12:15400 (J;US)
Post-Irradiation Examination
Qualification of an LWBR-irradiated fuel assay gauge, 12:15864 (J;US)
Road Transport
Virginia Power and Department of Energy spent fuel transportation experience, 12:15397 (R;US)
Stress Corrosion
Behavior of breached pressurized water reactor spent-fuel rods in an air atmosphere between 250 and 360°C, 12:15400 (J;US)
Temperature Effects
Behavior of breached pressurized water reactor spent-fuel rods in an air atmosphere between 250 and 360°C, 12:15400 (J;US)
Transport
Spent-fuel transportation - a success story, 12:15401 (J;US)
SPENT FUEL STORAGE
See also MONITORED RETRIEVABLE STORAGE
Dry Storage
Preliminary characterization of radioactive crud for design of dry spent-fuel handling facilities, 12:15402 (J;US)
Fuel Racks
Seismic behavior of spent-fuel racks supported by aseismic bearing devices, 12:15403 (J;US)
Radionuclide Migration
Mass transfer of soluble species into backfill and rock, 12:15476 (J;US)
Underground Storage
Mass transfer of soluble species into backfill and rock, 12:15476 (J;US)
Prediction of temperatures in underground storage facilities for heat-generating materials at the Idaho Chemical Processing Plant, 12:15472 (J;US)
SPENT FUELS
Inventories
The Integrated Data Base program: An executive-level data base of spent fuel and radioactive waste inventories, projections, and characteristics, 12:15417 (R;US)
Leaching
Comparison of uranium release from spent fuel and unirradiated UO_2 in salt brine, 12:15447 (R;US)
Radioactivity
How well does ORIGEN predict spent LWR [Light Water Reactor] fuel characteristics, 12:15416 (R;US)
Reprocessing
Reprocessing fuel from the Southwest Experimental Fast Oxide Reactor at the Savannah River Plant, 12:15385 (R;US)
The application of electrorefining for recovery and purification of fuel discharged from the Integral Fast Reactor, 12:15383 (R;US)
SPENT SHALES
Chemical Composition
Assay products from Green River oil shale, 12:15373 (R;US)
Density
Assay products from Green River oil shale, 12:15373 (R;US)
Emission Spectroscopy
Quality of leachate from retorted oil shale wetted with treated process waters, 12:15375 (R;US)
Leaching
Quality of leachate from retorted oil shale wetted with treated process waters, 12:15375 (R;US)
SPHERES
Dielectric Properties
Excitations in small spherical particles, 12:17358 (R;US;In Spanish)
SPHEROMAK DEVICES
See also CTX SPHEROMAK
Currents
Measurement of the line tying current pattern in the proto S-1/C tilt stabilizing structure, 12:17446 (RA;US)
Design
Recent progress of S-1 experiments, 12:17439 (RA;US)
Electric Currents
Current drive by helicity injection in RFP's and spheromaks, 12:17459 (RA;US)
Electron Density
Summary of electron temperature and density measurements in the S-1 spheromak, 12:17444 (RA;US)

Electron Temperature
Summary of electron temperature and density measurements in the S-1 spheromak, 12:17444 (RA;US)
Energy
Internal magnetics of the S-1 Spheromaks, 12:17440 (RA;US)
Hydromagnetic Waves
Observation of Doppler shifts and applied magnetic disturbances in PS-3.5, 12:17457 (RA;US)
Ion Temperature
Observation of Doppler shifts and applied magnetic disturbances in PS-3.5, 12:17457 (RA;US)
Magnet Coils
Critical field index for passive coil stabilization of the shift instability, 12:17458 (RA;US)
Magnetic Field Configurations
Current drive by helicity injection in RFP's and spheromaks, 12:17459 (RA;US)
Equilibrium of the kink source experiment, 12:17456 (RA;US)
Generalized helicity and its time derivative, 12:17451 (RA;US)
Internal magnetics of the S-1 Spheromaks, 12:17440 (RA;US)
Introduction to the m = 1 helicity source, 12:17454 (RA;US)
Spontaneous generation of toroidal magnetic field during spheromak formation in a conical Theta-pinch, 12:17461 (RA;US)
Operation
Recent progress of S-1 experiments, 12:17439 (RA;US)
Plasma Confinement
Initial VUV spectroscopy results from S-1 spheromak, 12:17445 (RA;US)
Plasma Diagnostics
Initial VUV spectroscopy results from S-1 spheromak, 12:17445 (RA;US)
Measurements of radiated power from the S-1 spheromak, 12:17443 (RA;US)
Methods for examining the particle and energy confinement in S-1, 12:17442 (RA;US)
Plasma Guns
Equilibrium of the kink source experiment, 12:17456 (RA;US)
Introduction to the m = 1 helicity source, 12:17454 (RA;US)
Operation of the m = 1 helicity source, 12:17455 (RA;US)
Plasma Instability
Measurement of the line tying current pattern in the proto S-1/C tilt stabilizing structure, 12:17446 (RA;US)
Plasma Waves
Global magnetic fluctuations in S-1 spheromak plasmas and relaxation toward a minimum-energy state, 12:17441 (RA;US)
Power Losses
Measurements of radiated power from the S-1 spheromak, 12:17443 (RA;US)

SPICULES
See SOLAR PROMINENCES

SPIN GLASS STATE
Field Equations
Optimization by a computational neural net, 12:17343 (R;US)

SPIN-OFF

STACK DISPOSAL
Air Pollution
Characterization of stack emissions from municipal refuse-to-energy systems. Final report, 12:16715 (R;US)

STAINLESS STEEL-16-8-2
Fracture Properties
Fracture toughness of stainless steel welds, 12:16278 (R;US)
Welded Joints
Fracture toughness of stainless steel welds, 12:16278 (R;US)

STAINLESS STEEL-304
Compacting
Microstructural response of rapidly solidified 304 stainless steel powder to three consolidation techniques, 12:16269 (R;US)
Crack Propagation
BWR pipe crack remedies evaluation, 12:15764 (R;US)
Technical basis for normal water chemistry guidelines: Review of laboratory studies of water chemistry effects on SCC [stress corrosion cracking], 12:15766 (R;US)
Decontamination
Compilation of corrosion data on the CAN-DECON process: Volume 3, Influence of the CAN-DECON process on stress corrosion cracking: 1984 constant-extension-rate tests: Final report, 12:15948 (R;US)
Decontamination process for hot leg LMFBR components, 12:15852 (RA;US)
Fracture Mechanics
BWR pipe crack remedies evaluation, 12:15764 (R;US)

Intergranular Corrosion
Compilation of corrosion data on the CAN-DECON process: Volume 5, Influence of the CAN-DECON process on stress corrosion cracking: Summary of testing, 1984-1985: Final report, 12:15768 (R;US)
Laser Welding
Porosity decrease in laser welds of stainless steel using plasma control, 12:16322 (BA;US)
Microstructure
Microstructural response of rapidly solidified 304 stainless steel powder to three consolidation techniques, 12:16269 (R;US)
Reactor Materials
BWR pipe crack remedies evaluation, 12:15764 (R;US)
Compilation of corrosion data on the CAN-DECON process: Volume 5, Influence of the CAN-DECON process on stress corrosion cracking: Summary of testing, 1984-1985: Final report, 12:15768 (R;US)

STEAM GENERATORS
Availability
Evaluation of feedwater systems for reactor scram reduction, 12:15818 (J;US)
Cleaning
Secondary-side chemical cleaning of Oconee nuclear station steam generators, 12:15825 (J;US)
Control Systems
Palo Verde full-range feedwater control system operating experience, 12:15819 (J;US)
Corrosion
Review of secondary side tube degradation processes in PWR steam generators, 12:15812 (J;US)
Corrosion Protection
Condenser performance improvements, 12:15717 (RA;US)
Crevice Corrosion
Hideout and return of chloride salts in heated crevices prototypic of support plates in steam generators: Topical report, 12:15799 (R;US)
Feedwater
Babcock & Wilcox Company water chemistry guidelines for once-through steam generators and drum boilers, 12:15710 (RA;US)
Evaluation of feedwater systems for reactor scram reduction, 12:15818 (J;US)
Improvement in steam generator level control, 12:15817 (J;US)
Palo Verde full-range feedwater control system operating experience, 12:15819 (J;US)
Heat Transfer
Turbulence force correlation of PWR steam generator tube bundle flow, 12:15834 (J;US)
Use of the Chen boiling heat transfer correlation in once-through steam generator analysis, 12:16089 (J;US)
Hydraulics
Turbulence force correlation of PWR steam generator tube bundle flow, 12:15834 (J;US)
Use of the Chen boiling heat transfer correlation in once-through steam generator analysis, 12:16089 (J;US)
Inconel 600
Understanding and protecting steam generator materials, 12:15813 (J;US)
Leak Testing
Evaluation of sulfur hexafluoride and helium for steam generator leak location: Final report, 12:15771 (R;US)
Leaks
Acoustic leak detection in fossil fueled boilers, 12:15699 (RA;US)
Critical review of acoustic and acoustic emission leak detection in boilers, 12:15701 (RA;US)
Initial feasibility study of halogen tracer method for finding boiler tube leaks, 12:15703 (RA;US)
Mathematical Models
U-tube steam generator model for the DSNP language, 12:15831 (J;US)
Performance
Calculation of once-through steam generator performance using RELAP5/MOD2, 12:15833 (J;US)
Reliability
Evaluation of feedwater systems for reactor scram reduction, 12:15818 (J;US)
Steam generator vessel and feedwater line integrity issues, 12:15810 (J;US)
Ruptures
Calculation RTGV (Steam generator tube rupture), 12:16007 (R;FR;In French)
Stress Analysis
On-line boiler stress and condition analyzer, 12:15702 (RA;US)
Stress Corrosion
Primary side stress corrosion cracking and remedial measures, 12:15809 (J;US)

STEAM INJECTION
Additives
Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 45, Quarter ending December 31, 1985, 12:15353 (R;US)
Bench-Scale Experiments
Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 45, Quarter ending December 31, 1985, 12:15353 (R;US)

STEAM SYSTEMS
Modifications
Evaluating the safety of nuclear plant changes, 12:16112 (J;US)

Orsay synchrotron radiation sources complex, 12:16579 (RA;US)
Start-Up
Origins, and the construction, commissioning and operation of the SRS, 12:16574 (RA;US)
Present status of SOR-RING, 12:16578 (RA;US)
Synchrotron Radiation
Space-angular distribution of Synchrotron radiation power in electron storage rings with account of betatron oscillations, 12:16592 (R;SU;In Russian)
Uses
The Heidelberg test storage ring for heavy ions and its use for atomic physics, 12:16591 (R;US)
University-based user facilities: lessons from Tantalus and Aladdin, 12:16577 (RA;US)

STORAGE (SPENT FUEL)
See SPENT FUEL STORAGE

STORES
See COMMERCIAL BUILDINGS

STRAND BREAKS
Bioassay
Three methods to determine the yields of DNA double-strand breaks, 12:16858 (R;SU)

STRATEGIC DEFENSE INITIATIVE
See BALLISTIC MISSILE DEFENSE

STRATOSPHERE
Ambient Temperature
Seasonal tropospheric and stratospheric temperature anomalies for the Northern Hemisphere, 1958-1983, 12:16691 (R;US)
Monitoring
Description of data on the Nimbus 7 LIMS map archive tape: ozone and nitric acid, 12:16707 (R;US)

STREAK CAMERAS
Image Intensifiers
Utilisation of image intensifiers used in conjunction with streak cameras, 12:16670 (R;FR;In French)
Time Measurement
Streak camera and picosecond metrology of laser impulses running at high repetitive rates, 12:16602 (R;FR;In French)

STREAMER SPARK CHAMBERS
Data Acquisition Systems
TV event recorder, 12:16630 (R;SU;In Russian)
Spatial Resolution
Investigation of spatial resolution of plastic streamer tubes, 12:16635 (R;SU;In Russian)

STRING MODELS
Treating the interactions of extended particles through breaking and connection of strings.
String theory and holomorphic line bundles, 12:17180 (R;US)
Canonical Transformations
Baryon string model. Part 3. Quantum theory of single-mode configurations of three-string, 12:17361 (R;SU;In Russian)
Energy-Momentum Tensor
Energy-momentum tensor on a Riemann surface, 12:17183 (J;NL)
Fermions
Fermionic string model in spaces of Lie group, 12:17176 (R;SU;In Russian)
Lie Groups
Fermionic string model in spaces of Lie group, 12:17176 (R;SU;In Russian)
Quantization
Baryon string model. Part 3. Quantum theory of single-mode configurations of three-string, 12:17361 (R;SU;In Russian)
Symmetry Breaking
Low energy superstring theory, 12:17185 (BA;NL)
Topological Mapping
Thirring strings, 12:17184 (J;NL)

STRONTIUM
Emission Spectroscopy
Quality of leachate from retorted oil shale wetted with treated process waters, 12:15375 (R;US)

STRONTIUM 90
Geochemistry
Geochemistry of Ca, Sr, Ba and Ra sulfates in some deep brines from the Palo Duro basin, Texas, 12:15350 (J;US)

STRUCTURAL BUCKLING
See DEFORMATION

STRUCTURAL MATERIALS
See BUILDING MATERIALS

STRUCTURE (CRYSTAL)
See CRYSTAL STRUCTURE

STRUCTURE (MOLECULAR)
See MOLECULAR STRUCTURE

STRUCTURES (MECHANICS)
See MECHANICAL STRUCTURES

STYRENE
Chemical Preparation
The cogeneration of electrical energy and useful chemicals in a solid electrolyte reactor [Final technical report], 12:16420 (R;US)

SUBBITUMINOUS COAL
Combustion Kinetics
Single-particle combustion of Beulah lignite char, 12:15332 (BA;US)
Devolatilization
Low-rank coal research: Quarterly technical progress report for the period April-June 1986, 12:15310 (R;US)
Oxidation
Effects of coal structure on pulverized coal combustion processes: Quarterly technical progress report No. 5 for the period September 1, 1986 to 31 December 1986, 12:15303 (R;US)
Pyrolysis
Low-rank coal research: Quarterly technical progress report for the period April-June 1986, 12:15310 (R;US)
Quantitative Chemical Analysis
New methodology for the rapid elemental analysis of coal: Final report for the 1985-86 SOMED [School of Mines and Energy Development] project year, 12:15306 (R;US)
Surface Area
Effects of coal structure on pulverized coal combustion processes: Quarterly technical progress report No. 5 for the period September 1, 1986 to 31 December 1986, 12:15303 (R;US)

SUBSIDENCE (GROUND)
See GROUND SUBSIDENCE

SUBSURFACE STRUCTURES
Background Radiation
Investigation of backgrounds of scintillation and semiconductor detectors in the underground lowbackground laboratory of the Institute for Nuclear Research, the Ukrainian Academy of Sciences, 12:16644 (R;SU;In Russian)

SUBURBS
See URBAN AREAS

SUDDEN IONOSPHERIC DISTURBANCE
Solar-Geophysical Data Number 505, September 1986. Part 1 (prompt reports). Data for August 1986, July 1986, and late data, 12:17052 (R;US)

SULFATES
See also LITHIUM SULFATES
MANGANESE SULFATES
Atmospheric Chemistry
Sensitivity analysis of RELMAP (Regional Lagrangian Model of Air Pollution) involving fine and coarse particulate matter, 12:16721 (R;US)
Reduction
Anaerobic chitin degradation as a carbon and hydrogen source for sulfate reduction and methanogenesis in salt marsh bacteria, 12:16826 (RA;US)

SULFIDES
See also HYDROGEN SULFIDES
SODIUM SULFIDES
Biological Effects
Diel vertical movements of bacteria in intertidal streams of Sippewissett Marsh, 12:16833 (RA;US)
Corrosive Effects
Fundamental corrosion characterization of high-strength titanium alloys, 12:16320 (BA;US)

SULFUR
Electronic Structure
Angle-resolved photoemission extended fine structure, 12:16323 (BA;US)
Photoemission
Angle-resolved photoemission extended fine structure, 12:16323 (BA;US)
X-Ray Spectra
Angle-resolved photoemission extended fine structure, 12:16323 (BA;US)
SULFUR 32 REACTIONS
Incomplete Fusion Reactions
Fusion measurements in light and medium mass heavy-ion reactions: Progress report for the period of June 1, 1986-May 31, 1987, 12:17209 (R;US)
SULFUR 32 TARGET
Neutron Reactions
Neutron scattering on light even-even nuclei, 12:17214 (RA;CS)
SULFUR 38
Secondary Beams
Production of secondary radioactive beams from 44 MeV/u Ar projectiles, 12:16559 (R;FR)
SULFUR COMPOUNDS
See also SULFATES
SULFIDES
SULFUR FLUORIDES
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
SULFUR DIOXIDE
Air Pollution Control
Comprehensive report to Congress: Clean Coal Technology program: Tidd PFBC [pressurized fluidized-bed combustion] demonstration project, 12:15327 (R;US)
Atmospheric Chemistry
Sensitivity analysis of RELMAP (Regional Lagrangian Model of Air Pollution) involving fine and coarse particulate matter, 12:16721 (R;US)
Auger Electron Spectroscopy
Photoionization of atoms and small molecules using synchrotron radiation, 12:17082 (R;US)
Emission
Estimated monthly emissions of sulfur dioxide and oxides of nitrogen for the 48 contiguous states, 1975-1984: Volume 2, Supporting data bases and monthly SO_2 and NO/sub x/ estimates by state, 12:16770 (R;US)
Forecasting
Calculation of emission scenarios for passenger cars in the Netherlands, 12:16208 (R;NL;DU)
Photoelectron Spectroscopy
Photoionization of atoms and small molecules using synchrotron radiation, 12:17082 (R;US)
SULFUR FLUORIDES
Auger Electron Spectroscopy
Photoionization of atoms and small molecules using synchrotron radiation (SF_6, SiF_4), 12:17082 (R;US)
Electrolysis
Process for measuring degradation of sulfur hexafluoride in high voltage systems, 12:16422 (P;US)
Photoelectron Spectroscopy
Photoionization of atoms and small molecules using synchrotron radiation (SF_6, SiF_4), 12:17082 (R;US)
SULFUR HYDRIDES
See HYDROGEN SULFIDES
SULFUR SULFIDES
See SULFUR
SUM RULES
Giant Resonance
Isoscalar quadratic energy weighted sum rules and quadrupole moment of giant quadrupole resonance, 12:17285 (R;JP)
Quadrupole Moments
Isoscalar quadratic energy weighted sum rules and quadrupole moment of giant quadrupole resonance, 12:17285 (R;JP)
SUN
Oscillations
Helioseismology, 12:17046 (R;DK)
Solar oscillations, 12:17044 (R;DK)
SUNSPOTS
Solar-Geophysical Data Number 504, August 1986. Part 1 (prompt reports). Data for July 1986, June 1986, and late data, 12:17050 (R;US)
Solar-Geophysical Data Number 505, September 1986. Part 1 (prompt reports). Data for August 1986, July 1986, and late data, 12:17052 (R;US)
Solar records: the Wolf sunspot index and umbral/penumbral ratio, 12:16694 (R;US)
SUPER HIGH FREQUENCY RADIATION
See RADIOWAVE RADIATION
SUPERCOMPUTERS
Algorithms
A pipelined solution method of tridiagonal linear equation systems, 12:17672 (BA;US)
Multiprocessor Jacobi algorithms for dense symmetric eigenvalue and singular value decompositions, 12:17668 (BA;US)
Optimizing matrix operations on a parallel multiprocessor with a hierarchical memory system, 12:17669 (BA;US)
The role of better algorithms, 12:17680 (BA;US)
Computer Architecture
Execution of parallel loops on parallel processor systems, 12:17666 (BA;US)
Multiprocessor Jacobi algorithms for dense symmetric eigenvalue and singular value decompositions, 12:17668 (BA;US)
Optimizing matrix operations on a parallel multiprocessor with a hierarchical memory system, 12:17669 (BA;US)
SK-banyans: A unified class of banyan networks, 12:17671 (BA;US)
The New York University Ultracomputer, 12:17676 (BA;US)
The role of better algorithms, 12:17680 (BA;US)
Computer Calculations
The Computational Physics Program of the National MFE Computer Center, 12:17417 (R;US)
Computer Codes
A pipelined solution method of tridiagonal linear equation systems, 12:17672 (BA;US)
Computation: The nexus of nuclear weapon development, 12:17677 (BA;US)
Execution of parallel loops on parallel processor systems, 12:17666 (BA;US)
Parallel structuring of control and resources management systems for parallel programs, 12:17670 (BA;US)
The role of better algorithms, 12:17680 (BA;US)
Control Theory
Parallel structuring of control and resources management systems for parallel programs, 12:17670 (BA;US)
Data-Flow Processing
A pipelined solution method of tridiagonal linear equation systems, 12:17672 (BA;US)
Design
Japanese supercomputer initiatives: Challenge and response, 12:17675 (BA;US)
SK-banyans: A unified class of banyan networks, 12:17671 (BA;US)
The New York University Ultracomputer, 12:17676 (BA;US)
Distributed Data Processing
Distributing hot-spot addressing in large-scale multiprocessors, 12:17673 (BA;US)
Efficiency
Distributing hot-spot addressing in large-scale multiprocessors, 12:17673 (BA;US)
SK-banyans: A unified class of banyan networks, 12:17671 (BA;US)
Executive Codes
Operating systems and basic software for high-performance parallel architecture, 12:17679 (BA;US)

Market
Japanese supercomputer initiatives: Challenge and response, 12:17675 (BA;US)
Memory Devices
Optimizing matrix operations on a parallel multiprocessor with a hierarchical memory system, 12:17669 (BA;US)
The effectiveness of combining in shared memory parallel computers in the presence of 'hot spots', 12:17674 (BA;US)
Parallel Processing
Compiler generated synchronization for DO loops, 12:17664 (BA;US)
Operating systems and basic software for high-performance parallel architecture, 12:17679 (BA;US)
Optimizing matrix operations on a parallel multiprocessor with a hierarchical memory system, 12:17669 (BA;US)
Parallel structuring of control and resources management systems for parallel programs, 12:17670 (BA;US)
Processor self-scheduling for multiple-nested parallel loops, 12:17665 (BA;US)
SK-banyans: A unified class of banyan networks, 12:17671 (BA;US)
The effectiveness of combining in shared memory parallel computers in the presence of 'hot spots', 12:17674 (BA;US)
Performance
Japanese supercomputer initiatives: Challenge and response, 12:17675 (BA;US)
Plasma Simulation
The Computational Physics Program of the National MFE Computer Center, 12:17417 (R;US)
Programming
Caltech Concurrent Computation Program: Annual report, 1985-86, 12:17645 (R;US)
Research Programs
An overview of computing at Los Alamos, 12:17678 (BA;US)
The New York University Ultracomputer, 12:17676 (BA;US)
Synchronization
Compiler generated synchronization for DO loops, 12:17664 (BA;US)
Translators
Compiler generated synchronization for DO loops, 12:17664 (BA;US)
Uses
Supercomputers and magnetic fusion energy, 12:17624 (BA;US)
Vector Processing
Toward efficient implementations of PCCG (preconditioned conjugate gradient) methods on vector supercomputers. Technical report, 12:17639 (R;US)
SUPERCONDUCTING JUNCTIONS
See also JOSEPHSON JUNCTIONS
Critical Field
Nature of coupling and dimensional crossover in superconducting multilayers, 12:17354 (R;US)
SUPERCONDUCTING MAGNETS
Construction
Design study and supporting experiments for an axially symmetric anchor for a tandem mirror, 12:17537 (J;US)
Design
Design study and supporting experiments for an axially symmetric anchor for a tandem mirror, 12:17537 (J;US)
MINIMARS choke coil design, 12:17607 (J;US)
Sliding joint and bond development program for the Alcator C-Mod toroidal field coils, 12:17608 (J;US)
The differential geometry of twisted coil windings, 12:17609 (J;US)
Differential Geometry
The differential geometry of twisted coil windings, 12:17609 (J;US)
Explosion Welding
Sliding joint and bond development program for the Alcator C-Mod toroidal field coils, 12:17608 (J;US)
Fabrication
The differential geometry of twisted coil windings, 12:17609 (J;US)
Failures
Survey of selected magnet failures and accidents, 12:17550 (J;US)
Joints
Sliding joint and bond development program for the Alcator C-Mod toroidal field coils, 12:17608 (J;US)
Materials Testing
Superconducting magnet radiation effects in fusion reactors, 12:17575 (J;US)
Mechanical Vibrations
Stability and vibration of internal windings of superconducting solenoid magnets, 12:17610 (J;US)
Physical Radiation Effects
Superconducting magnet radiation effects in fusion reactors, 12:17575 (J;US)
Quenching
Heater induced quenches in SSC [Superconducting Super Collider] model dipoles, 12:16565 (R;US)
Stability
Stability and vibration of internal windings of superconducting solenoid magnets, 12:17610 (J;US)
Stresses
Calculation of strain-stressed state of the tyre system of superconducting dipole magnets, 12:16568 (R;SU;In Russian)
Supports
Deflection analysis for an SSC [Superconducting Super Collider] dipole magnet with two external supports, 12:16551 (R;US)
Transients
On the stability of superconducting systems under slightly chance thermal perturbations, 12:17355 (R;SU;In Russian)
Uses
Superconducting materials, 12:16318 (BA;US)
SUPERCONDUCTING QUANTUM INTERFERENCE DEVI
See SQUID DEVICES
SUPERCONDUCTING SUPER COLLIDER
Beam Luminosity
Extending the reach of the SSC [Superconducting Super Collider], 12:16503 (R;US)
Radiation Detectors
Report of the working group on detector simulation, 12:16594 (R;US)
Superconducting Magnets
Deflection analysis for an SSC [Superconducting Super Collider] dipole magnet with two external supports, 12:16551 (R;US)
SUPERCONDUCTORS
Chemical Composition
Ambient-pressure organic superconductor, 12:16416 (P;US)
Thermal Conductivity
Superconducting materials, 12:16318 (BA;US)
SUPERCRITICAL FLOW
See TURBULENT FLOW
SUPERGRAVITY
Compactification
General dimensional reduction of ten-dimensional supergravity and superstring, 12:17388 (J;NL)
Multiplets
Scalar multiplets in N=2 supergravity, 12:17360 (R;SU;In Russian)
Reviews
Supergravity: The basic and beyond, 12:17394 (BA;US)
SUPERLATTICES
Crystallography
Ion beam channeling in superlattices, 12:16366 (BA;US)
Elasticity
Elastic properties of superlattices (Nb/Cu; Au/Cr; Mo/Ni), 12:16260 (R;US)
Ion Channeling
Ion beam channeling in superlattices, 12:16366 (BA;US)
SUPERNOVA REMNANTS
Charge States
Observational study of ion-electron equilibration and of cloud evaporation in supernova remnants under the HEAO-2 guest investigator program. Final project report, 1 June 1985-30 September 1986, 12:17036 (R;US)
Clouds
Observational study of ion-electron equilibration and of cloud evaporation in supernova remnants under the HEAO-2 guest

investigator program. Final project report, 1 June 1985-30 September 1986, 12:17036 (R;US)

SUPERSYMMETRY
Supersymmetry and model building, 12:17179 (R;US)
Instantons
Instantons versus SUSY, 12:17165 (R;SU)
Postulated Particles
On (quasi) stable gluino, 12:17143 (R;SU)
Symmetry Breaking
Instantons versus SUSY, 12:17165 (R;SU)

TAR SANDS
See OIL SANDS
TARAPUR-1 REACTOR
Boisar, Maharastra, India

Fission Product Release
Experience in monitoring the BWR [boiling water reactor] fuel behaviour and fission product releases during off normal conditions, 12:16035 (R;DE)
Fuel Rods
Experience in monitoring the BWR [boiling water reactor] fuel behaviour and fission product releases during off normal conditions, 12:16035 (R;DE)
Reactor Accidents
Tarapur dual cycle BWR - analysis of steam generator bypass incident, 12:15762 (R;IN)
TARAPUR-2 REACTOR
Boisar, Maharastra, India
Fission Product Release
Experience in monitoring the BWR [boiling water reactor] fuel behaviour and fission product releases during off normal conditions, 12:16035 (R;DE)
Fuel Rods
Experience in monitoring the BWR [boiling water reactor] fuel behaviour and fission product releases during off normal conditions, 12:16035 (R;DE)
Reactor Accidents
Tarapur dual cycle BWR - analysis of steam generator bypass incident, 12:15762 (R;IN)
TARGET CHAMBERS
Temperature Measurement
Setup for studying targets irradiated by high density proton beam, 12:16554 (R;SU;In Russian)
TATB
Detonations
Short pulse initiation of detonation in a TATB explosive, 12:16680 (BA;US)
TEARING INSTABILITY
Magnetic Field Reversal
Reverse flow and current filamentation in the nonlinear tearing mode, 12:17403 (RA;CS)
TECHNOLOGY TRANSFER
Brookhaven National Laboratory: Technology transfer report, Fiscal year 1983, 12:16158 (R;US)
TELEMETRY
Advanced sensors, telecommunications and data processing: Technological spin-offs from the Strategic Defense Initiative, 12:17632 (R;US)
TELESCOPE COUNTERS
Development of an universal particle telescope with large dynamics for light and medium heavy fragments, 12:16612 (R;DE;In German)
TELLURIUM 132
Computerized Simulation
Release of tellurium and caesium from UO/sub 2/ in LWR fuel rods during irradiation, 12:15970 (BA;US)
Structural Chemical Analysis
Release of tellurium and caesium from UO/sub 2/ in LWR fuel rods during irradiation, 12:15970 (BA;US)
TEMPERATURE (AMBIENT)
See AMBIENT TEMPERATURE
TENNESSEE
Oil Shale Deposits
Identification of organic compounds in the bitumen of Chattanooga oil shale, 12:15374 (J;US)
TENNESSEE VALLEY AUTHORITY
Fossil-Fuel Power Plants
Cycle chemistry: sampling points and frequencies, presentation, and use of analytical data, 12:15725 (RA;US)
TERRESTRIAL ECOSYSTEMS
Mapping
Major world ecosystem complexes ranked by carbon in live vegetation: a database, 12:16710 (R;US)
Soil Chemistry
Forms in which aluminium is bound and equilibria of aluminium in gravitational water in acid soils, 12:16775 (R;DE;In German)
TERTIARY RECOVERY
See ENHANCED RECOVERY
TEST FACILITIES
See also FELIX FACILITY
TRITIUM SYSTEMS TEST ASSEMBLY
Design
Fluidization mechanisms in slurry flows: Quarterly report, 12:16474 (R;US)
Diagnostic Techniques
Testing and evaluation of heat recovery/seed recovery: Annual technical progress report, april 1981-March 1982, 12:16186 (R;US)
Materials Testing
Testing and evaluation of heat recovery/seed recovery: Annual technical progress report, april 1981-March 1982, 12:16186 (R;US)
Reactor Safety Experiments
TRAC analysis of upper plenum thermal-hydraulic phenomena in the slab core test facility, 12:16088 (J;US)
TEST FAST BREEDER REACTOR KALPAKKAM
See KALPAKKAM LMFBR REACTOR
TETRAHYDROFURAN
Mutagen Screening
Chemical characterization of materials from a close-coupled catalytic-catalytic two-stage coal liquefaction process, 12:15293 (RA;US)
TETRAHYDRONAPHTHALENE
See TETRALIN
TETRALIN
Density
Viscosity of synfuel compounds and mixtures: Fifth quarterly progress report, 10/1/86-12/31/86, 12:15302 (R;US)
Viscosity
Viscosity of synfuel compounds and mixtures: Fifth quarterly progress report, 10/1/86-12/31/86, 12:15302 (R;US)
TEVATRON
See FERMILAB TEVATRON
TEXACO GASIFICATION PROCESS
Pilot Plants
Pilot plant evaluation of Illinois No. 6 and Pittsburgh No. 8 coal for the Texaco coal gasification process: Final report, 12:15288 (R;US)
Raw Materials
Pilot plant evaluation of Illinois No. 6 and Pittsburgh No. 8 coal for the Texaco coal gasification process: Final report, 12:15288 (R;US)
TEXAS
Brines
Geochemistry of Ca, Sr, Ba and Ra sulfates in some deep brines from the Palo Duro basin, Texas, 12:15350 (J;US)
Salt Deposits
Alternative methods to manage waste salt from repository excavation in the Deaf Smith County and Swisher County locations, Texas: A scoping study: Technical report, 12:15407 (R;US)
Wind Power
Wind characteristics, northwest Texas region, 12:15634 (BA;US)
TEXAS EXPERIMENTAL TOKAMAK
See TEXT DEVICES
TEXT DEVICES
Beam Injection Heating
Injection and trapping of intense neutralized ion beams in closed magnetic configuration, 12:17481 (RA;US)
TFCX REACTORS
Research Programs
Demountable toroidal fusion core facility for toroidal physics optimization and fusion engineering research, 12:17586 (J;US)
TFTR DEVICE
See TFTR TOKAMAK
TFTR REACTORS
See TFTR TOKAMAK
TFTR TOKAMAK
Basements
TFTR basement radiation fluence calculations and comparisons with measurements, 12:17571 (J;US)
Breeding Blankets
Lithium Blanket Module (LBM) dosimetry measurements at the LOTUS 14-MeV neutron source facility, 12:17526 (J;US)

Overview of the TFTR Lithium Blanket Module program, 12:17523 (J;US)
Electrical Insulators
Development of large high-voltage pressure insulators for the Princeton TFTR [Tokamak Fusion Test Reactor] flexible transmission lines, 12:15760 (R;US)
Gamma Radiation
TFTR basement radiation fluence calculations and comparisons with measurements, 12:17571 (J;US)
Neutron Fluence
TFTR basement radiation fluence calculations and comparisons with measurements, 12:17571 (J;US)
Radiation Doses
TFTR offsite dose levels from fusion radiation and effluent releases, 12:17553 (J;US)
THERMAL DECOMPOSITION
See PYROLYSIS
THERMAL NEUTRONS
Gases
Difference equation of neutron thermalization in vibrational-nonequilibrium medium, 12:17311 (R;SU;In Russian)
Inelastic Scattering
Temperature dependence of the generalized frequency water spectrum, 12:17307 (R;SU;In Russian)
THERMAL POLLUTION (AIR)

FOSSIL-FUEL POWER PLANTS
NUCLEAR POWER PLANTS
REFUSE-FUELED POWER PLANTS
WOOD-FUEL POWER PLANTS
Blowers
Eddy current on-line monitoring for crack detection, 12:15706 (RA;US)
Compressors
Detection of turbomachine blading problems using on and off-line monitoring, 12:15689 (RA;US)
Corrosion
New approach for diagnostic monitoring of wear, erosion and corrosion in utility applications, 12:15704 (RA;US)
Cracks
Radiometric detection of cracks on stationary and moving surfaces, 12:15707 (RA;US)
Erosion
New approach for diagnostic monitoring of wear, erosion and corrosion in utility applications, 12:15704 (RA;US)
Feedwater Heaters
Leak detection by acoustic emission monitoring in power plant high pressure preheaters, 12:15700 (RA;US)
Gas Turbines
Detection of turbomachine blading problems using on and off-line monitoring, 12:15689 (RA;US)
Maintenance
Mechanitrack system, 12:15697 (RA;US)
Mechanical Vibrations
Laser doppler measurement of torsional vibrations, 12:15705 (RA;US)
Pumps
Eddy current on-line monitoring for crack detection, 12:15706 (RA;US)
San Diego Gas & Electric's vibration monitoring/reduction program, 12:15685 (RA;US)
Steam Generators
Critical review of acoustic and acoustic emission leak detection in boilers, 12:15701 (RA;US)
Steam Turbines
Acoustic emission monitoring of steam turbines: a review of progress, 12:15698 (RA;US)
Monitoring of steam turbine environments for detection of stress corrosion cracking, 12:15694 (RA;US)
On-line rotor crack detection monitoring system, 12:15695 (RA;US)
Turbine supervisory instrumentation, 12:15692 (RA;US)
Update on an acoustic doppler technique for detecting resonant turbine blades, 12:15708 (RA;US)
Water induction detection system: field testing, 12:15693 (RA;US)
Turbogenerators
Eddy current on-line monitoring for crack detection, 12:15706 (RA;US)
On-line diagnosis of turbine-generators using artificial intelligence, 12:15696 (RA;US)
San Diego Gas & Electric's vibration monitoring/reduction program, 12:15685 (RA;US)
Start-up support and trouble shooting for multi-bearing machine, 12:15686 (RA;US)
Turbine supervisory instrumentation, 12:15692 (RA;US)
Vibration signature analysis at Philadelphia Electric, 12:15690 (RA;US)
Wear
New approach for diagnostic monitoring of wear, erosion and corrosion in utility applications, 12:15704 (RA;US)
THERMAL SPRINGS
Geothermometry
Low-temperature geothermal assessment of the Santa Clara and Virgin River Valleys, Washington County, Utah, 12:15625 (R;US)
THERMONUCLEAR DEVICES
See also ICF DEVICES
Breeding Blankets
Tritium assay of Li/sub 2/O in the LBM/LOTUS experiments, 12:17527 (J;US)
THERMONUCLEAR FUELS
Cost Benefit Analysis
An evaluation of polarized fuels in a commercial deuterium/tritium tokamak reactor, 12:17539 (J;US)
THERMONUCLEAR POWER PLANTS
Availability
Three-state model for fusion reactor plant availability analysis, 12:17593 (J;US)
Computerized Simulation
Three-state model for fusion reactor plant availability analysis, 12:17593 (J;US)
Cost Estimation
A standard method for economic analyses of inertial confinement fusion power plants, 12:17590 (J;US)
Economic comparison of fusion power plant designs, 12:17592 (J;US)
Design
An assessment of multiplexed deployment of advanced commercial tokamaks, 12:17504 (J;US)
Economic comparison of fusion power plant designs, 12:17592 (J;US)
Economic Analysis
A standard method for economic analyses of inertial confinement fusion power plants, 12:17590 (J;US)
Economic comparison of fusion power plant designs, 12:17592 (J;US)
ICF Devices
A standard method for economic analyses of inertial confinement fusion power plants, 12:17590 (J;US)
P Codes
Three-state model for fusion reactor plant availability analysis, 12:17593 (J;US)
Reviews
Fusion power: One answer to U.S. energy needs in the 21st century, 12:17625 (BA;US)
Tokamak Type Reactors
An assessment of multiplexed deployment of advanced commercial tokamaks, 12:17504 (J;US)
Water Treatment
Water detritiation for present and future fusion plants, 12:17613 (J;US)
THERMONUCLEAR REACTIONS
(For use only with the phenomenon, not with THERMONUCLEAR REACTORS.)
Cross Sections
Requirements for charged-particle reaction cross sections in the d-d, d-t, t-t, and d-^{3}He fuel cycles, 12:17484 (R;US)

THERMONUCLEAR REACTOR MATERIALS

Ablation
Fusion surface material melting, ablation and ejection under high heat loading, 12:17579 (J;US)

Albedo
Fast and intermediate energy neutron albedos for fusion materials, 12:17623 (J;US)

Brittleness
Incorporating plastic collapse into the linear elastic fracture mechanics methodology in determining crack propagation lifetimes, 12:17574 (J;US)

Charpy Test
Recent progress in subsized Charpy impact specimen testing for fusion reactor materials development, 12:17573 (J;US)

Corrosion Products
FLiBe-vanadium alloy system corrosion product radiation hazards analysis, 12:17576 (J;US)

Crack Propagation
Incorporating plastic collapse into the linear elastic fracture mechanics methodology in determining crack propagation lifetimes, 12:17574 (J;US)

Data Base Management
COVFILS-2: Neutron data and covariances for sensitivity and uncertainty analysis, 12:17622 (J;US)

Evaporation
Scaling of vaporization and condensation in heavy ion fusion reactors, 12:17565 (J;US)

Fatigue
In-vacuum cyclic fatigue behavior of Vanstar-7 at elevated temperatures, 12:17583 (J;US)

Fracture Mechanics
Incorporating plastic collapse into the linear elastic fracture mechanics methodology in determining crack propagation lifetimes, 12:17574 (J;US)

Fracture Properties
Recent progress in subsized Charpy impact specimen testing for fusion reactor materials development, 12:17573 (J;US)

Heat Transfer
Uncertainties in liquid metal fusion blanket design windows, 12:17519 (J;US)

Magnetohydrodynamics
Uncertainties in liquid metal fusion blanket design windows, 12:17519 (J;US)

Mathematical Models
A model for the mechanical interaction between solid breeder and cladding materials, 12:17601 (J;US)

Melting
Fusion surface material melting, ablation and ejection under high heat loading, 12:17579 (J;US)

Neutron Transport Theory
Fast and intermediate energy neutron albedos for fusion materials, 12:17623 (J;US)

Physical Radiation Effects
First wall structural analysis of the aqueous self-cooled blanket concept, 12:17600 (J;US)
FLiBe-vanadium alloy system corrosion product radiation hazards analysis, 12:17576 (J;US)
Irradiation devices for fusion reactor materials results obtained from irradiated lithium aluminate at the OSIRIS reactor, 12:17429 (R;FR)
Laser generation of particles to simulate aerosols from fusion systems, 12:17552 (J;US)

Pressure Drop
Uncertainties in liquid metal fusion blanket design windows, 12:17519 (J;US)

Pressure Effects
Some safety considerations of liquid lithium as a fusion breeder material, 12:17549 (J;US)

Reliability
IPFR, Integrated Pool Fusion Reactor Concept, 12:17497 (J;US)

Safety
IPFR, Integrated Pool Fusion Reactor Concept, 12:17497 (J;US)
Some safety considerations of liquid lithium as a fusion breeder material, 12:17549 (J;US)

Strains
In-vacuum cyclic fatigue behavior of Vanstar-7 at elevated temperatures, 12:17583 (J;US)

Swelling
A model for the mechanical interaction between solid breeder and cladding materials, 12:17601 (J;US)

Temperature Effects
First wall structural analysis of the aqueous self-cooled blanket concept, 12:17600 (J;US)
Fusion surface material melting, ablation and ejection under high heat loading, 12:17579 (J;US)
In-vacuum cyclic fatigue behavior of Vanstar-7 at elevated temperatures, 12:17583 (J;US)
Some safety considerations of liquid lithium as a fusion breeder material, 12:17549 (J;US)

Vapor Condensation
Scaling of vaporization and condensation in heavy ion fusion reactors, 12:17565 (J;US)

Yield Strength
Recent progress in subsized Charpy impact specimen testing for fusion reactor materials development, 12:17573 (J;US)

THERMONUCLEAR REACTORS

For use in cases where certain aspects of either hypothetical or real thermonuclear reactors are discussed.

ION BEAM FUSION REACTORS
LASER FUSION REACTORS
TOKAMAK TYPE REACTORS

Benchmarks
U.S./JAERI calculational benchmarks for nuclear data and codes intercomparison, 12:17589 (J;US)

Breeding Blankets
A model for the mechanical interaction between solid breeder and cladding materials, 12:17601 (J;US)
Applications of the Integrated-Blanket-Coil concept to the compact reversed-field pinch reactor, 12:17498 (J;US)
Entry length effects in liquid metal fusion blankets, 12:17521 (J;US)
Experimental and analytical investigations of magnetohydrodynamic flows near the entrance to a strong magnetic field, 12:17522 (J;US)
First wall structural analysis of the aqueous self-cooled blanket concept, 12:17600 (J;US)
Fission reactor experiments for solid breeder blankets, 12:17531 (J;US)
Geometrical, spectral and temporal differences between ICF and MCF reactors and their impact on blanket nuclear parameters, 12:17597 (J;US)
Neutronic optimization of a LiAlO/sub 2/ solid breeder blanket, 12:17604 (J;US)
Nuclear performance optimization of the molten-salt fusion breeder, 12:17534 (J;US)
Required momentum, heat, and mass transport experiments for liquid metal blankets, 12:17530 (J;US)
Status of fusion reactor blanket design, 12:17510 (J;US)
Technical requirements of experiments and facilities for fusion nuclear technology, 12:17529 (J;US)
Techniques for measurement of velocity in liquid-metal MHD flows, 12:17518 (J;US)
The bowing of solid breeder rods in a pin-type fusion reactor, 12:17602 (J;US)
Thermodynamic performance of ceramic tritium breeding blanket material, 12:17580 (J;US)
Trade-off study of liquid metal self-cooled blankets, 12:17595 (J;US)

Computer Codes
U.S./JAERI calculational benchmarks for nuclear data and codes intercomparison, 12:17589 (J;US)

Computer-Aided Design
Supercomputers and magnetic fusion energy, 12:17624 (BA;US)

Cryostats
Theoretical assessment of a proposal for the simplified determination of critical loads of elastic shells, 12:17437 (R;DE)

Data Base Management
U.S./JAERI calculational benchmarks for nuclear data and codes intercomparison, 12:17589 (J;US)
Design
Applications of the Integrated-Blanket-Coil concept to the compact reversed-field pinch reactor, 12:17498 (J;US)
Fusion reactor options and alternatives for the RFP, 12:17503 (J;US)
Geometrical, spectral and temporal differences between ICF and MCF reactors and their impact on blanket nuclear parameters, 12:17597 (J;US)
IPFR, Integrated Pool Fusion Reactor Concept, 12:17497 (J;US)
Radiation effects on structural ceramics in fusion, 12:17572 (J;US)
Superconducting magnet radiation effects in fusion reactors, 12:17575 (J;US)
Divertors
Applications of the Integrated-Blanket-Coil concept to the compact reversed-field pinch reactor, 12:17498 (J;US)
Engineering
Compact fusion engineering research facility based upon the LITE concept, 12:17500 (J;US)
F Codes
Issues and test requirements in radiation shielding of fusion reactors, 12:17532 (J;US)
First Wall
A model for first-wall thermal response to plasma energy deposition, 12:17517 (J;US)
First wall tile attachment using carbon-carbon composite fittings, 12:17582 (J;US)
First wall structural analysis of the aqueous self-cooled blanket concept, 12:17600 (J;US)
Isotope Production
Radioisotope production in fusion reactors, 12:17506 (J;US)
Limiters
Design window for liquid metal-cooled limiters, 12:17578 (J;US)
Materials Testing
Ceramics for fusion devices, 12:17629 (BA;US)
FLiBe-vanadium alloy system corrosion product radiation hazards analysis, 12:17576 (J;US)

Coordinates
Natural coordinates for the three-body problem in adiabatic approximation, 12:17378 (R;SU;In Russian)
Faddeev Equations
Solution of Faddeev differential equations for scattering problem in three identical particle system. Calculation algorithm. The finite-dimensional approximation method, 12:17177 (R;SU;In Russian)
Monte Carlo Method
Variational Monte Carlo calculations of few-body nuclei, 12:17206 (R;US)
THULIUM 163
Multipole Transitions
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
Rotational States
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
THULIUM 165
Multipole Transitions
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
Rotational States
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
THULIUM 167
Lifetime
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
Multipole Transitions
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
Rotational States
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
THULIUM 169
Multipole Transitions
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
Rotational States
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
THULIUM 171
Multipole Transitions
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
Rotational States
Probabilities of electromagnetic transitions in odd thulium nuclei, 12:17232 (R;SU;In Russian)
THULIUM OXIDES
X-Ray Fluorescence Analysis
X-ray fluorescence analysis of thulium oxide/oxalate for rare earth impurities, 12:16378 (R;IN)
TIBIA
In vivo determination of tibial lead by K x-ray fluorescence with a ^{109}Cd source, 12:16885 (R;US)
TIGHT SANDS
See SANDSTONES

TIME RESOLUTION
Laser Radiation
Streak camera and picosecond metrology of laser impulses running at high repetitive rates, 12:16602 (R;FR;In French)
TIME-OF-FLIGHT SPECTROMETERS
Double-arm time-of-flight spectrometer for the DEMAS installation, 12:16629 (R;SU;In Russian)
Neutron Detection
Time of flight spectrometer for the measurement of gamma correlated neutron spectra, 12:16627 (RA;CS)
TIN 120 TARGET
Proton Reactions
Noneikonal effects in cross sections of proton reactions on nuclei, 12:17282 (RA;SU;In Russian)
TIN COMPOUNDS
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
TITANIUM
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
X-Ray Fluorescence Analysis
Determination of Ti, Cr, Cu and Ta in niobium oxide by X-ray fluorescence method, 12:16381 (R;IN)
TITANIUM 46
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
TITANIUM 47
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
TITANIUM 48
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
TITANIUM 49
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
TITANIUM 50
Dimensions
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
Spectral Shift
Nuclear charge distribution in 1integral/sub 7/2/-shell nuclei from muonic x-ray measurements, 12:17222 (J;US)
TITANIUM ALLOYS
Chemical Composition
Fundamental corrosion characterization of high-strength titanium alloys, 12:16320 (BA;US)
Corrosion Resistance
Fundamental corrosion characterization of high-strength titanium alloys, 12:16320 (BA;US)
Mechanical Properties
Fundamental corrosion characterization of high-strength titanium alloys, 12:16320 (BA;US)
Phase Studies
Pt-Ti alloy formation from high-temperature reduction of a titania-impregnated Pt catalyst: implications for strong metal-support interaction, 12:16300 (J;US)
TITANIUM COMPOUNDS
See also TITANIUM OXIDES
Binding Energy
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Chemical Preparation
Synthesis, structure, and spectroscopic properties of early transition metal eta^2-iminoacyl complexes containing aryl oxide ligation, 12:16409 (J;US)
Crystal Structure
Synthesis, structure, and spectroscopic properties of early transition metal eta^2-iminoacyl complexes containing aryl oxide ligation, 12:16409 (J;US)
Electronic Structure
Estimated core electron binding energies and their application in the interpretation of valence ionization potentials, 12:16417 (J;US)
Molecular Structure
Synthesis, structure, and spectroscopic properties of early transition metal eta^2-iminoacyl complexes containing aryl oxide ligation, 12:16409 (J;US)
TITANIUM ISOTOPES
See also TITANIUM 46
TITANIUM 47
TITANIUM 48
TITANIUM 49
TITANIUM 50
Argon 40 Reactions
Search for impact parameter dependence of two-particle correlations using exclusive observables in nucleus-nucleus collisions at intermediate energies, 12:17219 (R;FR)
Neutron Reactions
Neutron reactions on Ti isotopes from near threshold to 20 MeV, 12:17271 (RA;CS)
TITANIUM OXIDES
Fracture Mechanics
Fracture mechanisms in lead zirconate titanate ceramics, 12:16338 (BA;US)
Heating
Pt-Ti alloy formation from high-temperature reduction of a titania-impregnated Pt catalyst: implications for strong metal-support interaction, 12:16300 (J;US)
Phase Transformations
High temperature Raman studies of phase transitions in thin film dielectrics, 12:16367 (J;US)
Reduction
Pt-Ti alloy formation from high-temperature reduction of a titania-impregnated Pt catalyst: implications for strong metal-support interaction, 12:16300 (J;US)
TMR REACTORS
After-Heat Removal
Passive decay heat removal in liquid-metal cooled reactors, 12:17548 (J;US)
Breeding Blankets
An inherently safe tandem mirror fusion blanket concept, 12:17512 (J;US)
Cost study of the ESPRESSO blanket for a tandem mirror reactor, 12:17599 (J;US)
Thermal-hydraulic study of the ESPRESSO blanket for a Tandem Mirror Reactor, 12:17605 (J;US)
ECR Heating
Design study and supporting experiments for an axially symmetric anchor for a tandem mirror, 12:17537 (J;US)
Loss Cone Instability
An alpha particle distribution function for mirror loss-cone type instability calculations, 12:17419 (J;US)
Loss of Flow
Passive decay heat removal in liquid-metal cooled reactors, 12:17548 (J;US)
Superconducting Magnets
Design study and supporting experiments for an axially symmetric anchor for a tandem mirror, 12:17537 (J;US)

TMX DEVICES
MHD Equilibrium
Parallel current flow in the Phaedrus tandem mirror machine, 12:17423 (BA;US)
Plasma Confinement
Recent operation of the tandem mirror experiment-upgrade, 12:17420 (BA;US)
Plasma Diagnostics
Neutral beam probe for potential measurements in Phaedrus minimum-B end plug, 12:17421 (BA;US)
Thermal Barriers
Recent operation of the tandem mirror experiment-upgrade, 12:17420 (BA;US)
TOKAMAK DEVICES
See also ALCATOR DEVICE
ASDEX TOKAMAK
COMPACT IGNITION TOKAMAK
SPHEROMAK DEVICES
TEXT DEVICES
Beam Injection Heating
Injection and trapping of intense neutralized ion beams in closed magnetic configuration, 12:17481 (RA;US)
Limiters
Surface analysis of a central part of the JET graphite limiter, 12:17435 (R;DE)
Magnetic Field Configurations
Broadband magnetic and density fluctuations in the TCA tokamak, 12:17412 (R;CH)
Plasma Density
Broadband magnetic and density fluctuations in the TCA tokamak, 12:17412 (R;CH)
Plasma Diagnostics
Plasma diagnostics: Detection of laser scattering: Final report, September 1, 1978 to August 31, 1982, 12:17400 (R;US)
Plasma Macroinstabilities
Magnetic reconnection in tokamaks, 12:17402 (RA;CS)
TOKAMAK FUSION CORE EXPERIMENT
See TFCX REACTORS

After-Heat Removal
Passive decay heat removal in liquid-metal cooled reactors, 12:17548 (J;US)
Breeding Blankets
Fusion blanket inherent safety assessment, 12:17547 (J;US)
In-situ MHD energy conversion for fusion, 12:17554 (J;US)
Lithium-cooled blankets for advanced tokamaks, 12:17520 (J;US)
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)
Steady-state and transient thermal hydraulics of a breeder-in-tube blanket design, 12:17603 (J;US)
Thin blanket designs for the Elongated Tokamak Commercial Reactor, 12:17515 (J;US)
Uncertainties in liquid metal fusion blanket design windows, 12:17519 (J;US)
Design
Advanced tokamak reactors based on the spherical torus (ATR/ST), 12:17502 (J;US)
An assessment of multiplexed deployment of advanced commercial tokamaks, 12:17504 (J;US)
TIBER II-An upgraded tokamak ignition/burn experimental reactor, 12:17499 (J;US)
Economic Analysis
An evaluation of polarized fuels in a commercial deuterium/tritium tokamak reactor, 12:17539 (J;US)
ECR Heating
Free electron masers for tokamak applications, 12:17542 (J;US)
Engineering
Advanced tokamak reactors based on the spherical torus (ATR/ST), 12:17502 (J;US)
Tokamak power systems studies at ANL, 12:17496 (J;US)
Equipment Interfaces
An assessment of multiplexed deployment of advanced commercial tokamaks, 12:17504 (J;US)
First Wall
Lithium-cooled blankets for advanced tokamaks, 12:17520 (J;US)
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)
Impurities
The tritium system for a tokamak with a self-pumped limiter, 12:17611 (J;US)
Joule Heating
Super high field ohmically heated tokamak operation, 12:17543 (J;US)
Limiters
Experimental modelling of eddy currents and deflection for tokamak limiters, 12:17584 (J;US)
Pump limiter experiments and engineering, 12:17577 (J;US)
The tritium system for a tokamak with a self-pumped limiter, 12:17611 (J;US)
Loss of Flow
Passive decay heat removal in liquid-metal cooled reactors, 12:17548 (J;US)
MHD Generators
In-situ MHD energy conversion for fusion, 12:17554 (J;US)
Modifications
TIBER II-An upgraded tokamak ignition/burn experimental reactor, 12:17499 (J;US)
Performance
An evaluation of polarized fuels in a commercial deuterium/tritium tokamak reactor, 12:17539 (J;US)
Plasma Disruption
Experimental modelling of eddy currents and deflection for tokamak limiters, 12:17584 (J;US)
Reactor Components
An assessment of multiplexed deployment of advanced commercial tokamaks, 12:17504 (J;US)
Research Programs
Tokamak power systems studies at ANL, 12:17496 (J;US)
Shields
Measurements of reactor-relevant electromagnetic effects with the FELIX facility, 12:17528 (J;US)
Thermonuclear Fuels
An evaluation of polarized fuels in a commercial deuterium/tritium tokamak reactor, 12:17539 (J;US)
Thermonuclear Ignition
Super high field ohmically heated tokamak operation, 12:17543 (J;US)
TIBER II-An upgraded tokamak ignition/burn experimental reactor, 12:17499 (J;US)
TOLUENE
Density
Viscosity of synfuel compounds and mixtures: Fifth quarterly progress report, 10/1/86-12/31/86, 12:15302 (R;US)
Viscosity
Viscosity of synfuel compounds and mixtures: Fifth quarterly progress report, 10/1/86-12/31/86, 12:15302 (R;US)
TOMATOES
Filtration
Hyperfiltration of tomato juice: pilot plant scale high temperature testing, 12:16853 (J;US)
Hyperfiltration of tomato juice during long term high temperature testing, 12:16854 (J;US)
TOMOGRAPHY
Computerized microtomography using synchrotron radiation from the NSLS [National Synchrotron Light Source], 12:16595 (R;US)
TORI
See also COMPACT TORUS
Maintenance
Automatic path-planning for a multilink articulated boom within the torus of a fusion reactor, 12:17438 (R;DE)
Manipulators
Automatic path-planning for a multilink articulated boom within the torus of a fusion reactor, 12:17438 (R;DE)

TOTAL CROSS SECTIONS
Data Covariances
The evaluation and application of redundant-cross-section covariances, 12:17202 (R;US)
TOTAL-ABSORPTION SPECTROMETERS
See SHOWER COUNTERS
TOWER FOCUS POWER PLANTS
See also BARSTOW SOLAR PILOT PLANT
Demonstration Plants
Technology program 'Gas-cooled Solar Tower Plant' (GAST) - analysis of the potential. Final report, 12:15618 (R;DE;In German)
Demonstration Programs
Technology program 'Gas-cooled Solar Tower Plant' (GAST) - analysis of the potential. Final report, 12:15618 (R;DE;In German)
Efficiency
Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain, 12:15621 (TG;FR)
TOXIC MATERIALS
Air Pollution
Locating and estimating air emissions from sources of ethylene oxide, 12:16724 (R;US)
Report on the parallel ambient sampling project for selected organic toxics. Final report, 12:16722 (R;US)
Genetic Effects
Environmental biomonitoring with feral rodent species (Peromyscus leucopus), 12:16900 (RA;US)
Organic Compounds
Report on the parallel ambient sampling project for selected organic toxics. Final report, 12:16722 (R;US)
Sampling
Report on the parallel ambient sampling project for selected organic toxics. Final report, 12:16722 (R;US)

URANIUM
Charges
Nuclear investment and fuel cycle costs. Short and long term evolution of uranium costs. Canadian perspective, 12:15406 (RA;XA)
Electrorefining
The application of electrorefining for recovery and purification of fuel discharged from the Integral Fast Reactor, 12:15383 (R;US)
Photometry
Technology transfer of kinetic phosphorimetry, 12:16392 (RA;US)
Production
Nuclear investment and fuel cycle costs. Short and long term evolution of uranium costs. Canadian perspective, 12:15406 (RA;XA)
Radionuclide Migration
Environmental protection support and assistance, 12:15443 (RA;US)
Solubility
Comparison of uranium release from spent fuel and unirradiated UO_2 in salt brine, 12:15447 (R;US)

Evaluation of Synroc-C as a second generation waste form, 12:15446 (R;US)
URANIUM 232
Retention
Deposition and early disposition of inhaled $^{233}UO_2(NO_3)_2$ and $^{233}UO_2(NO_3)_2$ in the rat, 12:16881 (J;US)
Tissue Distribution
Deposition and early disposition of inhaled $^{233}UO_2(NO_3)_2$ and $^{233}UO_2(NO_3)_2$ in the rat, 12:16881 (J;US)
URANIUM 233
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Retention
Deposition and early disposition of inhaled $^{233}UO_2(NO_3)_2$ and $^{233}UO_2(NO_3)_2$ in the rat, 12:16881 (J;US)
Tissue Distribution
Deposition and early disposition of inhaled $^{233}UO_2(NO_3)_2$ and $^{233}UO_2(NO_3)_2$ in the rat, 12:16881 (J;US)
URANIUM 234
Mass Spectroscopy
Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique, 12:16375 (R;IN)
Metabolism
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
Prenatal Exposure
Placental transfer of the actinides and related heavy elements, 12:16878 (R;US)
URANIUM 234 TARGET
Neutron Reactions
Chemical shifts of uranium neutron resonances, 12:17251 (RA;CS)
Energy dependence peculiarities of fragment mean kinetic energy at nuclei fission by neutrons, 12:17248 (RA;CS)
URANIUM 235
Gamma Spectroscopy
^{235}Uranium isotope abundance certified reference material for gamma spectrometry EC nuclear reference material 171 certification report, 12:16389 (R;FR)
Mass Spectroscopy
Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique, 12:16375 (R;IN)
URANIUM 235 TARGET
Neutron Reactions
/sup 235/U(n,f) fragment mass, kinetic energy and angular distributions at energies below 6 MeV - results and interpretation, 12:17246 (RA;CS)
Chemical shifts of uranium neutron resonances, 12:17251 (RA;CS)
Energy dependence of the neutron multiplicity P/sub nu/ in fast neutron induced fission of /sup 235,238/U and ^{239}Pu, 12:17239 (R;US)
Experimental study of γ-ray emission from neutron resonance fission of /sup 235/U, 12:17250 (RA;CS)
Uncertainties in scientific measurements, 12:17216 (R;US)
URANIUM 236
Mass Spectroscopy
Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique, 12:16375 (R;IN)
URANIUM 238
Mass Spectroscopy
Sequential mass spectrometric analysis of uranium and plutonium employing resin bead technique, 12:16375 (R;IN)
URANIUM 238 TARGET
Calcium 48 Reactions
Competition between fusion and quasi-fission in heavy ion induced reactions, 12:17242 (R;US)
Neutron Reactions
Chemical shifts of uranium neutron resonances, 12:17251 (RA;CS)
Energy dependence of the neutron multiplicity P/sub nu/ in fast neutron induced fission of /sup 235,238/U and ^{239}Pu, 12:17239 (R;US)
Setup for determination of elastic and inelastic scattered neutron angular distribution by means of neutron filters, 12:17252 (R;SU;In Russian)
URANIUM ALLOYS
See also URANIUM BASE ALLOYS
Magnetic Properties
Normal state magnetic behavior of (U/sub 1-x/RE/sub x/)Be_{13} pseudobinaries, 12:16284 (R;US)
Phase Studies
Phases in U-Si alloys, 12:16256 (R;US)
Physical Radiation Effects
Crystal structure stability and fission gas swelling in intermetallic uranium compounds, 12:16301 (J;NL)
Superconductivity
Normal state magnetic behavior of (U/sub 1-x/RE/sub x/)Be_{13} pseudobinaries, 12:16284 (R;US)
URANIUM BASE ALLOYS
Ductility
Ductility of materials under dynamic solicitations, 12:16243 (R;FR;In French and English)
URANIUM DIOXIDE
Compression Strength
On the correlation between fuel structure and mechanical properties of UO/sub 2/, 12:15378 (BA;US)
Computerized Simulation
On the correlation between fuel structure and mechanical properties of UO/sub 2/, 12:15378 (BA;US)
Corrosion Resistance
In-pile and out-of-pile corrosion behavior of thoria-urania pellets (LWBR [Light Water Breeder Reactor] Development program), 12:15857 (R;US)
Crystal Structure
On the correlation between fuel structure and mechanical properties of UO/sub 2/, 12:15378 (BA;US)
Fission Product Release
Release of tellurium and caesium from UO/sub 2/ in LWR fuel rods during irradiation, 12:15970 (BA;US)
Fracture Properties
On the correlation between fuel structure and mechanical properties of UO/sub 2/, 12:15378 (BA;US)
Fuel Rods
Relocation of zircaloy-clad uranium dioxide under severe accident conditions, 12:16027 (R;US)
Hardness
On the correlation between fuel structure and mechanical properties of UO/sub 2/, 12:15378 (BA;US)
Leaching
Comparison of uranium release from spent fuel and unirradiated UO_2 in salt brine, 12:15447 (R;US)
Nuclear Fuels
PWR [pressurized water reactor] fuel element behavior at temperatures up to 2350°C, 12:16023 (R;DE)
Solid Solutions
O/M ratio measurements of $(U,Gd)O_2$ solid solutions by gravimetry, 12:15814 (J;US)
URANIUM HEXAFLUORIDE
Dissociation
Multiphoton dissociation of UF6 at lambda = 16 μm in supersonic jets, 12:16400 (R;FR)
Road Transport
Validation study of the intertran model for assessing risks of transportation accidents: Road transport of uranium hexafluoride, 12:15489 (R;FR)
URANIUM II
See URANIUM 234
URANIUM MILLS
See FEED MATERIALS PLANTS
URANIUM NITRATES
Radioactive Waste Processing
Operation of a radiochemical uranium nitrate solidification facility, 12:15485 (J;US)
URANIUM NITRIDES
Quantitative Chemical Analysis
Semi-microdetermination of nitrogen in actinide compounds by Dumas method, 12:16376 (R;IN)

URANIUM OXIDES
See also URANIUM DIOXIDE
Computerized Simulation
Prediction of the UO/sub 2/ fission gas release data of Bellamy and Rich using a model recently developed by Combustion Engineering, 12:15971 (BA;US)
Fission Product Release
Prediction of the UO/sub 2/ fission gas release data of Bellamy and Rich using a model recently developed by Combustion Engineering, 12:15971 (BA;US)
URANIUM SILICIDES
Phase Studies
Phases in U-Si alloys, 12:16256 (R;US)
URANIUM X 1
See THORIUM 234
URANUS PLANET
Acetylene
Spectroscopic observations of the planets, 12:16986 (RA;US)
Albedo
Planetary optical and infrared imaging, 12:17022 (RA;US)
Visible phase curves of Uranus and Neptune and scattering in their atmospheres, 12:16993 (RA;US)
Brightness
Lunar and planetary studies, 12:16984 (RA;US)
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)
Deuterium Compounds
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions, 12:16989 (RA;US)
Planetary Fabry-Perot spectroscopy, 12:16992 (RA;US)
Spectroscopic observations of the planets, 12:16986 (RA;US)
Eclipse
Portable high speed photometry systems for observing occultations, 12:16974 (RA;US)
Heat Sources
Visible phase curves of Uranus and Neptune and scattering in their atmospheres, 12:16993 (RA;US)
Hydrogen
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions, 12:16989 (RA;US)
Methane
Infrared observations of planetary atmospheres, 12:16985 (RA;US)
Outer planet studies, 12:16981 (RA;US)
Microwave Spectra
Submillimeter and millimeter observations of solar system objects, 12:16983 (RA;US)
Nebulae
Planetary Fabry-Perot spectroscopy, 12:16992 (RA;US)
Planetary Atmospheres
Portable high speed photometry systems for observing occultations, 12:16974 (RA;US)
URANYL COMPLEXES
Molecular Structure
Synthesis and structure of $[(UO_2)_6(N_3)_{16}O_2]8^+$ $[(CH_3)_4N]8^+$, $2H_2O$, 12:16428 (R;FR)
Synthesis
Synthesis and structure of $[(UO_2)_6(N_3)_{16}O_2]8^+$ $[(CH_3)_4N]8^+$, $2H_2O$, 12:16428 (R;FR)
URBAN AREAS
Mass Transit Systems
National urban mass transportation statistics. 1983 Section 15 annual report. Transit financial and operating data reported for years ending between January 1, 1983 and December 31, 1983, 12:16210 (R;US)
National urban mass transportation statistics. 1981 Section 15 report. Transit financial and operating data reported for fiscal year ending between July 1, 1980 and June 30, 1981. Annual report, 12:16211 (R;US)
National urban mass transportation statistics. 1981 Section 15 report. Transit financial and operating data reported for fiscal year ending between July 1, 1980 and June 30, 1981. Supplement, 12:16212 (R;US)
National urban mass transportation statistics. Second annual report. Section 15 reporting system. Transit financial and operating data reported for fiscal year ending between July 1, 1979 and June 30, 1980, 12:16213 (R;US)
National urban mass transportation statistics. 1982 Section 15 annual report. Transit financial and operating data reported for fiscal year ending between July 1, 1981 and June 30, 1982, 12:16214 (R;US)

WATER MODERATOR
See WATER
WATER POLLUTION
Biological Indicators
Biological markers of environmental contaminants: analysis of P450 activities and adduct formation in aquatic and terrestrial species exposed to benzo(a)pyrene (Lepomis macrochirus; Ondatra zibethica; Blarina brevicauda), 12:16892 (RA;US)
Monitoring
Design of a drinking-water-quality monitoring program, 12:16783 (R;US)
WATER SOURCE HEAT PUMPS
Coefficient of Performance
Development of advanced water-to-water heat pumps in the range of 200- to 5000-kW thermal output: prestudy, 12:16206 (R;US)
WATER SUPPLY
Used in the sense of a public utility or of an engineered system (e.g., irrigation system) as contrasted to a natural system, for which use WATER RESOURCES.
Monitoring
Design of a drinking-water-quality monitoring program, 12:16783 (R;US)
WATER TREATMENT PLANTS
Air Pollution
Preliminary assessment of air emissions from aerated waste-treatment systems at hazardous-waste-treatment storage and disposal facilities. Final report, 12:16723 (R;US)
WATER VAPOR
Differential Cross Sections
Effects of phase on differential ionization cross sections, 12:17321 (RA;US)
Theoretical single differential cross sections for bare ions, 12:17315 (RA;US)
Ionization
Theoretical single differential cross sections for bare ions, 12:17315 (RA;US)
WATERBORNE PARTICLES

Bench-Scale Experiments
Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 45, Quarter ending December 31, 1985, 12:15353 (R;US)

Field Tests
Contracts for field projects and supporting research on enhanced oil recovery: Progress review No. 45, Quarter ending December 31, 1985, 12:15353 (R;US)

WAVE ENERGY CONVERTERS
Bending
Long spines with appendages. A report to the Wave Energy Steering Committee covering work supported by the United Kingdom Department of Energy, 12:15631 (R;GB)
Motion
Long spines with appendages. A report to the Wave Energy Steering Committee covering work supported by the United Kingdom Department of Energy, 12:15631 (R;GB)

WAVE POWER
Research Programs
Long spines with appendages. A report to the Wave Energy Steering Committee covering work supported by the United Kingdom Department of Energy, 12:15631 (R;GB)

WAVEGUIDES
Electromagnetic Fields
Phase velocity of wave in irregular waveguide in problems of synthesis, 12:16523 (R;SU)
Phase Velocity
Phase velocity of wave in irregular waveguide in problems of synthesis, 12:16523 (R;SU)

WAVES (SHOCK)
See SHOCK WAVES

WAZ 16
See NICKEL BASE ALLOYS

WEAK BOSON
See INTERMEDIATE VECTOR BOSONS

WEAK INTERACTIONS
Evolution of weak interactions, 12:17097 (R;XC)

WEAR
On-Line Measurement Systems
On-line wear monitoring in liquid metal reactors, 12:15847 (R;US)

WECS
See WIND TURBINES

WEIGHT INDICATORS
Remote Handling Equipment
Remote weighing of irradiated fuel pins at FFTF, 12:15997 (J;US)

WELDED JOINTS
Fracture Properties
Stress rupture properties of austenitic steel weld metals, 12:16271 (R;FR)
Inspection
Development and implementation of visual weld acceptance criteria for Brunswick Steam Electric Plant, 12:15786 (J;US)
Porosity
Porosity decrease in laser welds of stainless steel using plasma control, 12:16322 (BA;US)
Quality Assurance
Development and implementation of visual weld acceptance criteria for Brunswick Steam Electric Plant, 12:15786 (J;US)
Sample Preparation
Laser welding metallography (Of ultra-small parts), 12:16299 (R;US)
Tensile Properties
Tensile properties of austenitic steel weld metals, 12:16272 (R;FR)

WELDS
See WELDED JOINTS

WELL LOGGING EQUIPMENT
To be used only when the equipment itself is the topic of the paper; includes source, detector, and associated equipment.
Calibration
Low radioactivity spectral gamma calibration facility, 12:15347 (BA;US)
Design
Evaluation and design of a large spacing loop-loop electromagnetic tool, 12:15349 (BA;US)

WEST GERMANY
See FEDERAL REPUBLIC OF GERMANY

WEST VALLEY PROCESSING PLANT
Decommissioning
Decommissioning the world's first commercial nuclear fuel reprocessing facility, 12:15558 (RA;US)
Decontamination and decommissioning of extraction cell 3 at the West Valley Demonstration Project, 12:15522 (RA;US)
Decontamination of the chemical crane room and decontamination and decommissioning of the extraction chemical room at the West Valley Demonstration Project, 12:15544 (RA;US)
Decontamination
Decontamination and decommissioning of extraction cell 3 at the West Valley Demonstration Project, 12:15522 (RA;US)
Decontamination of the chemical crane room and decontamination and decommissioning of the extraction chemical room at the West Valley Demonstration Project, 12:15544 (RA;US)
Radioactive Wastes
Radioactive waste assay at the West Valley Demonstration Project, 12:15529 (RA;US)

WEST VIRGINIA
Oil Fields
Economic evaluation of a CO/sub 2/-enhanced oil recovery flood at the Rock Creek Field, Roane County, West Virginia, 12:15360 (BA;US)
Underground Mining
Regulation of surface subsidence in West Virginia, 12:15346 (BA;US)

WESTINGHOUSE STANDARD REACTOR
Prior to 1975, PWR/41 TYPE REACTORS was used.
Reactor Kinetics
Method of baffle/reflector region homogenization, 12:15816 (J;US)
Pin Power prediction in the Westinghouse Advanced Nodal Code, 12:15815 (J;US)
Steam Generators
Evaluation of feedwater systems for reactor scram reduction, 12:15818 (J;US)
Turbulence force correlation of PWR steam generator tube bundle flow, 12:15834 (J;US)

WET-TYPE COOLING TOWERS
See COOLING TOWERS

WHITE DWARF STARS
Pulsations
Pulsations of white dwarf stars with thick hydrogen or helium surface layers, 12:16963 (R;US)

WILD ANIMALS
Management
Resource management plan for the Oak Ridge Reservation: Volume 24, Threatened and endangered animal species, 12:16782 (R;US)

WILSON LOOP
Renormalization
Infrared asymptotics of perturbative QCD. Renormalization properties of the Wilson loops in higher orders of perturbation theory, 12:17170 (R;SU)

WIND
Monitoring
A low cost and easy to reproduce anemometer for basic wind data acquisition, 12:15633 (BA;US)
Significance of upper air meteorological conditions in Altamont Pass wind resource assessment, 12:15635 (BA;US)
Wind characteristics, northwest Texas region, 12:15634 (BA;US)
Wind speed variability in the California Altamont Pass area, 12:15657 (BA;US)
Velocimeters
Report on the comparison of measurements between two monostatic Doppler-SODAR's manufactured by REMTECH, 12:16686 (R;DE;In German)

WIND ENERGY CONVERSION SYSTEMS

ZEOLITES
Catalytic Effects
A new method of magnetic characterization of zeolite-cobalt catalysts: Quarterly technical progress report 5, Oct. 1, 1986 through Jan. 30, 1987, 12:16403 (R;US)
Chemical trapping of CO/H_2 surface species: Quarterly report, 12:15286 (R;US)
Synthesis and modification of zeolite catalysts for producing short-chain olefins from methanol and synthesis gas, 12:16405 (R;DE;In German)
NMR Spectra
A new method of magnetic characterization of zeolite-cobalt catalysts: Quarterly technical progress report 5, Oct. 1, 1986 through Jan. 30, 1987, 12:16403 (R;US)
Synthesis
Synthesis and modification of zeolite catalysts for producing short-chain olefins from methanol and synthesis gas, 12:16405 (R;DE;In German)
ZINC
Biological Localization
Microlocalization of brain zinc in zinc-deficient rats, 12:16907 (J;US)
Ecological Concentration
A review of the chemical record in lake sediment of energy related air pollution and its effects on lakes, 12:16733 (J;NL)
Emission Spectroscopy
Partition chromatograph separation-spectrometry for the determination of 29 trace elements in PuO/sub 2/, 12:16383 (R;CN;In Chinese)
Nutritional Deficiency
Microlocalization of brain zinc in zinc-deficient rats, 12:16907 (J;US)
ZINC ALLOYS
Physical Properties
Low temperature properties of $CeCu_6$ and related compounds, 12:16285 (R;US)
ZINC COMPLEXES
Oxidation
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
Photochemical Reactions
Photooxidation of tetraanionic sensitizer ions by dihexadecyl phosphate vesicle-bound viologens, 12:16425 (J;US)
ZINC COMPOUNDS
See also ZINC TELLURIDES
Air Pollution Control
Studies on air pollution by lead, zinc, iron, and 3,4-benzopyrene due to traffic in a small town, 12:16235 (R;DE;In German)
Environmental Impacts
Studies on air pollution by lead, zinc, iron, and 3,4-benzopyrene due to traffic in a small town, 12:16235 (R;DE;In German)
ZINC FLUORIDES
Phase Transformations
The role of point defects on structural phase transitions: Progress report for the year 1986-1987 (Li-doped $KMnF_3$, $KZnF_3$; $K(Ta,Nb)O_3$), 12:16355 (R;US)
ZINC TELLURIDES
Crystal Growth
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Microhardness
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
Photoconductivity
Zone leveling and solution growth of complex compound semiconductors in space. Final report, 1 May 1983-30 September 1986, 12:16361 (R;US)
ZIRCALOY
For unspecified Zircaloy alloys.
See also ZIRCALOY 2
ZIRCALOY 4
Fuel Cans
PWR [pressurized water reactor] fuel element behavior at temperatures up to 2350°C, 12:16023 (R;DE)
Relocation of zircaloy-clad uranium dioxide under severe accident conditions, 12:16027 (R;US)
ZIRCALOY 2
Quenching
Surface quenching of zirconium alloys by laser, 12:16246 (R;FR;In French)
ZIRCALOY 4
Quenching
Surface quenching of zirconium alloys by laser, 12:16246 (R;FR;In French)
ZIRCONIUM
Neutron Reactions
Neutron scattering on nuclei near A = 60 and A = 90, 12:17257 (R;US)
ZIRCONIUM 90 TARGET
Neutron Reactions
Structure effects in (n,α) reactions on Nd and Zr isotopes, 12:17228 (R;FR)
Proton Reactions
Noneikonal effects in cross sections of proton reactions on nuclei, 12:17282 (RA;SU;In Russian)
ZIRCONIUM 91 TARGET
Neutron Reactions
Structure effects in (n,α) reactions on Nd and Zr isotopes, 12:17228 (R;FR)
ZIRCONIUM ALLOYS
See also VANSTAR 7
ZIRCONIUM BASE ALLOYS

Atom Transport
Diffusion and ion mixing in amorphous alloys, 12:16249 (R;US)
Corrosion
Characteristics of corrosion behaviour of Zr 1% Nb WWER fuel claddings within 700 to 1000°C on long-term exposures, 12:15797 (R;SU)
Fuel Cans
Characteristics of corrosion behaviour of Zr 1% Nb WWER fuel claddings within 700 to 1000°C on long-term exposures, 12:15797 (R;SU)

ZIRCONIUM BASE ALLOYS
See also ZIRCALOY
Corrosion Resistance
Technique and preliminary results for in-reactor investigation of corrosion and mechanical behaviour of zirconium alloys under non-isothermal conditions, 12:16292 (R;SU;In Russian)
Radiation Effects
Technique and preliminary results for in-reactor investigation of corrosion and mechanical behaviour of zirconium alloys under non-isothermal conditions, 12:16292 (R;SU;In Russian)

ZIRCONIUM COMPOUNDS
See also ZIRCONIUM FLUORIDES
ZIRCONIUM OXIDES
Chemical Preparation
Synthesis, structure, and spectroscopic properties of early transition metal eta²-iminoacyl complexes containing aryl oxide ligation, 12:16409 (J;US)
Crystal Structure
Synthesis, structure, and spectroscopic properties of early transition metal eta²-iminoacyl complexes containing aryl oxide ligation, 12:16409 (J;US)
Molecular Structure
Synthesis, structure, and spectroscopic properties of early transition metal eta²-iminoacyl complexes containing aryl oxide ligation, 12:16409 (J;US)

ZIRCONIUM FLUORIDES
Spectra
Vibrational characteristics and structure of heavy metal fluoride glasses containing thorium and zirconium, 12:16334 (R;US)

ZIRCONIUM OXIDES
Crystal Defects
Theoretical studies of defects in binary and ternary oxides, 12:16329 (R;US)
Fracture Mechanics
Fracture mechanisms in lead zirconate titanate ceramics, 12:16338 (BA;US)
Fracture Properties
Transformation toughening in the $Al_2O_3Cr_2O_3$ /ZrO_2 - HPO_2 system: the effect of ZrO_2-HFO_2 content, 12:16337 (BA;US)
Metallurgical Effects
Transformation toughening in the $Al_2O_3Cr_2O_3$ /ZrO_2 - HPO_2 system: the effect of ZrO_2-HFO_2 content, 12:16337 (BA;US)
Phase Transformations
Theory of the energetics and nonclassical nucleation for the tetragonal-monoclinic transformation of zirconia, 12:16328 (R;US)

CONTRACT NUMBER INDEX

Numbers assigned to DOE contracts under which documents announced in this publication were prepared are included in this index.

Contract No.	Abstract No.	Report No.
AA03-76SF00034	**California Univ., Los Angeles, USA. Dept. of Physics; California Univ., Berkeley, USA. Dept. of Phys**	
	12:17388	Physics Letters [Section] B 181 NO. 3/4. 263-268 (4 Dec 1986).

REPORT NUMBER INDEX

The numbers assigned to reports cited in this publication appear in the first column of the index. Cross reference information and/or availability are included as appropriate. Abbreviations used in the availability column are elaborated at the end of the index. To expedite the filling of orders for reports from NTIS and OSTI, a file number in the form DE82000001 or TI82000001 appears in column 3. File numbers with DE prefixes may be used in ordering from both NTIS and OSTI. Numbers with TI prefixes are valid at OSTI only. Requesters are urged to use this file number where provided. In column 4, one or more DOE distribution categories are indicated, e.g., STD-10, MN-25. STD indicates distribution was made in full-size copy; MN indicates microcopy distribution; ND indicates no distribution was made. These category numbers are included to assist DOE librarians in responding to requests for reports in their collections. The UC (Unclassified Distribution Categories) are defined in DOE/TIC-4500, available from OSTI. The citation numbers are given in column 5. NOTE: DOE attempts to disseminate its information as broadly as possible. Even though a report may contain some degree of illegibility, it is believed that the report may still make a contribution. The presence of a 1, 2, or 3 following NTIS in the availability column denotes the document quality for microfiche (MF) and printed copy (PC) production: 1 = 92 to 95% legibility, available PC and MF; 2 = 88 to 91% legibility, available MF only; 3 = 87% or less legibility, available PC only. Employees of DOE or DOE contractors are urged to order from the Office of Scientific and Technical Information (OSTI); all others should order from the National Technical Information Service (NTIS).

REPORTS

A document cited in this publication is considered a "report" when it carries a unique identifying number (e.g., ANL-3130, BNL-4000, DP-150, etc.) as the first element of the citation. Usually, one or more of the following abbreviations will appear at or near the end of the citation, indicating the organization from which the document is available. If none of these abbreviations appears, the report should be requested from either the cited publisher or corporate source.

GPO Available from the Superintendent of Documents, U. S. Government Printing Office, Washington, DC 20402.

GPO Dep. Available for inspection or interlibrary loan at GPO depository libraries. Unlimited DOE reports are being sent to the GPO depository libraries. See inside back cover for list of the libraries. These reports are identified by report number, Supt. of Docs. Class Number (E 1.99:) and OSTI accession/file number, e.g., DE87003384.

NTIS For sale by the National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, VA 22161. Paper copy (PC) and other price codes are for domestic users; prices for foreign purchasers are, in most instances, twice the domestic price. There is only one microfiche (MF) price code, MF A01 ($6.50).

OSTI Available from the Office of Scientific and Technical Information (OSTI), U. S. Department of Energy, P. O. Box 62, Oak Ridge, TN 37831, Attn: Technical Information Division.

NOTE: DOE offices and contractors should order reports from OSTI; all others should order from NTIS. For additional information, see the introductory paragraph to the Report Number Index.

NTIS NORTH AMERICAN PRICE CODES

Most NTIS products and services are now announced by price codes and, therefore, without specific prices in NTIS journals, newsletters, and indexes.

The current dollar equivalent for each code is shown in the schedule below. Orders must list the accession number(s) and be accompanied by the total dollar amount from the current schedule.

NORTH AMERICAN CONTINENT PRICE SCHEDULE

Customers in Canada, United States, and Mexico, please use this price schedule; other addressees, write for PR-360-4.

MICROFICHE	EXCEPTIONAL	MAGNETIC TAPES	DISKETTES
A01 $6.50	E01 $7.50	T01 $150.00	D01 $ 50
	E02 10.50	T02 175.00	D02 75
PAPER COPY	E03 11.00	T03 300.00	D03 125
A02 $9.95	E04 13.50	T04 400.00	D04 175

PRICES EFFECTIVE JANUARY 1, 1987

U. S. DEPARTMENT OF COMMERCE

National Technical Information Service

5285 Port Royal Road, Springfield, Virginia 22161

NON-REPORT DOCUMENTS

BOOKS

Most books cited are available from commercial publishers. Order from the publisher or other source as given, not from OSTI.

CONFERENCE PAPERS

Individual conference papers (or preprints) not available as reports should be requested from the originator or other source as cited.

CONFERENCE PROCEEDINGS

Many proceedings are available from commercial publishers; in other cases, request from the society, organization, institution, etc., cited as the source.

DISSERTATIONS (THESES)

Available from University Microfilms International, Dissertation Copies, P. O. Box 1764, Ann Arbor, MI 48106. Request by order number cited, e.g., 87-22,350.

JOURNAL ARTICLES

Users must use their own resources to obtain (or scan) articles cited—local, state, or university libraries or publishers, reprint services, etc.

MONOGRAPHS

Request from the organization, institution, society, etc., responsible for the monograph.

PATENTS

Although not cataloged as reports, patents cited from each country are listed in the Report Number Index under PATENTS-AU, PATENTS-FR, PATENTS-US, etc. U. S. Patent Applications (e.g., A 293,415) are available from NTIS.

CODES USED ON INDEX LINES

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R;SU;RU). The language designator does not appear if the document is published in English.

Energy Abstracts for Policy Analysis (EAPA), a monthly abstract journal, provides its readers an authority from which they can obtain energy-related nontechnological or quasitechnological articles or reports having significant reference value. Citations included in *EAPA* are selected based strictly on content, with only substantive articles included. This selectivity in scope and coverage is effected to emphasize references dealing with policy; legislative and regulatory factors; social, economic, and environmental impacts; and with programmatic efforts.

Department of Energy components can receive *Energy Abstracts for Policy Analysis* from the Office of Scientific and Technical Information. The publication also is available on an exchange basis to universities, research institutions, industrial firms, and publishers of scientific information. Inquiries should be directed to the Technical Information Division, Office of Scientific and Technical Information, P. O. Box 62, Oak Ridge, TN 37831.

Subscriptions to *EAPA* are available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The subscription rate for 12 monthly issues plus the annual index is $72.00 for domestic subscribers and $90.00 for subscribers outside the North American continent. The annual index is available separately to subscribers for $16.00 (domestic) or $20.00 (for those outside the North American continent). A single issue costs $5.00 (domestic) or $6.25 (outside the North American continent).

FEDERAL DEPOSITORY LIBRARY PROGRAM

As a result of an agreement between the U. S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
